Sun SNMP Management Agent Addendum for the Netra 240 Server

This document describes how the Netra™ 240 server fans, power supplies, and LED indicators are represented in the Sun™ Simple Network Management Protocol (SNMP) Agent for Sun Fire™ and Netra Systems. This document contains the following sections:

- [“Sun SNMP Management Agent” on page 2](#)
- [“Netra 240 Server SNMP Containment Model” on page 2](#)
- [“Component and Indicator Identification” on page 7](#)
- [“Fans” on page 11](#)
- [“Power Supplies” on page 14](#)
- [“Dry Contact Alarm Relays and LED Indicators” on page 18](#)

Note – For instructions on installing and using the Sun SNMP Management Agent, refer to the *Sun SNMP Management Agent for Sun Fire and Netra Systems* (817-2559-xx) manual. See [“Sun SNMP Management Agent” on page 2](#) for more information.

Sun SNMP Management Agent

The Sun SNMP Management Agent for Sun Fire and Netra Systems provides the management of supported systems using the Simple Network Management Protocol (SNMP). Using the Sun SNMP Management Agent, you can monitor inventory, configuration, and service indicators, as well as environmental and fault reports.

You can download the Sun SNMP Management Agent for Sun Fire and Netra Systems software and documentation at the following web site:

http://www.sun.com/servers/entry/sun_management.html

For instructions on installing and configuring the software, refer to the *Sun SNMP Management Agent for Sun Fire and Netra Systems* (817-2559-xx). The SNMP management agent manual contains a detailed overview of the agent software, including an introduction to the SNMP environment and a description of how the agent models hardware platforms using the Sun Platform SNMP model (SunPSM). The manual also describes how the SNMP interface presents managed objects and their relationships using the ENTITY-MIB and SUN-PLATFORM-MIB management information bases (MIB).

This document supplements the *Sun SNMP Management Agent for Sun Fire and Netra Systems* manual by documenting how the agent represents the Netra 240 server fans, power supplies, and certain LED indicators. This document provides Netra 240 server-specific information only. For complete descriptions of the SNMP agent terminology, management models, and trap properties, refer to the *Sun SNMP Management Agent for Sun Fire and Netra Systems* manual.

For additional information about the Netra 240 server, refer to the server's documentation at the following web site:

http://www.sun.com/products-n-solutions/hardware/docs/Servers/Netra_Servers/Netra_240/

Netra 240 Server SNMP Containment Model

TABLE 1 presents an example of how the Sun SNMP agent models the Netra 240 server component hierarchy. Because this component hierarchy may vary depending on your server and the SNMP agent software version, query the SNMP agent to identify your server's hierarchy. To locate these server components, see the figures in "Component and Indicator Identification" on page 7.

* While the service-required indicator is represented in the containment model, it is not supported.

Component and Indicator Identification

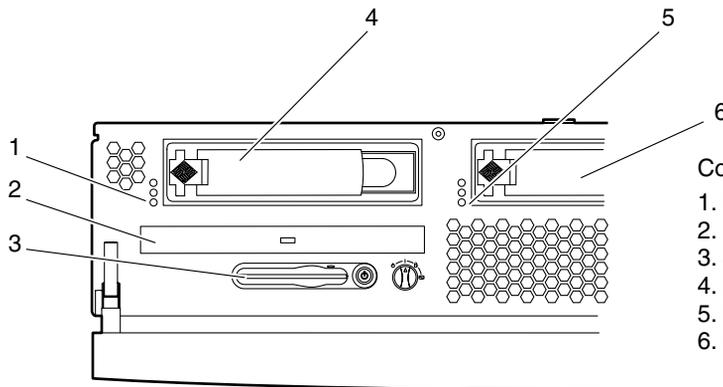

The following figures show the location of the Netra 240 server components. [TABLE 1](#) lists of how the agent models these components in an SNMP hierarchy.

