Send Us Your Comments

Oracle Database PL/SQL Packages and Types Reference, 10*g* Release 2 (10.2)
B14258-01

Oracle welcomes your comments and suggestions on the quality and usefulness of this publication. Your input is an important part of the information used for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most about this manual?

If you find any errors or have any other suggestions for improvement, please indicate the title and part number of the documentation and the chapter, section, and page number (if available). You can send comments to us in the following ways:

- Electronic mail: infodev_us@oracle.com
- FAX: (650) 506-7227. Attn: Server Technologies Documentation Manager
- Postal service:

  Oracle Corporation
  Server Technologies Documentation
  500 Oracle Parkway, Mailstop 4op11
  Redwood Shores, CA 94065
  USA

If you would like a reply, please give your name, address, telephone number, and electronic mail address (optional).

If you have problems with the software, please contact your local Oracle Support Services.

Preface

This Preface contains these topics:

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming:

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

`http://www.oracle.com/accessibility/`

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, seven days a week. For TTY support, call 800.446.2398.

Structure

See Table 1–1, " Summary of Oracle Supplied PL/SQL Packages" for information about the organization of this reference.

Related Documents

You can find links in specific chapters to related documents. For general information, see these Oracle resources:

- *Oracle Database Application Developer's Guide - Fundamentals*
- *Oracle Database PL/SQL User's Guide and Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

`http://oraclestore.oracle.com/`

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

`http://otn.oracle.com/membership/`

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

`http://otn.oracle.com/documentation/`

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an **index-organized table**.
Italics	Italic typeface indicates book titles or emphasis.	*Oracle Database Concepts* Ensure that the recovery catalog and target database do *not* reside on the same disk.
`UPPERCASE monospace (fixed-width) font`	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a `NUMBER` column. You can back up the database by using the `BACKUP` command. Query the `TABLE_NAME` column in the `USER_TABLES` data dictionary view. Use the `DBMS_STATS.GENERATE_STATS` procedure.
`lowercase monospace (fixed-width) font`	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. *Note:* Some programmatic elements use a mixture of `UPPERCASE` and `lowercase`. Enter these elements as shown.	Enter `sqlplus` to start SQL*Plus. The password is specified in the `orapwd` file. Back up the datafiles and control files in the `/disk1/oracle/dbs` directory. The `department_id`, `department_name`, and `location_id` columns are in the `hr.departments` table. Set the `QUERY_REWRITE_ENABLED` initialization parameter to `true`. Connect as `oe` user. The `JRepUtil` class implements these methods.
`lowercase italic monospace (fixed-width) font`	Lowercase italic monospace font represents placeholders or variables.	You can specify the *`parallel_clause`*. Run *`old_release`*`.SQL` where *`old_release`* refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
`[ ]`	Anything enclosed in brackets is optional.	`DECIMAL (`*`digits`*` [ , `*`precision`*` ])`
`{ }`	Braces are used for grouping items.	`{ENABLE | DISABLE}`
`|`	A vertical bar represents a choice of two options.	`{ENABLE | DISABLE}` `[COMPRESS | NOCOMPRESS]`

Convention	Meaning	Example

`...`	Ellipsis points mean repetition in syntax descriptions.
	
	In addition, ellipsis points can mean an omission in code examples or text.
		`CREATE TABLE ... AS subquery;`
		
		`SELECT col1, col2, ... , coln FROM employees;`

Other symbols	You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (|), and ellipsis points (...) exactly as shown.	`acctbal NUMBER(11,2);` `acct    CONSTANT NUMBER(4) := 3;`
Italics	Italicized text indicates placeholders or variables for which you must supply particular values.	`CONNECT SYSTEM/system_password` `DB_NAME = database_name`

`UPPERCASE`	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	`SELECT last_name, employee_id FROM employees;`
		`SELECT * FROM USER_TABLES;`
		`DROP TABLE hr.employees;`

`lowercase`	Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.
	
	Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.
		`SELECT last_name, employee_id FROM employees;`
		`sqlplus hr/hr`
		`CREATE USER mjones IDENTIFIED BY ty3MU9;`

What's New in PL/SQL Packages and Types Reference?

The following sections describe the new features in Oracle PL/SQL Packages and Types Reference:

Oracle Database 10g Release 2 (10.2) New Features

New Packages

- DBMS_AQELM
- DBMS_AQIN
- DBMS_CHANGE_NOTIFICATION
- DBMS_DB_VERSION

- Logical Change Record TYPEs
- Rule TYPEs

1
Introduction

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

> **Note:** This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

This chapter contains the following topics:

- Package Overview
- Summary of Oracle Supplied PL/SQL Packages

> **See Also:** *Oracle Database Application Developer's Guide - Fundamentals* for information on how to create your own packages

Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

Packages have many advantages over standalone procedures and functions. For example, they:

- Let you organize your application development more efficiently.
- Let you grant privileges more efficiently.
- Let you modify package objects without recompiling dependent schema objects.
- Enable Oracle to read multiple package objects into memory at once.
- Let you *overload* procedures or functions. Overloading means creating multiple procedures with the same name in the same package, each taking arguments of different number or datatype.
- Can contain global variables and cursors that are available to all procedures and functions in the package.

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS  -- specification (visible part)
   -- public type and item declarations
   -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
   -- private type and item declarations
   -- subprogram bodies
[BEGIN
   -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created and the CATPROC.SQL script is run. For example, to create the DBMS_ALERT package, the DBMSALRT.SQL and PRVTALRT.PLB scripts must be run when connected as the user SYS. These scripts are run automatically by the CATPROC.SQL script.

Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have EXECUTE privileges on the function. To select from a view defined with a PL/SQL function, you must have SELECT privileges on the view. No separate EXECUTE privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

   You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   Note: It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE just` overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

   You can declare and define program objects in the package body.

   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

     See Also:

     - *Oracle Database PL/SQL User's Guide and Reference*
     - *Oracle Database Application Developer's Guide - Fundamentals*for more information on creating new packages
     - *Oracle Database Concepts*

     for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named EMPLOYEE_MANAGEMENT. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER;
   PROCEDURE fire_emp (emp_id NUMBER);
   PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
       new_empno    NUMBER(10);

   BEGIN
      SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
      INSERT INTO emp VALUES (new_empno, name, job, mgr,
         hiredate, sal, comm, deptno);
      RETURN (new_empno);
   END hire_emp;

   PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument emp_id. If no employee is found, then an exception is raised.

```
   BEGIN
      DELETE FROM emp WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
      raise_application_error(-20011, 'Invalid Employee
         Number: ' || TO_CHAR(emp_id));
   END IF;
END fire_emp;

PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. Emp_id is a number that corresponds to an employee number. Sal_incr is the amount by which to increase the employee's salary.

```
   BEGIN

   -- If employee exists, then update salary with increase.

      UPDATE emp
         SET sal = sal + sal_incr
         WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
         raise_application_error(-20011, 'Invalid Employee
```

```
            Number: ' || TO_CHAR(emp_id));
      END IF;
   END sal_raise;
END employee_management;
```

Note: If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
   > START WITH 8000 INCREMENT BY 10;
```

Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```

Summary of Oracle Supplied PL/SQL Packages

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

Table 1–1 Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
CTX_ADM	Lets you administer servers and the data dictionary.
CTX_CLS	Lets you generate CTXRULE rules for a set of documents.
CTX_DDL	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes.
CTX_DOC	Lets you request document services.
CTX_OUTPUT	Lets you manage the index log.
CTX_QUERY	Lets you generate query feedback, count hits, and create stored query expressions.
CTX_REPORT	Lets you create various index reports.
CTX_THES	Lets you to manage and browse thesauri.
CTX_ULEXER	For use with the user-lexer.
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite.
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements.
DBMS_ALERT	Provides support for the asynchronous notification of database events.
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes.
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process.
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message.
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP.
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces.
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Streams.
DBMS_CDC_PUBLISH	Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application.
DBMS_CDC_SUBSCRIBE	Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package.
DBMS_CHANGE_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CRYPTO	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms.
DBMS_DATA_MINING	Lets you use data mining to discover hidden patterns and use that knowledge to make predictions.
DBMS_DATA_MINING_TRANSFORM	Provides set of data transformation utilities available for use with the DBMS_DATA_MINING package for preparing mining data.
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata.
DBMS_DB_VERSION	Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs.
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units.
DBMS_DEFER	Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DEFER_QUERY	Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.
DMBS_DEFER_SYS	Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking.
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_DISTRIBUTED_TRUST_ ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted.
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener.
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back.
DBMS_EXPFIL	Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.
DBMS_FGA	Provides fine-grained security functions.
DBMS_FILE_GROUP	One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories.
DMBS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases.
DMBS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting.
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems.
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command.
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JOB	Lets you schedule administrative procedures that you want performed at periodic intervals; it is also the interface for the job queue.
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers.
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP.
DBMS_LIBCACHE	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution.
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILEs (read-only).
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services.
DBMS_LOGMNR	Provides functions to initialize and run the log reader.
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents.
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary.
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing.
DBMS_MGWMSG	Describes object types—used by the canonical message types to convert message bodies—and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering.
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_OBFUSCATION_TOOLKIT	Provides procedures for Data Encryption Standards.
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function.
DBMS_OFFLINE_OG	Provides public APIs for offline instantiation of master groups.
DBMS_OLAP	Provides procedures for summaries, dimensions, and query rewrites.
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines. Synonymous with OUTLN_PKG
DBMS_OUTLN_EDIT	Lets you edit an invoker's rights package.
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later.
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes.
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions.
DBMS_PREDICTIVE_ANALYTICS	Automates the data mining process from data preprocessing through model building to scoring new data.
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks.
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue.
DBMS_RANDOM	Provides a built-in random number generator.
DBMS_RECTIFIER_DIFF	Provides APIs used to detect and resolve data inconsistencies between two replicated sites.
DBMS_REDEFINITION	Lets you perform an online reorganization of tables.
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time. Requires the Distributed Option.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_REPAIR	Provides data corruption repair procedures.
DBMS_REPCAT	Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.
DBMS_REPCAT_ADMIN	Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.
DBMS_REPCAT_INSTATIATE	Instantiates deployment templates. Requires the Replication Option.
DBMS_REPCAT_RGT	Controls the maintenance and definition of refresh group templates. Requires the Replication Option.
DBMS_REPUTIL	Provides routines to generate shadow tables, triggers, and packages for table replication.
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema.
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups.
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution.
DBMS_RLMGR	Contains various procedures to create and manage rules and rule sessions by the Rules Manager.
DBMS_RLS	Provides row level security administrative interface.
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents.
DBMS_RULE	Describes the EVALUATE procedure used in Streams.
DBMS_RULE_ADM	Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams.
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program.
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated.
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance.
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures.
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism.
DBMS_SPACE	Provides segment space information not available through standard SQL.
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL.
DBMS_SQL	Lets you use dynamic SQL to access the database.
DBMS_SQLTUNE	Provides the interface to tune SQL statements.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_STAT_FUNCS	Provides statistical functions.
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects.
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations.
DBMS_STREAMS	Describes the interface to convert SYS.AnyData objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.
DBMS_STREAMS_ADMIN	Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level.
DBMS_STREAMS_AUTH	Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators.
DBMS_STREAMS_MESSAGING	Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue.
DBMS_STREAMS_TABLESPACE_ADM	Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing.
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities.
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing.
DBMS_TDB	Reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TTS	Checks if the transportable set is self-contained.
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types.
DBMS_UTILITY	Provides various utility routines.
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings.
DBMS_WORKLOAD_REPOSITORY	lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions.
DBMS_XDB	Describes Resource Management and Access Control APIs for PL/SQL
DBMS_XDB_VERSION	Describes versioning APIs
DBMS_XDBT	Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format.
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents.
DMBS_XMLQUERY	Provides database-to-XMLType functionality.
DBMS_XMLSAVE	Provides XML-to-database-type functionality.
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas.
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables.
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command.
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents.
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process.
HTF	Hypertext functions generate HTML tags.
HTMLDB_APPLICATION	Enables users to take advantage of global variables
HTMLDB_CUSTOM_AUTH	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.
HTMLDB_ITEM	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.
HTMLDB_UTIL	Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.
HTP	Hypertext procedures generate HTML tags.
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL web applications.
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser.
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image.
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates.
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string.
OWA_SEC	Provides an interface for custom authentication.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.
SDO_CS	Provides functions for coordinate system transformation.
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.
SDO_GEOM	Provides functions implementing geometric operations on spatial objects.
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata.
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.
SDO_LRS	Provides functions for linear referencing system support.
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases.
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network.
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_SAM	Contains functions and procedures for spatial analysis and data mining.
SDO_TOPO	Provides procedures for creating and managing Spatial topologies.
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object).
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial.
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial.
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update.
UTL_COMPRESS	Provides a set of data compression utilities.
UTL_DBWS	Provides database web services.
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts.
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges.
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications.
UTL_INADDR	Provides a procedure to support internet addressing.
UTL_LMS	Retrieves and formats error messages in different languages.
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt.
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs
UTL_RAW	Provides SQL functions for RAW datatypes that concat, substr to and from RAWS.
UTL_RECOMP	Recompiles invalid PL/SQL modules, Java classes, indextypes and operators in a database, either sequentially or in parallel.
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object.
UTL_SMTP	Provides PL/SQL functionality to send emails.
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world.
UTL_URL	Provides escape and unescape mechanisms for URL characters.
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Streams AQ Types	Describes the types used in Advanced Queuing
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
LOGICAL CHANGE RECORD TYPES	Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams
interMedia ORDAudio Type	Supports the storage and management of audio data.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
`interMedia ORDDoc Type`	Supports the storage and management of heterogeneous media data including image, audio, and video.
`interMedia ORDImage Type`	Supports the storage, management, and manipulation of image data.
`interMedia ORDImageSignature Type`	Supports content-based retrieval of images (image matching).
`interMedia SQL/MM Still Image Type`	Provides support for the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates.
`interMedia ORDVideo Type`	Supports the storage and management of video data.
`RULES TYPES`	Describes the types used with rules, rule sets, and evaluation contexts
`XMLType`	Describes the types and functions used for native XML support in the server.