Indicators:

1. System locator
2. System service-required
3. System active
4. Critical alarm
5. Major alarm
6. Minor alarm
7. User alarm

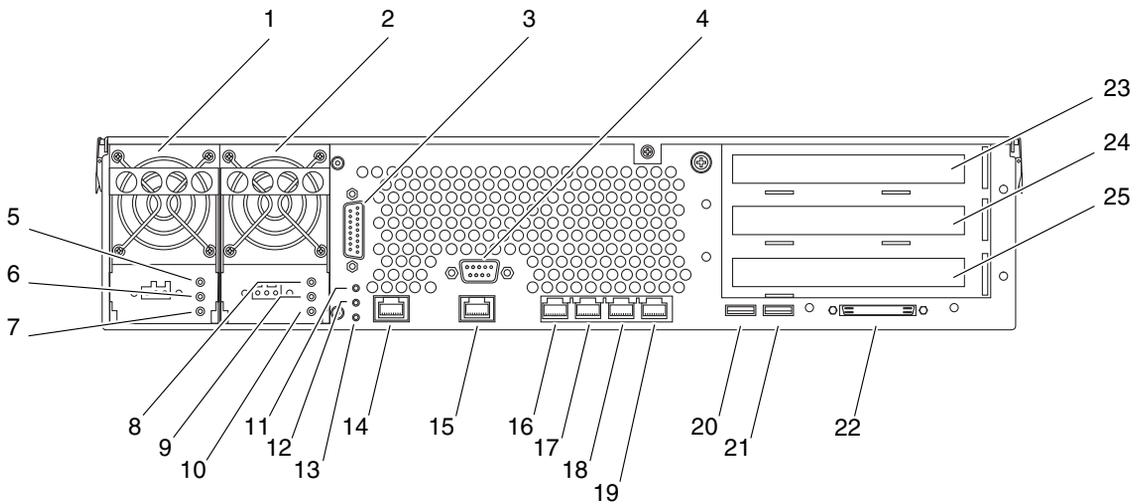

FIGURE 1 Front Panel Indicators

Components and indicators:

1. Hard disk drive (HDD) 0 okay-to-remove
2. DVD bay and drive
3. System configuration card and slot
4. HDD 0 drive and bay
5. HDD 1 okay-to-remove
6. HDD 1 drive and bay

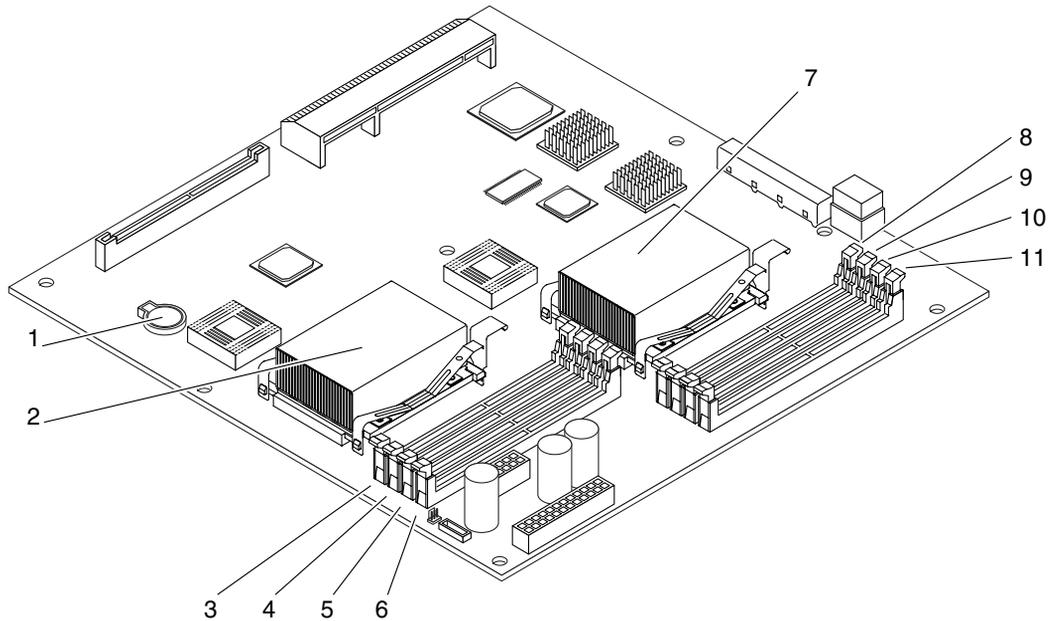

FIGURE 2 Front Panel Components and Indicators

Components, connectors, and indicators:

- | | |
|---------------------------------------|-----------------------------|
| 1. Power supply (PS) 0 bay and supply | 15. Management serial port |
| 2. PS 1 bay and supply | 16. NET 0 network interface |
| 3. Alarm port | 17. NET 1 network interface |
| 4. Asynchronous serial port | 18. NET 2 network interface |
| 5. PS 0 active | 19. NET 3 network interface |
| 6. PS 0 service required | 20. USB 0 port |
| 7. PS 0 okay-to-remove | 21. USB 1 port |
| 8. PS 1 activity | 22. SCSI port |
| 9. PS 1 service required | 23. PCI card slot 2 |
| 10. PS 1 okay-to-remove | 24. PCI card slot 1 |
| 11. System active | 25. PCI card slot 0 |
| 12. System service required | |
| 13. System locator | |
| 14. Management network port | |

| 4. CPU 1 Memory bank 0 DIMM 1 and slot | 10. CPU 0 Memory bank 1 DIMM 0 and slot |
| 5. CPU 1 Memory bank 1 DIMM 0 and slot | 11. CPU 0 Memory bank 1 DIMM 1 and slot |
| 6. CPU 1 Memory bank 1 DIMM 1 and slot | |

FIGURE 4 Motherboard (System Board) Components

Internal Components

- 1. Hardware cryptographic module and slot
- 2. Rear fan tray assembly (containing fans 0 and 1)
- 3. Front fan assembly (containing fans 2 and 3)
- 4. Alarm board

FIGURE 5 Internal Components

Fans

The Netra 240 server fans are identified in the ENTITY-MIB::entPhysicalTable by the entPhysicalDescr of Fan *number*, where *number* is a number in the range from 0 to 3. The fans are represented in the following tables that extend the entPhysicalTable:

- SUN-PLATFORM-MIB::sunPlatEquipmentTable
- SUN-PLATFORM-MIB::sunPlatFanTable

Each fan contains a tachometer used to indicate the current speed of the fan expressed in revolutions per minute (RPM). The tachometers are identified by their entPhysicalDescr of Fan *number* Tachometer, where *number* is a number in the range from 0 to 3 corresponding to the fan being monitored. The fan tachometers are represented in the following tables that extend the entPhysicalTable:

- SUN-PLATFORM-MIB::sunPlatEquipmentTable
- SUN-PLATFORM-MIB::sunPlatSensorTable
- SUN-PLATFORM-MIB::sunPlatNumericSensorTable

Fan Failures

If the speed of a fan falls below the threshold indicated by its tachometer's sunPlatNumericSensorLowerThresholdNonCritical value, the fan is considered to have failed and the following will occur:

- The sunPlatEquipmentOperationalState value for the fan will change from enabled(2) to disabled(1) and a sunPlatStateChange trap will be generated with the form shown in [TABLE 2](#).
- A sunPlatEnvironmentalAlarm trap with a sunPlatNotificationPerceivedSeverity value of warning(5) will be generated for the fan with the form shown in [TABLE 3](#).
- The sunPlatEquipmentAlarmStatus value for the fan will change from cleared(7) to warning(5) and a sunPlatAttributeChangeInteger trap will be generated with the form shown in [TABLE 4](#).
- The sunPlatAlarmState values for the status LEDs will change and sunPlatAttributeChangeInteger traps will be generated with the form shown in [TABLE 5](#).

If the fan recovers from the failure, the following changes will occur:

- The sunPlatEquipmentOperationalState value for the fan will change from disabled(1) to enabled(2) and a sunPlatStateChange trap will be generated with the form shown in [TABLE 2](#).