2

CTX_ADM

This Oracle Text package lets you administer servers and the data dictionary. Note that you must install this package in order to use it.

Documentation of CTX_ADM

For a complete description of this package within the context of Oracle Text, see `CTX_ADM` in the *Oracle Text Reference*.

3

CTX_CLS

This Oracle Text package enables generation of CTXRULE rules for a set of documents.

- Documentation of CTX_CLS

Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see `CTX_CLS` in the *Oracle Text Reference*.

4

CTX_DDL

This Oracle Text package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

Documentation of CTX_DDL

For complete description of this package within the context of Oracle Text, see `CTX_DDL` in the *Oracle Text Reference.*

5

CTX_DOC

This Oracle Text package lets you request document services. Note that you must install this package in order to use it.

Documentation of CTX_DOC

For a complete description of this package within the context of Oracle Text, see `CTX_DOC` in the *Oracle Text Reference*.

6

CTX_OUTPUT

This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see `CTX_OUTPUT` in the *Oracle Text Reference*.

7

CTX_QUERY

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see `CTX_QUERY` in the *Oracle Text Reference*.

8

CTX_REPORT

This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

Documentation of CTX_REPORT

For a complete description of this package within the context of Oracle Text, see `CTX_REPORT` in the *Oracle Text Reference*.

9

CTX_THES

This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see `CTX_THES` in the *Oracle Text Reference*.

10

CTX_ULEXER

This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see `CTX_ULEXER` in the *Oracle Text Reference.*

11

DBMS_ADVANCED_REWRITE

DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the `DBMS_ADVANCED_REWRITE` package.

Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

Summary of DBMS_ADVANCED_REWRITE Subprograms

This table list the all the package subprograms in alphabetical order.

Table 11–1 DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
ALTER_REWRITE_EQUIVALENCE Procedure on page 11-5	Changes the mode of the rewrite equivalence declaration to the mode you specify
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure on page 11-6	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
DECLARE_REWRITE_EQUIVALENCE Procedures on page 11-7	Creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance
DROP_REWRITE_EQUIVALENCE Procedure on page 11-9	Drops the specified rewrite equivalence declaration
VALIDATE_REWRITE_EQUIVALENCE Procedure on page 11-10	Validates the specified rewrite equivalence declaration using the same validation method as described with the `validate` parameter

ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
   name        VARCHAR2,
   mode        VARCHAR2);
```

Parameters

Table 11–2 ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration to alter. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.
mode	The following modes are supported, in increasing order of power: disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle Corporation recommends you use the least powerful mode that is sufficient to solve your performance problem.

BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure. It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          VARCHAR2,
   destination_stmt     VARCHAR2,
   validate             BOOLEAN    := TRUE,
   mode                 VARCHAR2   := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          CLOB,
   destination_stmt     CLOB,
   validate             BOOLEAN   := TRUE,
   mode                 VARCHAR2  := 'TEXT_MATCH');
```

Parameters

Table 11–3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.
source_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.
destination_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format.
validate	A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two sub-SELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.

Table 11–3 (Cont.) DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
mode	The following modes are supported, in increasing order of power: ■ disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. ■ text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. ■ general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. ■ recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.

DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (
   name         VARCHAR2);
```

Parameters

Table 11–4 DROP_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to drop. The name can be of the form `owner.name`, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the `VALIDATE` parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure" on page 11-10.

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
   name         VARCHAR2);
```

Parameters

Table 11–5 VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the `source_stmt` and `destination_stmt` of the specified equivalence declaration.

12

DBMS_ADVISOR

DBMS_ADVISOR is part of the Server Manageability suite of Advisors, a set of expert systems that identifies and helps resolve performance problems relating to the various database server components.

See Also:

- *Oracle Database Administrator's Guide* for information regarding the Segment Advisor
- *Oracle Database Performance Tuning Guide* for information regarding the SQL Tuning Advisor and SQL Access Advisor
- *Oracle Database 2 Day DBA* and *Oracle Database Administrator's Guide* for information regarding the Undo Advisor

This chapter contains the following topics:

Using DBMS_ADVISOR

This section contains topics which relate to using the `DBMS_ADVISOR` package.

Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. EXECUTE privilege on this cover package can then be granted rather than on this package. In addition, there is an ADVISOR privilege, which is required by DBMS_ADVISOR procedures.

Summary of DBMS_ADVISOR Subprograms

Table 12–1 DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
ADD_SQLWKLD_REF Procedure on page 12-6	Adds a workload reference to an Advisor task	SQL Access Advisor only
ADD_SQLWKLD_ STATEMENT Procedure on page 12-7	Adds a single statement to a workload	SQL Access Advisor only
CANCEL_TASK Procedure on page 12-9	Cancels a currently executing task operation	All Advisors
CREATE_FILE Procedure on page 12-10	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	All Advisors
CREATE_OBJECT Procedure on page 12-11	Creates a new task object	All Advisors
CREATE_SQLWKLD Procedure on page 12-13	Creates a new workload object	SQL Access Advisor only
CREATE_TASK Procedures on page 12-14	Creates a new Advisor task in the repository	All Advisors
DELETE_SQLWKLD Procedure on page 12-16	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_ REF Procedure on page 12-17	Deletes an entire workload object	SQL Access Advisor only
DELETE_SQLWKLD_ STATEMENT Procedure on page 12-18	Deletes one or more statements from a workload	SQL Access Advisor only
DELETE_TASK Procedure on page 12-19	Deletes the specified task from the repository	All Advisors
EXECUTE_TASK Procedure on page 12-20	Executes the specified task	All Advisors
GET_REC_ATTRIBUTES Procedure on page 12-21	Retrieves specific recommendation attributes from a task	All Advisors
GET_TASK_REPORT Function on page 12-22	Creates and returns a report for the specified task	All Advisors
GET_TASK_SCRIPT Function on page 12-23	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	All Advisors
IMPLEMENT_TASK Procedure on page 12-25	Implements the tuning recommendations for a task	All Advisors
IMPORT_SQLWKLD_ SCHEMA Procedure on page 12-26	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_ SQLCACHE Procedure on page 12-28	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_ STS Procedure on page 12-30	Imports data into a workload from a SQL Tuning Set into a SQL workload data object	SQL Access Advisor only

Table 12–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
IMPORT_SQLWKLD_SUMADV Procedure on page 12-32	Imports data into a workload from the current SQL cache	SQL Access Advisor only
IMPORT_SQLWKLD_USER Procedure on page 12-34	Imports data into a workload from the current SQL cache	SQL Access Advisor only
INTERRUPT_TASK Procedure on page 12-36	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	All Advisors
MARK_RECOMMENDATION Procedure on page 12-37	Sets the `annotation_status` for a particular recommendation	All Advisors
QUICK_TUNE Procedure on page 12-38	Performs an analysis on a single SQL statement	All Advisors
RESET_TASK Procedure on page 12-40	Resets a task to its initial state	All Advisors
SET_DEFAULT_SQLWKLD_PARAMETER Procedure on page 12-41	Imports data into a workload from schema evidence	SQL Access Advisor only
SET_DEFAULT_TASK_PARAMETER Procedures on page 12-42	Modifies a default task parameter	All Advisors
SET_SQLWKLD_PARAMETER Procedure on page 12-43	Sets the value of a workload parameter	SQL Access Advisor only
SET_TASK_PARAMETER Procedure on page 12-49	Sets the specified task parameter value	All Advisors
TUNE_MVIEW Procedure on page 12-60	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor only
UPDATE_OBJECT Procedure on page 12-62	Updates a task object	All Advisors
UPDATE_REC_ATTRIBUTES Procedure on page 12-64	Updates an existing recommendation for the specified task	All Advisors
UPDATE_SQLWKLD_ATTRIBUTES Procedure on page 12-66	Updates a workload object	SQL Access Advisor only
UPDATE_SQLWKLD_STATEMENT Procedure on page 12-67	Updates one or more SQL statements in a workload	SQL Access Advisor only
UPDATE_TASK_ATTRIBUTES Procedure on page 12-69	Updates a task's attributes	All Advisors

ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2);
```

Parameters

Table 12–2 ADD_SQLWKLD_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure DELETE_REFERENCE.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
END;
/
```

ADD_SQLWKLD_STATEMENT Procedure

This procedure adds a single statement to the specified workload.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
   workload_name          IN VARCHAR2,
   module                 IN VARCHAR2,
   action                 IN VARCHAR2,
   cpu_time               IN NUMBER := 0,
   elapsed_time           IN NUMBER := 0,
   disk_reads             IN NUMBER := 0,
   buffer_gets            IN NUMBER := 0,
   rows_processed         IN NUMBER := 0,
   optimizer_cost         IN NUMBER := 0,
   executions             IN NUMBER := 1,
   priority               IN NUMBER := 2,
   last_execution_date    IN DATE := 'SYSDATE',
   stat_period            IN NUMBER := 0,
   username               IN VARCHAR2,
   sql_text               IN CLOB);
```

Parameters

Table 12–3 ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The optimizer's calculated cost value.
executions	The total execution count by the SQL statement. This value should be greater than zero.
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
last_execution_date	The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.
stat_period	Time interval in seconds from which statement statistics were calculated.

Table 12–3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
username	The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-40 for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. cpu_time, elapsed_time, disk_reads, buffer_gets, and optimizer_cost are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the order_list task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter order_list. The order_list parameter accepts any combination of the keys: buffer_gets, optimizer_cost, cpu_time, disk_reads, elapsed_time, executions, and priority. A typical setting of priority, optimizer_cost would indicate the SQL Access Advisor will sort the workload data by priority and optimizer_cost and process the highest cost statements first. Any statements added to the workload would need to include appropriate priority and optimizer_cost values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the order_list task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
END;
/
```

CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as `Ctrl-C`. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
   task_name      IN  VARCHAR2);
```

Parameters

Table 12–4 CANCEL_TASK Procedure Parameter

Parameter	Description
`task_name`	A valid Advisor task name that uniquely identifies an existing task.

Usage Notes

A cancel command effective restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (
   buffer       IN  CLOB,
   location     IN  VARCHAR2,
   filename     IN  VARCHAR2);
```

Parameters

Table 12–5 CREATE_FILE Procedure Parameters

Parameter	Description
buffer	A CLOB buffer containing report or script information.
location	Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.
filename	Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
    'MY_DIR','script.sql');

END;
/
```

CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   object_id         OUT NUMBER);

DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   attr5             IN VARCHAR2 :=  NULL,
   object_id         OUT NUMBER);
```

Parameters

Table 12–6 CREATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or

LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
END;
/
```

CREATE_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
   workload_name            IN OUT VARCHAR2,
   description              IN VARCHAR2 := NULL,
   template                 IN VARCHAR2 := NULL,
   is_template              IN VARCHAR2 := 'FALSE');
```

Parameters

Table 12–7 CREATE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
description	Specifies an optional workload description. Descriptions can be up to 256 characters.
template	An optional SQL Workload name of an existing workload data object or data object template.
is_template	An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

Once a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_id               OUT NUMBER,
   task_name             IN OUT VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_name             IN VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);
```

Parameters

Table 12–8 CREATE_TASK Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.
task_name	Specifies a new task name. Names must be unique among all tasks for the user. When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`

  Parameters are preset to favor an OLTP application environment.

- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`

  Parameters are preset to favor a data warehouse application environment.

- `DBMS_ADVISOR.SQLACCESS_GENERAL`

  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

DELETE_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 12–9 DELETE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

DELETE_SQLWKLD_REF Procedure

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN NUMBER);
```

Parameters

Table 12–10 DELETE_SQLWKLD_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access task name that uniquely identifies an existing task.
workload_name	The name of the workload object to be unlinked. The wildcard % is supported as a workload_name. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the workload_name.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

DELETE_SQLWKLD_STATEMENT Procedure

This procedure deletes one or more statements from a workload.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   sql_id               IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   search               IN VARCHAR2,
   deleted              OUT NUMBER);
```

Parameters

Table 12–11 DELETE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 12–12 DELETE_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be deleted from the repository. The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 12–13 EXECUTE_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
   workload_name         IN VARCHAR2,
   rec_id                IN NUMBER,
   action_id             IN NUMBER,
   attribute_name        IN VARCHAR2,
   value                 OUT VARCHAR2,
   owner_name            IN VARCHAR2 := NULL);
```

Parameters

Table 12–14 GET_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```

GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (
   task_name      IN VARCHAR2,
   type           IN VARCHAR2 := 'TEXT',
   level          IN VARCHAR2 := 'TYPICAL',
   section        IN VARCHAR2 := 'ALL',
   owner_name     IN VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 12–15 GET_TASK_REPORT Function Parameters

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.

Return Values

Returns the buffer receiving the script.

GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
   task_name          IN VARCHAR2
   type               IN VARCHAR2 := 'IMPLEMENTATION',
   rec_id             IN NUMBER := NULL,
   act_id             IN NUMBER := NULL,
   owner_name         IN VARCHAR2 := NULL)
RETURN CLOB;
```

Parameters

Table 12–16 GET_TASK_SCRIPT Function Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
type	Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.
rec_id	An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
act_id	Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
owner_name	Optional task owner name.

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
```

```
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

IMPLEMENT_TASK Procedure

Implements the recommendations of the specified task.

Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (
   task_name          IN VARCHAR2,
   rec_id             IN NUMBER := NULL,
   exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 12–17 IMPLEMENT_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional boolean to exit on the first error.

IMPORT_SQLWKLD_SCHEMA Procedure

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 12–18 IMPORT_SQLWKLD_SCHEMA Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
failed_rows	Returns the number or rows that were not saved due to syntax or validation errors
saved_rows	Returns the number of rows actually saved in the repository.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle Corporation recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 12–19 IMPORT_SQLWKLD_SQLCACHE Procedure Parameters

Parameter	Description
workload_ name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ▪ APPEND Indicates that the collected workload will be added to any existing workload in the task. ▪ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ▪ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.
saved_rows	Returns the number of rows saved as output parameters.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
```

```
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_STS Procedure

This procedure loads a SQL workload from an existing SQL Tuning Set. A SQL Tuning Set is typically created from the server workload repository using various time and data filters.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_owner             IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 12–20 IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sts_owner	The optional owner of the SQL Tuning Set.
sts_name	The name of an existing SQL Tuning Set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
     saved, failed);
END;
/
```

IMPORT_SQLWKLD_SUMADV Procedure

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9*i* Database Summary Advisor users in the migration to SQL Access Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   sumadv_id             IN NUMBER,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 12–21 IMPORT_SQLWKLD_SUMADV Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
sumadv_id	Specifies the Summary Advisor workload identifier number.
saved_rows	Returns the number of rows actually saved in the repository.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/
```

IMPORT_SQLWKLD_USER Procedure

This procedure collects a SQL workload from a specified user table.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   owner_name             IN VARCHAR2,
   table_name             IN VARCHAR2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 12–22 IMPORT_SQLWKLD_USER Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
owner_name	Specifies the owner name of the table or view from which workload data will be collected.
table_name	Specifies the name of the table or view from which workload data will be collected.
saved_rows	Returns the number of rows actually saved in the workload object.
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
```

```
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 12–23 INTERRUPT_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
  DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
   task_name          IN VARCHAR2
   id                 IN NUMBER,
   action             IN VARCHAR2);
```

Parameters

Table 12–24 MARK_RECOMMENDATION Procedure Parameters

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.
action	The recommendation action setting. The possible actions are: ■ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts. ■ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script. ■ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/
```

QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
   advisor_name           IN VARCHAR2,
   task_name              IN VARCHAR2,
   attr1                  IN CLOB,
   attr2                  IN VARCHAR2 := NULL,
   attr3                  IN NUMBER := NULL,
   task_or_template       IN VARCHAR2 := NULL);
```

Parameters

Table 12–25 QUICK_TUNE Procedure Parameters

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
task_or_template	An optional task name of an existing task or task template.

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```
DECLARE
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
                  'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

RESET_SQLWKLD Procedure

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 12–26 RESET_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

RESET_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to `INITIAL`.

Syntax

```
DBMS_ADVISOR.RESET_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 12–27 RESET_TASK Procedure Parameters

Parameter	Description
`task_name`	The task name that uniquely identifies an existing task.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  DBMS_ADVISOR.RESET_TASK(task_name);
END;
/
```

SET_DEFAULT_SQLWKLD_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 12–28 SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
parameter	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
value	The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```

SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 12–29 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
   'VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_SQLWKLD_PARAMETER Procedure

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 12–30 SET_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
`workload_name`	The SQL Workload object name that uniquely identifies an existing workload.
`parameter`	The name of the data parameter to be modified. Parameter names are not case sensitive.
`value`	The value of the specified parameter. The value can be specified as a string or a number. If the value is `DBMS_ADVISOR.DEFAULT`, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

SQL Workload Object Parameters

Table 12–31 lists SQL Access Advisor object parameters.

Table 12–31 SQL Workload Object Parameters

Name	Datatype	Description
ACTION_LIST	STRINGLIST	Use VALID_ACTION_LIST instead. Contains a fully qualified list of actions that are eligible for saving in a workload. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a workload import operation, if a SQL statements action does not match a name in the action list, it will not be stored in the workload object. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
COMMENTED_ FILTER_LIST	NUMBER	Use INVALID_SQLSTRING_LIST instead. Comma-delimited list of strings. When set, SQL Access Advisor will filter out any SQL statement that contain any of the specified strings in the first 20 characters of its text.
DAYS_TO_EXPIRE	NUMBER	Specifies the expiration time in days for the current SQL Workload object. The value is relative to the last modification date. Once the data expires, it will become a candidate for removal by an automatic purge operation. The possible values are: ■ an integer in the range of 0 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is 30.
END_TIME	STRING	Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second
INVALID_ ACTION_LIST	STRINGLIST	Contains a fully qualified list of actions that are not eligible for saving in a workload. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During workload collection, if a SQL statement's action matches a name in the action list, it will not be processed by the operation. An action name is case sensitive. Possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
INVALID_MODULE_LIST	STRINGLIST	Contains a fully qualified list of application modules that are not eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During workload collection, if a SQL statement's module matches a name in the list, it will not be processed by the operation. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
INVALID_SQLSTRING_LIST		Contains a fully qualified list of text strings that are not eligible when populating a SQL workload object. The list of elements is comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During workload collection, if a SQL statement contains a string in the SQL string list, it will not be processed by the operation. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
INVALID_TABLE_LIST	TABLELIST	Contains a fully qualified list of tables that are not eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for both schemas and tables. The default value is all tables within the users scope are eligible for tuning. The supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted if any referenced table matches an entry in the invalid table list. The valid syntax for a table reference is: ■ schema.table ■ schema ■ schema.% (equivalent to schema) The possible values are: ■ single table reference ■ comma-delimited table reference list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. Note that SQL Access Advisor maintains an internal list of non-tunable tables regardless of the contents of the INVALID_TABLE_LIST parameter. No table that is owned by SYS, SYSTEM or any other pre-defined Oracle schema can be tuned.
INVALID_USERNAME_LIST	STRINGLIST	Contains a fully qualified list of usernames that are not eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During workload collection, if a SQL statements' username matches a name in the username list, it will not be processed by the operation. A username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
JOURNALING	NUMBER	Controls the logging of messages to the journal (USER_ADVISOR_JOURNAL view). The higher the setting, the more information is logged to the journal. The valid settings are: ■ 0: no journal messages ■ 1: fatal error messages ■ 2: simple error messages ■ 3: non-fatal warning messages ■ 4-9: information messages (4 is the default)
MODULE_LIST	STRINGLIST	Use VALID_MODULE_LIST instead. Contains a fully qualified list of application modules that are eligible for saving in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a workload import operation, if a SQL statements application module does not match a name in the module list, it will not be stored in the workload object. The possible values are: ■ single module ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
ORDER_LIST	STRING	Contains the primary natural order in which the SQL Access Advisor processes workload elements during the import operation. Possible values are: BUFFER_GETS, OPTIMIZER_COST, CPU_TIME, DISK_READS, ELAPSED_TIME, EXECUTIONS, and PRIORITY.
REPORT_DATE_ FORMAT		This parameter is not used.
SQL_LIMIT	NUMBER	Specifies the maximum number of SQL statements to be saved during a workload import operation. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_ LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, Access Advisor will process and save the most interesting SQL statements by ordering the statements according to the specified sort keys. The possible values are: ■ an integer in the range of 1 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
START_TIME	STRING	Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
USERNAME_LIST	STRINGLIST	Use VALID_USERNAME_LIST instead. Contains a fully qualified list of usernames that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported. During a workload import operation, if a SQL statements username does not match a name in the username list, it will not be stored in the workload object. A Username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
VALID_ACTION_LIST	STRINGLIST	Contains a fully qualified list of actions that are eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During workload collection, if a SQL statement's action does not match a name in the action list, it will not be processed by the operation. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
VALID_MODULE_LIST	STRINGLIST	Contains a fully qualified list of application modules that are eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During workload collection, if a SQL statement's module does not match a name in the module list, it will not be processed by the operation. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–31 (Cont.) SQL Workload Object Parameters