- A sunPlatEnvironmentalAlarm trap with a sunPlatNotificationPerceivedSeverity value of cleared(6) will be generated for the fan with the form shown in TABLE 3.
- The sunPlatEquipmentAlarmStatus value for the fan will change from warning(5) to cleared(7) and a sunPlatAttributeChangeInteger trap will be generated with the form shown in TABLE 4.
- The sunPlatAlarmState values for the status LEDs will change and sunPlatAttributeChangeInteger traps will be generated with the form shown in TABLE 5.

TABLE 2 sunPlatStateChange Trap for a Fan Failure or Recovery

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	entPhysicalDescr, <i>fan instance</i> *
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationChangedOID	sunPlatEquipmentOperationalState, <i>fan instance</i> *
sunPlatNotificationOldInteger	disabled(1) or enabled(2)
sunPlatNotificationNewInteger	disabled(1) or enabled(2)

* *fan instance* indicates the row in the entPhysicalTable associated with the fan.

TABLE 3 sunPlatEnvironmentalAlarm Trap for a Fan Failure or Recovery

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	entPhysicalDescr, <i>fan instance</i> *
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationAdditionalInfo	0.0 (null)
sunPlatNotificationAdditionalText	<i>entPhysicalName of the fan tachometer</i> : Tachometer threshold crossed
sunPlatNotificationPerceivedSeverity	warning(5) or cleared(6)
sunPlatNotificationProbableCause	coolingFanFailure(107)
sunPlatNotificationSpecificProblem	coolingFanFailure
sunPlatNotificationRepairAction	

* *fan instance* indicates the row in the entPhysicalTable associated with the fan.

TABLE 4 sunPlatAttributeChangeInteger Trap for a sunPlatEquipmentAlarmStatus Change

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	entPhysicalDescr.fan <i>instance</i> *
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationChangedOID	sunPlatEquipmentAlarmStatus.fan <i>instance</i> *
sunPlatNotificationOldInteger	warning (5) or cleared (7)
sunPlatNotificationNewInteger	warning (5) or cleared (7)

* *fan instance* indicates the row in the entPhysicalTable associated with the fan.

TABLE 5 sunPlatAttributeChangeInteger Trap for a sunPlatAlarmState Change

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	entPhysicalDescr.fan <i>instance</i> *
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationChangedOID	sunPlatAlarmState.LED <i>instance</i> †
sunPlatNotificationOldInteger	off (2) or steady (3)
sunPlatNotificationNewInteger	off (2) or steady (3)

* *fan instance* indicates the row in the entPhysicalTable associated with the fan.

† *LED instance* indicates the row in the entPhysicalTable associated with the LED.

Detecting Fan Status

You can detect fan status using the following mechanisms:

- Polling sunPlatNumericSensorCurrent and sunPlatNumericSensorLowerThresholdNonCritical for the fan's tachometer and comparing their values.
- Polling the sunPlatEquipmentOperationalState of the fan.
- Receiving a sunPlatStateChange trap corresponding to the change of the sunPlatEquipmentOperationalState of the fan.
- Receiving a sunPlatEnvironmentalAlarm trap with a sunPlatNotificationProbableCause of coolingFanFailure (107).

Power Supplies

The power supplies are identified in the ENTITY-MIB::entPhysicalTable by the entPhysicalDescr of Power Supply *number* (*side* viewed from rear) where *number* is 0 or 1, and *side* is left when *number* is 0 and right when *number* is 1. The power supplies are represented in the SUN-PLATFORM-MIB::sunPlatEquipmentTable.