Name	Datatype	Description
VALID_ SQLSTRING_LIST	STRINGLIST	Contains a fully qualified list of text strings that are eligible when populating a SQL workload object. The list elements are comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During workload collection, if a SQL statement does not contain a string in the SQL string list, it will not be processed by the operation. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
VALID_TABLE_ LIST	TABLELIST	Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. The supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. When using the IMPORT_SQLWKLD_SCHEMA procedure, the valid_table_list parameter cannot contain wildcards such as SCO% or SCOTT.EMP%. The only form of wildcards supported is SCOTT.%, which specifies all tables in a given schema. The valid syntax for a table reference is: ■ schema.table ■ schema ■ schema.% (equivalent to schema) The possible values are: ■ single table reference ■ comma-delimited table reference list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
VALID_ USERNAME_LIST	STRINGLIST	Contains a fully qualified list of usernames that are eligible when populating a SQL workload object. The list of elements is comma-delimited, and quoted names are supported. During workload collection, if a SQL statement's username does not match a name in the username list, it will not be processed by the operation. A username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;
/
```

SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 12–32 SET_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.

Usage Notes

A task cannot be modified unless it is in its initial state. See "RESET_TASK Procedure" on page 12-40 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 12–33 lists SQL Access Advisor task parameters.

Table 12–33 SQL Access Advisor Task Parameters

Parameter	Datatype	Description
ACTION_LIST	STRINGLIST	Use VALID_ACTION_LIST instead. Contains a fully qualified list of actions that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
COMMENTED_ FILTER_LIST	NUMBER	Use INVALID_SQLSTRING_LIST instead. Comma-delimited list of strings. When set, the SQL Access Advisor will filter out any SQL statement that contain any of the specified strings in the first 20 characters of its text.
CREATION_COST	STRING	When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to false, the cost of creation is ignored.
DAYS_TO_ EXPIRE	NUMBER	Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. Once the task expires, it becomes a candidate for removal by an automatic purge operation. The possible values are: ■ an integer in the range of 0 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is 30.
DEF_INDEX_ OWNER	STRING	Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
DEF_INDEX_ TABLESPACE	STRING	Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED No tablespace clause will be present in the script for indexes. The default value is ADVISOR_UNUSED.
DEF_MVIEW_ OWNER	STRING	Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
DEF_MVIEW_ TABLESPACE	STRING	Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED.
DEF_MVLOG_ TABLSPACE	STRING	Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED.
DML_ VOLATILITY	STRING	When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, it may favor a Btree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. See the related parameter refresh_mode.
END_TIME	STRING	Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second
EVALUATION_ ONLY	STRING	If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated. Possible values are: ■ FALSE ■ TRUE The default value is FALSE.
EXECUTION_ TYPE	STRINGLIST	The type of recommendations that is desired. Possible values: ■ FULL All supported recommendation types will be considered. ■ INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations. ■ MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations. ■ MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations. The default value is FULL.

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
IMPLEMENT_ EXIT_ON_ERROR	STRING	When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error. The possible values are: ■ TRUE ■ FALSE The default value is TRUE.
INDEX_NAME_ TEMPLATE	STRING	Specifies the method by which new index names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ID* in the template. Once formatted, the maximum size of a name is 30 characters. Valid keywords are: ■ Any literal value up to 22 characters. ■ TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit. ■ TASK_ID Causes the current task identifier number to be inserted in hexadecimal form. ■ SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is <TABLE>_IDX$$_<TASK_ID><SEQ>.
INVALID_ ACTION_LIST	STRINGLIST	Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
INVALID_ MODULE_LIST	STRINGLIST	Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
INVALID_ SQLSTRING_ LIST	STRINGLIST	Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
INVALID_ USERNAME_LIST	STRINGLIST	Contains a fully qualified list of usernames that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's username matches a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
JOURNALING	NUMBER	Controls the logging of messages to the journal (USER_ADVISOR_JOURNAL view). The higher the setting, the more information is logged to the journal. Valid settings are: ■ 0: no journal messages ■ 1: fatal error messages ■ 2: simple error messages ■ 3: non-fatal warning messages ■ 4-9: information messages (4 is the default)
MODE	STRING	Specifies the mode by which Access Advisor will operate during an analysis. Valid values are: ■ LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality. ■ COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality. The default value is COMPREHENSIVE.
MODULE_LIST	STRINGLIST	Use VALID_MODULE_LIST instead. Contains a fully qualified list of application modules that are eligible for processing in a SQL Workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a workload import operation, if a SQL statement's application module does not match a name in the module list, it will not be stored in the workload object. Possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
MVIEW_NAME_ TEMPLATE	STRING	Specifies the method by which new materialized view names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ID* in the template. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: ■ Any literal value up to 22 characters. ■ *TASK_ID* Causes the current task identifier number to be inserted in hexadecimal form. ■ *SEQ* Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is: MV$$_<TASK_ID><SEQ>.
ORDER_LIST	STRINGLIST	Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_LIST values. A comma must separate multiple order keys. Possible values are: ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's CPU time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's execution frequency value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ I/O Sets the order using the SQL statement's I/O count value. ■ PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST.
RECOMMEND_MV_ EXACT_TEXT_ MATCH	STRING	When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE. The possible values are: ■ TRUE ■ FALSE The default value is TRUE.
REFRESH_MODE	STRING	Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_ volatility is set to TRUE. Possible values are: ■ ON_DEMAND ■ ON_COMMIT The default value is ON_DEMAND.
REPORT_DATE_ FORMAT	STRING	This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI.
SHOW_RETAINS	STRING	Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are: ■ TRUE ■ FALSE The default value is TRUE.

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
SQL_LIMIT	NUMBER	Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. The possible values are: ■ an integer in the range of 1 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
START_TIME	STRING	Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second
STORAGE_ CHANGE	NUMBER	Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL. When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand. Possible values: ■ Any valid integer including negative values, zero and positive values. The default value is ADVISOR_UNLIMITED.
USERNAME_LIST	STRINGLIST	Use VALID_USERNAME_LIST instead. Contains a fully qualified list of usernames that are eligible for processing in a workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. Possible values: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
VALID_ACTION_LIST	STRINGLIST	Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
VALID_MODULE_LIST	STRINGLIST	Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
VALID_SQLSTRING_LIST	STRINGLIST	Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.

Table 12–33 (Cont.) SQL Access Advisor Task Parameters

Parameter	Datatype	Description
VALID_TABLE_LIST	TABLELIST	Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is: ■ schema.table ■ schema ■ schema.% (equivalent to schema) ■ comma-delimited action list ■ ADVISOR_UNUSED The possible values are: ■ single table reference ■ comma-delimited reference list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
VALID_USERNAME_LIST	STRINGLIST	Contains a fully qualified list of usernames that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED.
WORKLOAD_SCOPE	STRING	Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL. FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables. PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables.

Segment Advisor Parameters

Table 12–35 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 12–34 Segment Advisor Task Parameters

Parameter	Default Value	Possible Values	Description
MODE	COMPREHENSIVE	LIMITED: Analysis restricted to statistics available in Automatic Workload Repository. COMPREHENSIVE: Comprehensive analysis based on sampling and Automatic Workload Repository statistics.	The data to use for analysis.
TIME_LIST	UNLIMITED	UNLIMITED	The time limit for which the Advisor should run. Specified in seconds.
RECOMMEND_ALL	TRUE	If set to TRUE, generate recommendations on all segments specified by the user. If set to FALSE, recommendations for only those objects that are eligible for shrink.	Whether to generate recommendations for all segments.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

   DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
   DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
      'SH.%,SCOTT.EMP');
END;
/
```

Undo Advisor Task Parameters

Table 12–35 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

Table 12–35 Undo Advisor Task Parameters

Parameter	Default Value	Possible Values	Description
TARGET_OBJECTS	none	UNDO_TBS	The target object is the undo tablespace of the system.
START_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository.
END_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	none	Any positive integer.	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC.
END_TIME_SEC	none	Any positive integer.	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC.

Examples

```
DECLARE
   tname  VARCHAR2(30);
   oid    NUMBER;
   BEGIN
     DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
     DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
     DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
     DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
     DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
     DBMS_ADVISOR.EXECUTE_TASK(tname);
   END;
/
```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 12–36 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure.

Table 12–36 ADDM Task Parameters

Parameter	Default	Possible Values	Description
START_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository.
END_SNAPSHOT	none	The valid snapshot numbers in the AWR repository.	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository.
DB_ID	The current database ID.	Not applicable.	The database for START_SNAPSHOT and END_SNAPSHOT.
INSTANCE	The current instance ID.	Not applicable.	The instance for START_SNAPSHOT and END_SNAPSHOT.
DBIO_EXPECTED	10 milliseconds	System dependent.	The average time to read the database block in microseconds.

Examples

```
DECLARE
   tid     NUMBER;
BEGIN
   DBMS_ADVISOR.CREATE_TASK('ADDM', tid, 'ADDM_TEST', 'my test');
   DBMS_ADVISOR.SET_TASK_PARAMETER('ADDM_TEST', 'START_SNAPSHOT', '19',
                                                -  'END_SNAPSHOT',   '26',
                                                -  'DB_ID', '155789304',
                                                -  'INSTANCE', '1');
   DBMS_ADVISOR.EXECUTE_TASK('ADDM_TEST');
END;
/
```

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package on page 101-1 and *Oracle Database Performance Tuning Guide* for more information.

TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
   task_name IN OUT VARCHAR2,
   mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

Table 12–37 TUNE_MVIEW Procedure Parameters

Parameter	Description
task_name	The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.
mv_create_stmt	The original materialized view creation statement.

See Also: *Oracle Database Performance Tuning Guide* for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

Table 12–38 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

Column Name	Column Description
OWNER	The materialized view owner's name.
TASK_NAME	The task name as a key to access the set of recommendations
SCRIPT_TYPE	Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: ■ CREATE MATERIALIZED VIEW LOG ■ ALTER MATERIALIZED VIEW LOG FORCE ■ [CREATE | DROP] MATERIALIZED VIEW

Examples

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS  ''/myscript_dir'' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_
task'), -
'/homes/tune','my_tune_mview_create.sql');
```

The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.

UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
   task_name       IN VARCHAR2
   object_id       IN NUMBER,
   attr1           IN VARCHAR2 := NULL,
   attr2           IN VARCHAR2 := NULL,
   attr3           IN VARCHAR2 := NULL,
   attr4           IN CLOB := NULL,
   attr5           IN VARCHAR2 := NULL);
```

Parameters

Table 12–39 UPDATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
```

```
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL,
                              'SELECT count(*) FROM SH.SALES');
END;
/
```

UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
   task_name            IN VARCHAR2
   rec_id               IN NUMBER,
   action_id            IN NUMBER,
   attribute_name       IN VARCHAR2,
   value                IN VARCHAR2);
```

Parameters

Table 12–40 UPDATE_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
`task_name`	The task name that uniquely identifies an existing task.
`rec_id`	The Advisor-generated identifier number that is assigned to the recommendation.
`action_id`	The Advisor-generated action identifier that is assigned to the particular command.
`attribute_name`	Name of the attribute to be changed. The valid values are: ■ `owner` The new owner of the object. ■ `name` The new name of the object. ■ `tablespace` The new tablespace for the object.
`value`	Specifies the new value for the recommendation attribute.

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

attribute := 'SH';
```

```
  DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/
```

UPDATE_SQLWKLD_ATTRIBUTES Procedure

This procedure changes various attributes of a SQL Workload object or template.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
   workload_name        IN VARCHAR2,
   new_name             IN VARCHAR2 := NULL,
   description          IN VARCHAR2 := NULL,
   read_only            IN VARCHAR2 := NULL,
   is_template          IN VARCHAR2 := NULL,
   how_created          IN VARCHAR2 := NULL);
```

Parameters

Table 12–41 UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

UPDATE_SQLWKLD_STATEMENT Procedure

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   sql_id            IN NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   search            IN VARCHAR2,
   updated           OUT NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);
```

Parameters

Table 12–42 UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
username	The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
search	Disabled.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 12-40 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
   task_name          IN VARCHAR2
   new_name           IN VARCHAR2 := NULL,
   description        IN VARCHAR2 := NULL,
   read_only          IN VARCHAR2 := NULL,
   is_template        IN VARCHAR2 := NULL,
   how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 12–43 UPDATE_TASK_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');
END;
/
```

13

DBMS_ALERT

DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

Using DBMS_ALERT

Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (`WAITONE`) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (`SIGNAL`) whenever the trigger is fired.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package.

Constants

The DBMS_ALERT package uses the constants shown in Table 13–1:

Table 13–1 DBMS_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 13–2 shows the messages and the procedures that can raise them.

Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

  See Also: Chapter 70, "DBMS_PIPE"

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
  - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

Table 13–2 DBMS_ALERT Error Messages

Error Message	Procedure
`ORU-10001 lock request error, status: N`	`SIGNAL`
`ORU-10015 error: N waiting for pipe status`	`WAITANY`
`ORU-10016 error: N sending on pipe 'X'`	`SIGNAL`
`ORU-10017 error: N receiving on pipe 'X'`	`SIGNAL`
`ORU-10019 error: N on lock request`	`WAIT`
`ORU-10020 error: N on lock request`	`WAITANY`

Table 13–2 (Cont.) DBMS_ALERT Error Messages

Error Message	Procedure
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
    <<readagain>>:
   /* ... read the emp table and graph it */
      DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
      if status = 0 then goto <<readagain>>; else
      /* ... error condition */
```

The EMP table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
    BEGIN
      DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
   END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

Summary of DBMS_ALERT Subprograms

Table 13–3 DBMS_ALERT Package Subprograms

Subprogram	Description
REGISTER Procedure on page 13-12	Receives messages from an alert
REMOVE Procedure on page 13-13	Disables notification from an alert
REMOVEALL Procedure on page 13-14	Removes all alerts for this session from the registration list
SET_DEFAULTS Procedure on page 13-15	Sets the polling interval
SIGNAL Procedure on page 13-16	Signals an alert (send message to registered sessions)
WAITANY Procedure on page 13-17	Waits `timeout` seconds to receive alert message from an alert registered for session
WAITONE Procedure on page 13-18	Waits `timeout` seconds to receive message from named alert

REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (
   name  IN  VARCHAR2);
```

Parameters

Table 13–4 REGISTER Procedure Parameters

Parameter	Description
name	Name of the alert in which this session is interested.