Each power supply contains the following sensors:

- Power Inlet Presence Monitor
- Fan Under-Speed Fault Monitor
- Over-Voltage Fault Monitor
- Under-Voltage Fault Monitor
- Over-Temperature Fault Monitor

These sensors are represented in the following tables:

- SUN-PLATFORM-MIB::sunPlatEquipmentTable
- SUN-PLATFORM-MIB::sunPlatSensorTable
- SUN-PLATFORM-MIB::sunPlatBinarySensorTable

Power Supply Failures

If any of the power supply sensors detect a fault the following changes will occur:

- The sunPlatBinarySensorCurrent value for the sensor that detected the fault will change from true(1) to false(2) and a sunPlatAttributeChangeInteger trap will be generated with the form shown in [TABLE 6](#).
- The sunPlatEquipmentOperationalState for the power supply will change from enabled(2) to disabled(1) and a sunPlatStateChange trap will be generated with the form shown in [TABLE 7](#).
- A sunPlatEquipmentAlarm trap for the power supply will be generated with the form shown in [TABLE 8](#).
- The sunPlatEquipmentAlarmStatus value for the power supply will change from cleared(7) to major(2) and a sunPlatAttributeChangeInteger trap will be generated with the form shown in [TABLE 9](#).
- The sunPlatAlarmState values for the status LEDs will change and sunPlatAttributeChangeInteger traps will be generated with the form shown in [TABLE 10](#).

Recovery from the power supply fault will result in the following changes:

- The `sunPlatBinarySensorCurrent` value for the sensor that detected the fault will change from `false(2)` to `true(1)` and a `sunPlatAttributeChangeInteger` trap will be generated with the form shown in [TABLE 6](#).
- The `sunPlatEquipmentOperationalState` for the power supply will change from `disabled(1)` to `enabled(2)` and a `sunPlatStateChange` trap will be generated with the form shown in [TABLE 7](#).
- A `sunPlatEquipmentAlarm` trap with a `sunPlatNotificationPerceivedSeverity` value of `cleared(6)` will be generated for the power supply with the form shown in [TABLE 8](#).
- The `sunPlatEquipmentAlarmStatus` value for the power supply will change from `major(2)` to `cleared(7)` and a `sunPlatAttributeChangeInteger` trap will be generated with the form shown in [TABLE 9](#).
- The `sunPlatAlarmState` values for the status LEDs will change and `sunPlatAttributeChangeInteger` traps will be generated with the form shown in [TABLE 10](#).

TABLE 6 `sunPlatAttributeChangeInteger` Trap for a Power Supply Sensor

Variable	Value
<code>sunPlatNotificationEventId</code>	<i>unique numeric identifier</i>
<code>sunPlatNotificationTime</code>	<i>date time</i>
<code>sunPlatNotificationObject</code>	<code>entPhysicalDescr.ps sensor instance*</code>
<code>sunPlatNotificationCorrelatedNotifications</code>	
<code>sunPlatNotificationChangedOID</code>	<code>sunPlatBinarySensorCurrent.ps sensor instance*</code>
<code>sunPlatNotificationOldInteger</code>	<code>true(1)</code> or <code>false(2)</code>
<code>sunPlatNotificationNewInteger</code>	<code>true(1)</code> or <code>false(2)</code>

* *ps sensor instance* indicates the row in the `entPhysicalTable` associated with the power supply sensor.

TABLE 7 sunPlatStateChange Trap for a Power Supply Fault or Recovery

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	entPhysicalDescr. <i>ps instance</i> *
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationChangedOID	sunPlatEquipmentOperationalState. <i>ps instance</i> *
sunPlatNotificationOldInteger	disabled(1) or enabled(2)
sunPlatNotificationNewInteger	disabled(1) or enabled(2)

* *ps instance* indicates the row in the entPhysicalTable associated with the power supply.

TABLE 8 sunPlatEquipmentAlarm Trap for a Power Supply Fault or Recovery

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	entPhysicalDescr. <i>ps instance</i> *
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationAdditionalInfo	0.0 (null)
sunPlatNotificationAdditionalText	<i>entPhysicalName of the sensor: Voltage threshold crossed</i>
sunPlatNotificationPerceivedSeverity	major(3) or cleared(6)
sunPlatNotificationProbableCause	powerProblem(58)
sunPlatNotificationSpecificProblem	powerProblem
sunPlatNotificationRepairAction	

* *ps instance* indicates the row in the entPhysicalTable associated with the power supply.