Caution: Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (
   name  IN  VARCHAR2);
```

Parameters

Table 13–5 REMOVE Procedure Parameters

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```

SET_DEFAULTS Procedure

In case a polling loop is required, use the SET_DEFAULTS procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (
   sensitivity  IN  NUMBER);
```

Parameters

Table 13–6 SET_DEFAULTS Procedure Parameters

Parameter	Description
sensitivity	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (
   name     IN  VARCHAR2,
   message  IN  VARCHAR2);
```

Parameters

Table 13–7 SIGNAL Procedure Parameters

Parameter	Description
`name`	Name of the alert to signal.
`message`	Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (
   name      OUT  VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 13–8 WAITANY Procedure Parameters

Parameter	Description
name	Returns the name of the alert that occurred.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If no alert occurs before timeout seconds, this returns a status of 1.

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

```
-20000, ORU-10024: there are no alerts registered.
```

WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
   name      IN   VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 13–9 WAITONE Procedure Parameters

Parameter	Description
name	Name of the alert to wait for.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If the named alert does not occurs before timeout seconds, this returns a status of 1.

14

DBMS_APPLICATION_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

Using DBMS_APPLICATION_INFO

Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the `V$SESSION` and `V$SQLAREA` views.

Security Model

> **Note:** The public synonym for `DBMS_APPLICATION_INFO` is not dropped before creation so that you can redirect the public synonym to point to your own package.

No further privileges are required. The `DBMSAPIN.SQL` script is already run by `catproc`.

Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the `SYS` version of the package. The public synonym for `DBMS_APPLICATION_INFO` can then be changed to point to the DBA's version of the package.

Summary of DBMS_APPLICATION_INFO Subprograms

Table 14–1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
READ_CLIENT_INFO Procedure on page 14-7	Reads the value of the `client_info` field of the current session
READ_MODULE Procedure on page 14-8	Reads the values of the module and action fields of the current session
SET_ACTION Procedure on page 14-9	Sets the name of the current action within the current module
SET_CLIENT_INFO Procedure on page 14-10	Sets the `client_info` field of the session
SET_MODULE Procedure on page 14-11	Sets the name of the module that is currently running to a new module
SET_SESSION_LONGOPS Procedure on page 14-12	Sets a row in the `V$SESSION_LONGOPS` table

READ_CLIENT_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (
   client_info OUT VARCHAR2);
```

Parameters

Table 14–2 READ_CLIENT_INFO Procedure Parameters

Parameter	Description
`client_info`	Last client information value supplied to the `SET_CLIENT_INFO` procedure.

READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
   module_name OUT VARCHAR2,
   action_name OUT VARCHAR2);
```

Parameters

Table 14–3 READ_MODULE Procedure Parameters

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ----------------- ----------------
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
   action_name IN VARCHAR2);
```

Parameters

Table 14–4 SET_ACTION Procedure Parameters

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

   DBMS_APPLICATION_INFO.SET_ACTION(
      action_name => 'transfer from chk to sav');
   UPDATE chk SET bal = bal + :amt
      WHERE acct# = :acct;
   UPDATE sav SET bal = bal - :amt
      WHERE acct# = :acct;
   COMMIT;
   DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
   client_info IN VARCHAR2);
```

Parameters

Table 14–5 SET_CLIENT_INFO Procedure Parameters

Parameter	Description
`client_info`	Supplies any additional information about the client application. This information is stored in the `V$SESSION` view. Information exceeding 64 bytes is truncated.

Note: `CLIENT_INFO` is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
   module_name IN VARCHAR2,
   action_name IN VARCHAR2);
```

Parameters

Table 14–6 SET_MODULE Procedure Parameters

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

SET_SESSION_LONGOPS Procedure

This procedure sets a row in the V$SESSION_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the SET_SESSION_LONGOPS procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the V$SESSION_LONGOPS view.

Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
   rindex      IN OUT BINARY_INTEGER,
   slno        IN OUT BINARY_INTEGER,
   op_name     IN     VARCHAR2       DEFAULT NULL,
   target      IN     BINARY_INTEGER DEFAULT 0,
   context     IN     BINARY_INTEGER DEFAULT 0,
   sofar       IN     NUMBER         DEFAULT 0,
   totalwork   IN     NUMBER         DEFAULT 0,
   target_desc IN     VARCHAR2       DEFAULT 'unknown target',
   units       IN     VARCHAR2       DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

Parameters

Table 14–7 SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
rindex	A token which represents the v$session_longops row to update. Set this to set_session_longops_nohint to start a new row. Use the returned value from the prior call to reuse a row.
slno	Saves information across calls to set_session_longops: It is for internal use and should not be modified by the caller.
op_name	Specifies the name of the long running task. It appears as the OPNAME column of v$session_longops. The maximum length is 64 bytes.
target	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of v$session_longops.
context	Any number the client wants to store. It appears in the CONTEXT column of v$session_longops.
sofar	Any number the client wants to store. It appears in the SOFAR column of v$session_longops. This is typically the amount of work which has been done so far.
totalwork	Any number the client wants to store. It appears in the TOTALWORK column of v$session_longops. This is typically an estimate of the total amount of work needed to be done in this long running operation.

Table 14–7 (Cont.) SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the target parameter. This value appears in the TARGET_DESC field of v$session_longops. The maximum length is 32 bytes.
units	Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```
DECLARE
        rindex    BINARY_INTEGER;
        slno      BINARY_INTEGER;
        totalwork number;
        sofar     number;
        obj       BINARY_INTEGER;

      BEGIN
        rindex := dbms_application_info.set_session_longops_nohint;
        sofar := 0;
        totalwork := 10;

        WHILE sofar < 10 LOOP
          -- update obj based on sofar
          -- perform task on object target

          sofar := sofar + 1;
          dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
        END LOOP;
      END;
```

15

DBMS_APPLY_ADM

The DBMS_APPLY_ADM package, one of a set of Streams packages, provides subprograms to start, stop, and configure an apply process. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and apply processes

This chapter contains the following topic:

Summary of DBMS_APPLY_ADM Subprograms

Table 15–1 DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
ALTER_APPLY Procedure on page 15-4	Alters an apply process
COMPARE_OLD_VALUES Procedure on page 15-9	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
CREATE_APPLY Procedure on page 15-11	Creates an apply process
CREATE_OBJECT_DEPENDENCY Procedure on page 15-18	Creates an object dependency
DELETE_ALL_ERRORS Procedure on page 15-19	Deletes all the error transactions for the specified apply process
DELETE_ERROR Procedure on page 15-20	Deletes the specified error transaction
DROP_APPLY Procedure on page 15-21	Drops an apply process
DROP_OBJECT_DEPENDENCY on page 15-22	Drops an object dependency
EXECUTE_ALL_ERRORS Procedure on page 15-23	Reexecutes the error transactions for the specified apply process.
EXECUTE_ERROR Procedure on page 15-24	Reexecutes the specified error transaction
GET_ERROR_MESSAGE Function on page 15-27	Returns the message payload from the error queue for the specified message number and transaction identifier
SET_DML_HANDLER Procedure on page 15-28	Alters operation options for a specified object with a specified apply process
SET_ENQUEUE_DESTINATION Procedure on page 15-33	Sets the queue where the apply process automatically enqueues a message that satisfies the specified rule
SET_EXECUTE Procedure on page 15-35	Specifies whether a message that satisfies the specified rule is executed by an apply process
SET_GLOBAL_INSTANTIATION_SCN Procedure on page 15-37	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
SET_KEY_COLUMNS Procedures on page 15-39	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
SET_PARAMETER Procedure on page 15-41	Sets an apply parameter to the specified value
SET_SCHEMA_INSTANTIATION_SCN Procedure on page 15-46	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database

Table 15–1 (Cont.) DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
SET_TABLE_INSTANTIATION_SCN Procedure on page 15-48	Records the specified instantiation SCN for the specified table in the specified source database
SET_UPDATE_CONFLICT_HANDLER Procedure on page 15-50	Adds, updates, or drops an update conflict handler for the specified object
SET_VALUE_DEPENDENCY Procedure on page 15-53	Sets or removes a value dependency
START_APPLY Procedure on page 15-54	Directs the apply process to start applying messages
STOP_APPLY Procedure on page 15-55	Stops the apply process from applying any messages and rolls back any unfinished transactions being applied

Note: All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.

ALTER_APPLY Procedure

This procedure alters an apply process.

Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY(
   apply_name                IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   message_handler           IN  VARCHAR2  DEFAULT NULL
   remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
   ddl_handler               IN  VARCHAR2  DEFAULT NULL,
   remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
   apply_user                IN  VARCHAR2  DEFAULT NULL,
   apply_tag                 IN  RAW       DEFAULT NULL,
   remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler         IN  VARCHAR2  DEFAULT NULL,
   remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–2 ALTER_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being altered. You must specify an existing apply process name. Do not specify an owner.
rule_set_name	The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages. If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set.

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified apply process. If you remove the positive rule set for an apply process, and the apply process does not have a negative rule set, then the apply process dequeues all messages in its queue. If you remove the positive rule set for an apply process, and a negative rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified apply process. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply process. See "Usage Notes" on page 15-16 in the CREATE_APPLY Procedure for more information about a message handler procedure.
remove_message_handler	If TRUE, then the procedure removes the message handler for the specified apply process. If FALSE, then the procedure retains any message handler for the specified apply process. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.
ddl_handler	A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply process. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 15-16 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.
remove_ddl_handler	If TRUE, then the procedure removes the DDL handler for the specified apply process. If FALSE, then the procedure retains any DDL handler for the specified apply process. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
apply_user	The user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. If NULL, then the apply user is not changed. If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted DBA role. Only the SYS user can set the apply_user to SYS. If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process These privileges must be granted directly to the apply user. They cannot be granted through roles. By default, this parameter is set to the user who created the apply process by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the apply_user for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.
apply_tag	A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter. If NULL, the default, then the apply tag for the apply process is not changed. The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_apply_tag	If TRUE, then the procedure sets the apply tag for the specified apply process to NULL, and the apply process generates redo entries with NULL tags. If FALSE, then the procedure retains any apply tag for the specified apply process. If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process. An internal commit directive is enqueued in the following ways: ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user-enqueued message, the commit SCN is generated by the apply process. The precommit handler procedure must conform to the following restrictions: ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 15-16 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.
remove_precommit_handler	If TRUE, then the procedure removes the precommit handler for the specified apply process. If FALSE, then the procedure retains any precommit handler for the specified apply process. If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 15–2 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages. If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified apply process. If you remove the negative rule set for an apply process, and the apply process does not have a positive rule set, then the apply process dequeues all messages in its queue. If you remove the negative rule set for an apply process, and a positive rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified apply process. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

An apply process is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- message_handler
- ddl_handler
- apply_user
- apply_tag
- precommit_handler

COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply. This procedure is relevant only for `UPDATE` and `DELETE` operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about conflict detection and resolution in a Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_list         IN VARCHAR2,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_table        IN DBMS_UTILITY.LNAME_ARRAY,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 15–3 COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
`object_name`	The name of the source table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`column_list`	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify `*` to include all nonkey columns.
`column_table`	A PL/SQL index-by table of type `DBMS_UTILITY.LNAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.
`operation`	The name of the operation, which can be specified as: ■ `UPDATE` for `UPDATE` operations ■ `DELETE` for `DELETE` operations ■ `*` for both `UPDATE` and `DELETE` operations
`compare`	If `compare` is `TRUE`, the old values of the specified columns are compared during apply. If `compare` is `FALSE`, the old values of the specified columns are not compared during apply.

Table 15–3 (Cont.) COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

By default, an apply process uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you use a time column for conflict detection, then an apply process does not need to check old values for non-key and nontime columns.

Note: An apply process always compares old values for key columns when they are present in a row LCR. This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

CREATE_APPLY Procedure

This procedure creates an apply process.

> **Note:** The user who invokes this procedure must be granted `DBA` role.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
   queue_name              IN  VARCHAR2,
   apply_name              IN  VARCHAR2,
   rule_set_name           IN  VARCHAR2  DEFAULT NULL,
   message_handler         IN  VARCHAR2  DEFAULT NULL,
   ddl_handler             IN  VARCHAR2  DEFAULT NULL,
   apply_user              IN  VARCHAR2  DEFAULT NULL,
   apply_database_link     IN  VARCHAR2  DEFAULT NULL,
   apply_tag               IN  RAW       DEFAULT '00',
   apply_captured          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler       IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–4 CREATE_APPLY Procedure Parameters

Parameter	Description
`queue_name`	The name of the queue from which the apply process dequeues messages. You must specify an existing queue in the form `[`*`schema_name`*`.]`*`queue_name`*. For example, to specify a queue in the `hr` schema named `streams_queue`, enter `hr.streams_queue`. If the schema is not specified, then the current user is the default. **Note:** The `queue_name` setting cannot be altered after the apply process is created.
`apply_name`	The name of the apply process being created. A `NULL` specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply process or messaging client. **Note:** The `apply_name` setting cannot be altered after the apply process is created.

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages. If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply process applies either all captured messages or all user-enqueued messages in the queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply process. See "Usage Notes" on page 15-16 for more information about a message handler procedure.
ddl_handler	A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply process. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 15-16 for more information about a DDL handler procedure.

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_user	The user who applies all DML and DDL changes that satisfy the apply process rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used. Only a user who is granted DBA role can set an apply user. Only the SYS user can set the apply_user to SYS. The apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process These privileges must be granted directly to the apply user. They cannot be granted through roles. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the apply_user setting for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.
apply_database_link	The database at which the apply process applies messages. This parameter is used by an apply process when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply process applies messages at the local database. **Note:** The apply_database_link setting cannot be altered after the apply process is created.

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_tag	A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter. By default, the tag for an apply process is the hexadecimal equivalent of '00' (double zero). The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') If NULL, then the apply process generates redo entries with NULL tags. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
apply_captured	Either TRUE or FALSE. If TRUE, then the apply process applies only the messages in a queue that were captured by a Streams capture process. If FALSE, then the apply process applies only the user-enqueued messages in a queue. These messages are user messages that were not captured by a Streams capture process. These messages might or might not contain a user-created LCR. To apply both captured and user-enqueued messages in a queue, you must create at least two apply processes. **Note:** The apply_captured setting cannot be altered after the apply process is created. See Also: *Oracle Streams Concepts and Administration* for more information about processing captured or user-enqueued messages with an apply process

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process. An internal commit directive is enqueued in the following ways: ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user-enqueued message, the commit SCN is generated by the apply process. The precommit handler procedure must conform to the following restrictions: ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 15-16 for more information about a precommit handler procedure.
negative_rule_set_name	The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages. If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the apply process applies either all captured messages or all user-enqueued messages in the queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.

Table 15–4 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
source_database	The global name of the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. If NULL, then the source database name of the first LCR received by the apply process is used for the source database. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. The rules in the apply process rule sets determine which messages are dequeued by the apply process. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.

Usage Notes

The following sections describe usage notes for this procedure:

Handler Procedure Names

For the message_handler, ddl_handler, and precommit_handler parameters, specify an existing procedure in one of the following forms:

- *[schema_name.]procedure_name*
- *[schema_name.]package_name.procedure_name*

If the procedure is in a package, then the package_name must be specified. For example, to specify a procedure in the apply_pkg package in the hr schema named process_ddls, enter hr.apply_pkg.process_ddls. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified handler procedure. Also, if the *schema_name* is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

Message Handler and DDL Handler Procedure

The procedure specified in both the message_handler parameter and the ddl_handler parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a ANYDATA encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a ANYDATA encapsulation of a DDL LCR.

See Also: Chapter 188, "Logical Change Record TYPEs" for information about DDL LCRs

Precommit Handler Procedure

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name   IN  NUMBER);
```