TABLE 9 *sunPlatAttributeChangeInteger* Trap for a sunPlatEquipmentAlarmStatus Change

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	<i>entPhysicalDescr.ps instance*</i>
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationChangedOID	<i>sunPlatEquipmentAlarmStatus.ps instance*</i>
sunPlatNotificationOldInteger	<i>major (2) or cleared (7)</i>
sunPlatNotificationNewInteger	<i>major (2) or cleared (7)</i>

* *ps instance* indicates the row in the entPhysicalTable associated with the power supply.

TABLE 10 *sunPlatAttributeChangeInteger* Trap for a sunPlatAlarmState Change

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	<i>entPhysicalDescr.LED instance*</i>
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationChangedOID	<i>sunPlatAlarmState.LED instance*</i>
sunPlatNotificationOldInteger	<i>off (2) or steady (3)</i>
sunPlatNotificationNewInteger	<i>off (2) or steady (3)</i>

* *LED instance* indicates the row in the entPhysicalTable associated with the LED.

Detecting Power Supply Status

You can use the following mechanisms to detect power supply status:

- Poll the value of sunPlatBinarySensorCurrent for each of the power supply sensors.
- Poll the value of sunPlatEquipmentOperationalState for the power supply.
- Receiving a sunPlatAttributeChangeInteger trap corresponding to a change in the sunPlatBinarySensorCurrent value for one of the power supply sensors.
- Receiving a sunPlatStateChange trap corresponding to a change in the sunPlatEquipmentOperationalState for the power supply.
- Receiving a sunPlatEquipmentAlarm trap with a sunPlatNotificationProbableCause value of powerProblem(58).

Dry Contact Alarm Relays and LED Indicators

The Netra 240 server has four dry contact alarm relays and four corresponding LED indicators. The alarm relays are identified in the ENTITY-MIB::entPhysicalTable by the following entPhysicalDescr values:

- Critical Alarm Relay
- Major Alarm Relay
- Minor Alarm Relay
- User Alarm Relay

The alarm LED indicators are identified in the ENTITY-MIB::entPhysicalTable by the following entPhysicalDescr values:

- Critical Alarm Indicator (front)
- Major Alarm Indicator (front)
- Minor Alarm Indicator (front)
- User Alarm Indicator (front)

The alarm relays and the alarm LED indicators are represented in the SUN-PLATFORM-MIB::sunPlatAlarmTable which extends the ENTITY-MIB::entPhysicalTable.

Alarm State Changes

The alarm relay state cannot be changed using SNMP set commands. However, the alarm relay state can be changed using the Sun Advanced Lights Out Manager (ALOM) `setalarm` command. For more information about ALOM commands, refer to the *Sun Advanced Lights Out Manager Software User's Guide for the Netra 240 Server* (817-3174-xx).

The alarm relay states can also be changed using the alarm relay output application programming interface (API). For information about this API, refer to the *Netra 240 Server System Administration Guide* (817-2700-xx).

If one of the alarm relays changes its state, the sunPlatAlarmState values associated with the relay and its corresponding indicator change state, and sunPlatAttributeChangeInteger traps will be generated in the format shown in [TABLE 11](#).

TABLE 11 sunPlatAttributeChangeInteger Trap for a sunPlatAlarmState Change

Variable	Value
sunPlatNotificationEventId	<i>unique numeric identifier</i>
sunPlatNotificationTime	<i>date time</i>
sunPlatNotificationObject	entPhysicalDescr. <i>instance</i> *
sunPlatNotificationCorrelatedNotifications	
sunPlatNotificationChangedOID	sunPlatAlarmState. <i>instance</i> *
sunPlatNotificationOldInteger	off (2) or steady (3)
sunPlatNotificationNewInteger	off (2) or steady (3)

* *instance* indicates the row in the entPhysicalTable associated with the alarm relay or the alarm indicator.