Here, *`handler_procedure`* stands for the name of the procedure and *`parameter_name`* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply process schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply process uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply process does not use column values in the LCRs to detect dependencies.

Note: An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- "DROP_OBJECT_DEPENDENCY" on page 15-22
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 15–5 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply process.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
   apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

Table 15–6 DELETE_ALL_ERRORS Procedure Parameter

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are deleted.

DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(
   local_transaction_id  IN  VARCHAR2);
```

Parameter

Table 15–7 DELETE_ERROR Procedure Parameter

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

DROP_APPLY Procedure

This procedure drops an apply process.

Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
   apply_name             IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 15–8 DROP_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being dropped. You must specify an existing apply process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply process if these rule sets are not used by any other Streams client. Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop an apply process, information about rules created for the apply process using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply process. The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

> **See Also:** *Oracle Streams Concepts and Administration* for more information about Streams data dictionary views

DROP_OBJECT_DEPENDENCY

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- "CREATE_OBJECT_DEPENDENCY Procedure" on page 15-18
- *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 15–9 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply process.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
   apply_name       IN  VARCHAR2  DEFAULT NULL,
   execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–10 EXECUTE_ALL_ERRORS Procedure Parameters

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are reexecuted.
execute_as_user	If TRUE, then the procedure reexecutes the transactions in the security context of the current user. If FALSE, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.

EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
   local_transaction_id  IN  VARCHAR2,
   execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
   user_procedure        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–11 EXECUTE_ERROR Procedure Parameters

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
`execute_as_user`	If `TRUE`, then the procedure reexecutes the transaction in the security context of the current user. If `FALSE`, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The `DBA_APPLY_ERROR` data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.
`user_procedure`	A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify `NULL` to execute the error transaction without running a user procedure. **See Also:** "Usage Notes" on page 15-24 for more information about the user procedure

Usage Notes

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[`*`schema_name`*`.]`*`package_name.procedure_name`*
- `[`*`schema_name`*`.]`*`procedure_name`*

If the procedure is in a package, then the *`package_name`* must be specified. The user who invokes the `EXECUTE_ERROR` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the *`schema_name`* is not specified, then the user who invokes the `EXECUTE_ERROR` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `strmadmin` is the *`schema_name`*.

- fix_errors is the *package_name*.
- fix_hr_errors is the *procedure_name*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     in_anydata                    IN      ANYDATA,
     error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,
     error_message_number          IN      NUMBER,
     messaging_default_processing  IN OUT  BOOLEAN,
     out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- in_anydata: The ANYDATA encapsulation of a message that the apply process passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- error_record: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction
- error_message_number: The message number of the ANYDATA object in the in_anydata parameter, starting at 1
- messaging_default_processing: If TRUE, then the apply process continues processing the message in the in_anydata parameter, which can include executing DML or DDL statements and invoking apply handlers.

  If FALSE, then the apply process skips processing the message in the in_anydata parameter and moves on to the next message in the in_anydata parameter.
- out_anydata: The ANYDATA object processed by the user procedure and used by the apply process if messaging_default_processing is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the messaging_default_processing parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in_anydata parameter is a row LCR, then the out_anydata parameter must be row LCR if the messaging_default_processing parameter is set to TRUE.

- If the ANYDATA object in the in_anydata parameter is a DDL LCR, then the out_anydata parameter must be DDL LCR if the messaging_default_processing parameter is set to TRUE.
- The user who runs the user procedure must have SELECT privilege on the DBA_APPLY_ERROR data dictionary view.

Note: LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two `OUT` parameters. These `OUT` parameters contain the destination queue into which the message should be enqueued, if one exists, and whether or not the message should be executed. The destination queue is specified using the `SET_ENQUEUE_DESTINATION` procedure, and the execution directive is specified using the `SET_EXECUTE` procedure.

See Also:

- "SET_ENQUEUE_DESTINATION Procedure" on page 15-33
- "SET_EXECUTE Procedure" on page 15-35

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2,
   destination_queue_name  OUT  VARCHAR2,
   execute                 OUT  BOOLEAN)
RETURN ANYDATA;

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 15–12 GET_ERROR_MESSAGE Function Parameters

Parameter	Description
`message_number`	The identification number of the message. This number identifies the position of the message in the transaction. Query the `DBA_APPLY_ERROR` data dictionary view to view the message number of each apply error.
`local_transaction_id`	Identifier of the error transaction for which to return a message
`destination_queue_name`	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains `NULL`.
`execute`	Contains `TRUE` if the message should be executed Contains `FALSE` if the message should not be executed

SET_DML_HANDLER Procedure

This procedure sets a user procedure as a DML handler for a specified operation on a specified object. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER(
   object_name          IN  VARCHAR2,
   object_type          IN  VARCHAR2,
   operation_name       IN  VARCHAR2,
   error_handler        IN  BOOLEAN   DEFAULT FALSE,
   user_procedure       IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL,
   apply_name           IN  VARCHAR2  DEFAULT NULL,
   assemble_lobs        IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–13 SET_DML_HANDLER Procedure Parameters

Parameter	Description
object_name	The name of the source object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
object_type	The type of the source object. Currently, TABLE is the only possible source object type.
operation_name	The name of the operation, which can be specified as: ■ INSERT ■ UPDATE ■ DELETE ■ LOB_UPDATE For example, suppose you run this procedure twice for the hr.employees table. In one call, you set operation_name to UPDATE and user_procedure to employees_update. In another call, you set operation_name to INSERT and user_procedure to employees_insert. Both times, you set error_handler to FALSE. In this case, the employees_update procedure is run for UPDATE operations on the hr.employees table, and the employees_insert procedure is run for INSERT operations on the hr.employees table.
error_handler	If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply process error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.

Table 15–13 (Cont.) SET_DML_HANDLER Procedure Parameters

Parameter	Description
user_procedure	A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when the apply process encounters an error. Specify NULL to unset a DML handler that is set for the specified operation on the specified object.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
apply_name	The name of the apply process that uses the DML handler or error handler. If NULL, then the procedure sets the DML handler or error handler as a general handler for all apply processes in the database. If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply process, then use the apply_name parameter to specify the apply process to unset the handler.
assemble_lobs	If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly. If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.

Usage Notes

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply process error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a DML handler, not an error handler, and a DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a DML handler or an error handler for a particular operation on an object. It cannot set both a DML handler and an error handler for the same object and operation.

If the apply_name parameter is non-NULL, then the DML handler or error handler is set for the specified apply process. In this case, this handler is not invoked for other apply processes at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply processes at the destination database. When a handler is set for a specific apply process, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A DML handler named handler_hr is specified for an apply process named apply_hr for UPDATE operations on the hr.employees table.
- A general DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.

In this case, the apply_hr apply process uses the handler_hr DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Attention: Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with DML handlers, error handlers, or custom rule-based transformation functions. DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

Note: Currently, setting an error handler for an apply process that is applying changes to a non-Oracle database is not supported.

The SET_DML_HANDLER procedure can be used to set either a DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [*schema_name*.]*package_name*.*procedure_name*
- [*schema_name*.]*procedure_name*

If the procedure is in a package, then the *package_name* must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the specified procedure. Also, if the *schema_name* is not specified, then the user who invokes the SET_DML_HANDLER procedure is the default.

For example, suppose the procedure_name has the following properties:

- hr is the *schema_name*.
- apply_pkg is the *package_name*.
- employees_default is the *procedure_name*.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.

- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

See Also: *Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding DML handlers and LOB, LONG, and LONG RAW datatypes

Signature of a DML Handler Procedure

The procedure specified in the user_procedure parameter must have the following signature:

```
PROCEDURE user_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *user_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

See Also: Chapter 188, "Logical Change Record TYPEs" for more information about LCRs

Signature of an Error Handler Procedure

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     message            IN  ANYDATA,
     error_stack_depth  IN  NUMBER,
     error_numbers      IN  DBMS_UTILITY.NUMBER_ARRAY,
     error_messages     IN  emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use error_numbers(1) and error_messages(1).

Note:

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
- The emsg_array value must be a user-defined array that is a table of type VARCHAR2 with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply process.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply process automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is a Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_ENQUEUE.
- The value is a ANYDATA instance containing the queue name specified as a VARCHAR2.

Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
  rule_name               IN  VARCHAR2,
  destination_queue_name  IN  VARCHAR2);
```

Parameters

Table 15–14 SET_ENQUEUE_DESTINATION Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue into which the apply process should enqueue the message. Specify the queue in the form [*schema_name.*]*queue_name*. Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. If NULL, then an existing name-value pair with the name APPLY$_ENQUEUE is removed. If no name-value pair exists with the name APPLY$_ENQUEUE for the rule, then no action is taken. If non-NULL and a name-value pair already exists for the rule with the name APPLY$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added.

Usage Notes

If an apply handler, such as a DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply process tries to enqueue a message into it.
- Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply processes using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply process. If the rule is in the negative rule set for an apply process, then the apply process does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply process rule sets.

SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply process.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is a Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_EXECUTE.
- The value is a ANYDATA instance that contains NO as a VARCHAR2. When the value is NO, then an apply process does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
  rule_name  IN  VARCHAR2,
  execute    IN  BOOLEAN);
```

Parameters

Table 15–15 SET_EXECUTE Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
execute	If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply process executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply process does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair already exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.

Usage Notes

If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.

Note:

- Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply process for the apply process to follow the execution directive. If the rule is in the negative rule set for an apply process, then the apply process ignores the execution directive for the rule.

SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–16 SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, `and base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Note:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

- *Oracle Streams Replication Administrator's Guide*

SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_list          IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_table         IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–17 SET_KEY_COLUMNS Procedure Parameters

Parameter	Description
`object_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If the apply process is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
`column_list`	A comma-delimited list of the columns in the table that you want to use as the substitute primary key, with no spaces between the column names. If the `column_list` parameter is empty or `NULL`, then the current set of key columns is removed.
`column_table`	A PL/SQL index-by table of type `DBMS_UTILITY.NAME_ARRAY` of the columns in the table that you want to use as the substitute primary key. The index for `column_table` must be 1-based, increasing, dense, and terminated by a `NULL`. If the `column_table` parameter is empty or `NULL`, then the current set of key columns is removed.
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

When not empty, this set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object already has primary key columns and you want to use those primary key columns as the key.

Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.

Note:

- Unlike true primary keys, columns specified as substitute key column columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- You should not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all non LOB, non LONG, and non LONG RAW columns.

SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
   apply_name  IN  VARCHAR2,
   parameter   IN  VARCHAR2,
   value       IN  VARCHAR2);
```

Parameters

Table 15–18 SET_PARAMETER Procedure Parameters

Parameter	Description
apply_name	The apply process name. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Apply Process Parameters" on page 15-41 for a list of these parameters.
value	The value to which the parameter is set

Apply Process Parameters

The following table lists the parameters for the apply process.

Table 15–19 Apply Process Parameters

Parameter Name	Possible Values	Default	Description
allow_duplicate_rows	Y or N	N	If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply process only updates or deletes one of the rows. If N, then the apply process raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. **Note:** Regardless of the setting for this parameter, apply processes do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. **See Also:** "Duplicate Rows and Substitute Primary Key Columns" on page 15-44
commit_serialization	full or none	full	The order in which applied transactions are committed. If full, then the apply process commits applied transactions in the order in which they were committed at the source database. If none, then the apply process can commit transactions in any order. Performance is best if you specify none. Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies. Logical standby environments typically specify full.
disable_on_error	Y or N	Y	If Y, then the apply process is disabled on the first unresolved error, even if the error is not fatal. If N, then the apply process continues regardless of unresolved errors.

Table 15–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the apply process is disabled if the apply process terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply process is restarted immediately after stopping because it reached a limit.
maximum_scn	A valid SCN or infinite	infinite	The apply process is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If infinite, then the apply process runs regardless of the SCN value.
parallelism	A positive integer	1	The number of transactions that can be concurrently applied. Setting the parallelism parameter to a number higher than the number of available parallel execution servers can disable the apply process. Make sure the PROCESSES and PARALLEL_MAX_SERVERS initialization parameters are set appropriately when you set the parallelism apply process parameter. **Note:** When the value of this parameter is changed for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.
startup_seconds	0, a positive integer, or infinite	0	The maximum number of seconds to wait for another instantiation of the same apply process to finish. If the other instantiation of the same apply process does not finish within this time, then the apply process does not start. If infinite, then an apply process does not start until another instantiation of the same apply process finishes.
time_limit	A positive integer or infinite	infinite	The apply process stops as soon as possible after the specified number of seconds since it started. If infinite, then the apply process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
transaction_limit	A positive integer or infinite	infinite	The apply process stops after applying the specified number of transactions. If infinite, then the apply process continues to run regardless of the number of transactions applied.

Table 15–19 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
txn_lcr_spill_threshold	A positive integer or infinite	10000	The apply process begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply process has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way: 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory The apply process applies the first 10,100 messages from the hard disk and the last 100 messages from memory. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply process is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages. If infinite, then the apply process does not spill messages to the hard disk. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply process. **Note:** When the value of this parameter is changed for a running apply process, the new setting does not take effect until the apply process is restarted.
write_alert_log	Y or N	Y	If Y, then the apply process writes a message to the alert log on exit. If N, then the apply process does not write a message to the alert log on exit. The message specifies the reason why the apply process stopped.

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is `4,294,967,295`. Where applicable, specify `infinite` for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when the all of the column values are identical for two or more rows in the table, excluding LOB, `LONG`, and `LONG RAW` columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that updates at the source database always update at least one of the columns specified as a substitute key column at the destination database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

If a table does not have a primary key, a unique index that has at least one `NOT NULL` column, or a substitute key, then the key consists of all non LOB, non `LONG`, and non `LONG RAW` columns. When there is no key for a table and the `allow_duplicate_rows` apply process parameter is set to `Y`, a single row LCR with an `UPDATE` or `DELETE` command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can

update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply process ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply process determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, `LONG`, and `LONG RAW` columns). Therefore, an apply process always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply process does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply process raises an error regardless of the setting for the `allow_duplicate_rows` apply process parameter.

See Also: "SET_KEY_COLUMNS Procedures" on page 15-39

SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–20 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_schema_name	The name of the source schema. For example, hr.
source_database_name	The global name of the source database. For example, DBS1.NET.
	If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user.
	If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables
	Note: If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a `command_type` of `CREATE TABLE`
- DDL LCRs with a non-`NULL` `object_owner` specified and neither `base_table_owner` nor `base_table_name` specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a `command_type` of `CREATE TABLE` and `ALTER USER`.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a `command_type` of `CREATE USER`. A global instantiation SCN is needed for such DDL LCRs.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

Note: Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

- *Oracle Streams Replication Administrator's Guide*

SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
  source_object_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–21 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_object_name	The name of the source object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.

Usage Notes

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply process at the destination database disregards the LCR. Otherwise, the apply process applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a command_type of ALTER TABLE or CREATE TRIGGER.

Note: The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
   object_name          IN  VARCHAR2,
   method_name          IN  VARCHAR2,
   resolution_column    IN  VARCHAR2,
   column_list          IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 15–22 SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
object_name	The schema and name of the table, specified as [*schema_name.*]*object_name*, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.
method_name	Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained: ■ MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. ■ MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. ■ OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database. ■ DISCARD: Retains the column list from the destination database, discarding the column list from the source database. If NULL, then the procedure removes any existing update conflict handler with the same object_name, resolution_column, and column_list. If non-NULL, then the procedure replaces any existing update conflict handler with the same object_name and resolution_column.

Table 15–22 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
resolution_column	Name of the column used to uniquely identify an update conflict handler. For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the column_list parameter. NULL is not allowed for this parameter. For the OVERWRITE and DISCARD prebuilt methods, you can specify any column in the column list.
column_list	List of columns for which the conflict handler is called. If a conflict occurs for one or more of the columns in the list when an apply process tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. **Note:** Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, and user-defined type columns. Therefore, you should not include these types of columns in the column_list parameter.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. **Note:** Currently, conflict handlers are not supported when applying changes to a non-Oracle database.

Usage Notes

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

If you want to remove an existing update conflict handler, then specify NULL for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply process, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the SET_DML_HANDLER procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

Note: Currently, setting an update conflict handler for an apply process that is applying to a non-Oracle database is not supported.

See Also:

- "Signature of an Error Handler Procedure" on page 15-31 for information about setting an error handler
- "SET_DML_HANDLER Procedure" on page 15-28
- *Oracle Streams Replication Administrator's Guide* for more information about prebuilt and custom update conflict handlers

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name           =>  'hr.employees',
    method_name           =>  'MAXIMUM',
    resolution_column     =>  'salary',
    column_list           =>  cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply process uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 15–23 SET_VALUE_DEPENDENCY Procedure Parameters

Parameter	Description
`dependency_name`	The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If `NULL`, an error is raised.
`object_name`	The name of the table, specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If `NULL` and the specified dependency exists, then the dependency is removed. If `NULL` and the specified dependency does not exist, then an error is raised. If `NULL`, then `attribute_list` and `attribute_table` also must be `NULL`.
`attribute_list`	A comma-delimited list of column names in the table. There must be no spaces between entries.
`attribute_table`	A PL/SQL index-by table of type `DBMS_UTILITY.NAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.

START_APPLY Procedure

This procedure directs the apply process to start applying messages.

Syntax

```
DBMS_APPLY_ADM.START_APPLY(
   apply_name  IN  VARCHAR2);
```

Parameter

Table 15–24 START_APPLY Procedure Parameter

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is ENABLED, then the apply process is started upon database instance startup. An apply process (a*nnn*) is an Oracle background process. The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of an apply process.

STOP_APPLY Procedure

This procedure stops the apply process from applying messages and rolls back any unfinished transactions being applied.

Syntax

```
DBMS_APPLY_ADM.STOP_APPLY(
   apply_name  IN  VARCHAR2,
   force       IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 15–25 STOP_APPLY Procedure Parameters

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the apply process as soon as possible. If FALSE, then the procedure stops the apply process after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply process depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply process parameter. See "Usage Notes" for more information.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply process.

The following table describes apply process behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply process parameter. In all cases, the apply process rolls back any unfinished transactions when it stops.

force	commit_serialization	Apply Process Behavior
TRUE	full	The apply process stops immediately and does not apply any unfinished transactions.
TRUE	none	When the apply process stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	full	The apply process stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	none	Before stopping, the apply process applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the commit_serialization apply process parameter is set to none and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply process has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transaction 2 is not applied, and the apply process stops (transaction 2 is rolled back). If, however, the force parameter is set to FALSE, then transaction 2 is applied before the apply process stops.

A different scenario would result if the commit_serialization apply process parameter is set to full. For example, assume that the commit_serialization apply process parameter is set to full and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply process has applied transaction A and is in the process of applying transactions B and C when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transactions B and C are not applied, and the apply process stops (transactions B and C are rolled back). If, however, the force parameter is set to FALSE, then transaction B is applied before the apply process stops, and transaction C is rolled back.

See Also: "SET_PARAMETER Procedure" on page 15-41 for more information about the commit_serialization apply process parameter

DBMS_AQ

The DBMS_AQ package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:

- *Oracle Streams Advanced Queuing User's Guide and Reference*
- Oracle Streams AQ TYPEs for information about TYPEs to use with DBMS_AQ.

This chapter contains the following topics:

Using DBMS_AQ

Constants

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE. Table 16–1 lists the PL/SQL enumerated constants that require the prefix, DBMS_AQ.

Table 16–1 Enumerated Constants

Parameter	Options
visibility	IMMEDIATE, ON_COMMIT
dequeue mode	BROWSE, LOCKED, REMOVE, REMOVE_NODATA
navigation	FIRST_MESSAGE, NEXT_MESSAGE, NEXT_TRANSACTION
state	WAITING, READY, PROCESSED, EXPIRED
sequence_deviation	BEFORE, TOP . Note: The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).
wait	FOREVER, NO_WAIT
delay	NO_DELAY
expiration	NEVER
namespace	NAMESPACE_AQ, NAMESPACE_ANONYMOUS

Data Structures

Table 16–2 DBMS_AQ Data Structures

Data Structures	Description
Object Name on page 16-4	Names database objects
Type Name on page 16-4	Defines queue types
Oracle Streams AQ PL/SQL Callback on page 16-5	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The `type_name` data structure defines queue types.

Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

Attributes

Table 16–3 Type Name Attributes

Attribute	Description
object_type	Maximum number of attributes in the object type is limited to 900.

Table 16–3 (Cont.) Type Name Attributes

Attribute	Description
"RAW"	To store payload of type RAW, Oracle Streams AQ creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Streams AQ. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases. Because LOB columns are used for storing RAW payload, the Oracle Streams AQ administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the storage_clause parameter during queue table creation time.

Oracle Streams AQ PL/SQL Callback

The plsqlcallback data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN  RAW,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR,
  payload  IN  RAW,
  payloadl IN  NUMBER);
```

Attributes

Table 16–4 Oracle Streams AQ PL/SQL Callback Attributes

Attribute	Description
context	Specifies the context for the callback function that was passed by dbms_aq.register. See AQ$_REG_INFO Type on page 184-11.
reginfo	See AQ$_REG_INFO Type on page 184-11.
descr	See AQ$_DESCRIPTOR Type on page 184-5
payload	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
payloadl	Specifies the length of payload. If payload is null, payload1 = 0.

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN RAW,
  reginfo  IN SYS.AQ$_REG_INFO,
  descr    IN SYS.AQ$_DESCRIPTOR,
```

```
payload  IN VARCHAR2,
payloadl IN NUMBER);
```

Operational Notes

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for `DBMS_AQ` and `DBMS_AQADM`. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have `EXECUTE` privileges on the `DBMS_AQIN` package to use these interfaces.

Summary of DBMS_AQ Subprograms

Table 16–5 DBMS_AQ Package Subprograms

Subprograms	Description
BIND_AGENT Procedure on page 16-9	Creates an entry for an Oracle Streams AQ agent in the LDAP directory
DEQUEUE Procedure on page 16-10	Dequeues a message from the specified queue
DEQUEUE_ARRAY Function on page 16-13	Dequeues an array of messages from the specified queue
ENQUEUE Procedure on page 16-15	Adds a message to the specified queue
ENQUEUE_ARRAY Function on page 16-17	Adds an array of messages to the specified queue
LISTEN Procedures on page 16-18	Listen to one or more queues on behalf of a list of agents
POST Procedure on page 16-20	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
REGISTER Procedure on page 16-21	Registers for message notifications
UNBIND_AGENT Procedure on page 16-22	Removes an entry for an Oracle Streams AQ agent from the LDAP directory
UNREGISTER Procedure on page 16-23	Unregisters a subscription which turns off notification

Note: `DBMS_AQ` does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have `RNDS`, `WNDS`, `RNPS` or `WNPS` constraints defined.

BIND_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

Syntax

```
DBMS_AQ.BIND_AGENT(
   agent        IN SYS.AQ$_AGENT,
   certificate  IN VARCHAR2 default NULL);
```

Parameters

Table 16–6 BIND_AGENT Procedure Parameters

Parameter	Description
`agent`	Agent that is to be registered in LDAP server.
`certificate`	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute `usercertificate`) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (
   queue_name           IN      VARCHAR2,
   dequeue_options      IN      dequeue_options_t,
   message_properties   OUT     message_properties_t,
   payload              OUT     "<ADT_1>"
   msgid                OUT     RAW);
```

Parameters

Table 16–7 DEQUEUE Procedure Parameters

Parameter	Description
`queue_name`	Specifies the name of the queue.
`dequeue_options`	See DEQUEUE_OPTIONS_T Type on page 184-15.
`message_properties`	See MESSAGE_PROPERTIES_T Type on page 184-22.
`payload`	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of *`type_name`* refer to Type Name on page 16-4.
`msgid`	System generated identification of the message.

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- `consumer_name`
- `msgid`

  `Msgid` uniquely identifies the message to be dequeued. Only messages in the `READY` state are dequeued unless `msgid` is specified.

- `correlation`

  Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.

- `deq_condition`

  Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

  To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

Note: It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See DEQUEUE_OPTIONS_T Type on page 184-15 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 17-22.
- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 17-35.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   dequeue_options           IN   dequeue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  OUT  message_properties_array_t,
   payload_array             OUT  "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 16–8 DEQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name from which messages are dequeued (same as single-row dequeue).
dequeue_options	The set of options which will be applied to all messages in the array (same as single-row dequeue).
array_size	The number of elements to dequeue.
message_properties_array	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 184-26.
payload_array	An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation.
msgid_array	An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 184-27.
error_array	Currently not implemented

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeue by message_id is not supported. See DEQUEUE Procedure on page 16-10 for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

See Also: ENQUEUE_OPTIONS_T Type on page 184-18

For transaction grouped queues and ONE_GROUP navigation, messages are dequeued from a single transaction group only, subject to the array_size limit. In MULTI_GROUP navigation, messages are dequeued across multiple transaction groups, still subject to the array_size limit. ORA-25235 is returned to indicate the end of a transaction group.

DEQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
   queue_name           IN      VARCHAR2,
   enqueue_options      IN      enqueue_options_t,
   message_properties   IN      message_properties_t,
   payload              IN       "<ADT_1>",
   msgid                OUT     RAW);
```

Parameters

Table 16–9 ENQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 184-18.
message_properties	See MESSAGE_PROPERTIES_T Type on page 184-22.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of *type_name* refer to Type Name on page 16-4.
msgid	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

Usage Notes

The sequence_deviation parameter in enqueue_options can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the enqueue_options parameter relative_msgid. The relationship is identified by the sequence_deviation parameter.

Specifying sequence_deviation for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

> **Note:** The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error ORA_24033 is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See MESSAGE_PROPERTIES_T Type on page 184-22 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 17-22.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 17-35.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   enqueue_options           IN   enqueue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  IN   message_properties_array_t,
   payload_array             IN   "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 16–10 ENQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 184-18.
array_size	The number of elements to enqueue.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 184-26.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, VARRAY, or nested table in its PL/SQL representation.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 184-27.
error_array	Currently not implemented

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
   agent_list            IN    AQ$_AGENT_LIST_T,
   wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
   agent                 OUT   SYS.AQ$_AGENT);

DBMS_AQ.LISTEN (
   agent_list             IN   AQ$_AGENT_LIST_T,
   wait                   IN   BINARY_INTEGER DEFAULT FOREVER,
   listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
   agent                  OUT  SYS.AQ$_AGENT,
   message_delivery_mode  OUT  PLS_INTEGER);

TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

Table 16–11 LISTEN Procedure Parameters

Parameter	Description
`agent_list`	List of agents to listen for
`wait`	Time out for the listen call in seconds. By default, the call will block forever.
`listen_delivery_mode`	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of `DBMS_AQ.PERSISTENT` or `DBMS_AQ.BUFFERED` or `DBMS_AQ.PERSISTENT_OR_BUFFERED`
`agent`	Agent with a message available for consumption
`message_delivery_mode`	Returns the message type along with the queue and consumer for which there is a message

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the LISTEN call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

Note: You cannot call LISTEN on nonpersistent queues.

POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (
  post_list       IN  SYS.AQ$_POST_INFO_LIST,
  post_count      IN  NUMBER);
```

Parameters

Table 16–12 POST Procedure Parameters

Parameter	Description
`post_list`	Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.
`post_count`	Specifies the number of entries in the `post_list`.

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   count        IN  NUMBER);
```

Parameters

Table 16–13 REGISTER Procedure Parameters

Parameter	Description
`reg_list`	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
`count`	Specifies the number of entries in the `reg_list`.

Usage Notes

This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.

If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

> **See Also:** Chapter 18, "DBMS_AQELM" for more information on e-mail and HTTP notifications

UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT(
   agent     IN SYS.AQ$_AGENT);
```

Parameters

Table 16–14 BIND_AGENT Procedure Parameters

Parameter	Description
agent	Agent that is to be removed from the LDAP server

UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   reg_count    IN  NUMBER);
```

Parameters

Table 16–15 UNREGISTER Procedure Parameters

Parameter	Description
`reg_list`	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
`reg_count`	Specifies the number of entries in the `reg_list`.

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

17

DBMS_AQADM

The DBMS_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

See Also:

- *Oracle Streams Advanced Queuing User's Guide and Reference*
- Chapter 184, "Oracle Streams AQ TYPEs" for information about the TYPEs to use with DBMS_AQADM

This chapter contains the following topics:

Using DBMS_AQADM

This section contains the following topics.

Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

Table 17–1 Enumerated Types in the Administrative Interface

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

Queue Table Subprograms

Table 17–2 Queue Table Subprograms

Subprograms	Description
ALTER_QUEUE_TABLE Procedure on page 17-20	Alters the existing properties of a queue table
CREATE_QUEUE_TABLE Procedure on page 17-26	Creates a queue table for messages of a predefined type
DROP_QUEUE_TABLE Procedure on page 17-34	Drops an existing queue table
ENABLE_JMS_TYPES Procedure on page 17-36	A precondition for the enqueue of JMS types and XML types
MIGRATE_QUEUE_TABLE Procedure on page 17-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 17-42	Purges messages from queue tables

Privilege Subprograms

Table 17–3 Privilege Subprograms

Subprograms	Description
GRANT_QUEUE_PRIVILEGE Procedure on page 17-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_ PRIVILEGE Procedure on page 17-40	Grants Oracle Streams AQ system privileges to users and roles
REVOKE_QUEUE_ PRIVILEGE Procedure on page 17-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_ PRIVILEGE Procedure on page 17-47	Revokes Oracle Streams AQ system privileges from users and roles

Queue Subprograms

Table 17–4 Queue Subprograms

Subprograms	Description
ALTER_QUEUE Procedure on page 17-19	Alters existing properties of a queue
CREATE_NP_QUEUE Procedure on page 17-23	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 17-24	Creates a queue in the specified queue table
DROP_QUEUE Procedure on page 17-33	Drops an existing queue
QUEUE_SUBSCRIBERS Function on page 17-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
START_QUEUE Procedure on page 17-51	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 17-52	Disables enqueuing or dequeuing on the specified queue

Subscriber Subprograms

Table 17–5 Subscriber Subprograms

Subprograms	Description
ADD_SUBSCRIBER Procedure on page 17-16	Adds a default subscriber to a queue
ALTER_SUBSCRIBER Procedure on page 17-21	Alters existing properties of a subscriber to a specified queue
REMOVE_SUBSCRIBER Procedure on page 17-45	Removes a default subscriber from a queue

Notification Subprograms

Table 17–6 Notification Subprograms

Subprograms	Description
GET_WATERMARK Procedure on page 17-38	Retrieves the value of watermark set by the `SET_WATERMARK Procedure`
SET_WATERMARK Procedure on page 17-50	Used for Oracle Streams AQ notification to specify and limit memory use

Propagation Subprograms

Table 17–7 Propagation Subprograms

Subprograms	Description
ALTER_PROPAGATION_SCHEDULE Procedure on page 17-18	Alters parameters for a propagation schedule
DISABLE_PROPAGATION_SCHEDULE Procedure on page 17-31	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure on page 17-37	Enables a previously disabled propagation schedule
SCHEDULE_PROPAGATION Procedure on page 17-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
UNSCHEDULE_PROPAGATION Procedure on page 17-53	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 17-54	Verifies that the source and destination queues have identical types

Oracle Streams AQ Agent Subprograms

Table 17–8 Oracle Streams AQ Agent Subprograms

Subprograms	Description
ALTER_AQ_AGENT Procedure on page 17-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
CREATE_AQ_AGENT Procedure on page 17-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
DISABLE_DB_ACCESS Procedure on page 17-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DROP_AQ_AGENT Procedure on page 17-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
ENABLE_DB_ACCESS Procedure on page 17-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user

Alias Subprograms

Table 17–9 Alias Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 17-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
DEL_ALIAS_FROM_LDAP Procedure on page 17-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

Summary of DBMS_AQADM Subprograms

Table 17–10 DBMS_AQADM Package Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 17-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
ADD_SUBSCRIBER Procedure on page 17-16	Adds a default subscriber to a queue
ALTER_AQ_AGENT Procedure on page 17-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
ALTER_PROPAGATION_SCHEDULE Procedure on page 17-18	Alters parameters for a propagation schedule
ALTER_QUEUE Procedure on page 17-19	Alters existing properties of a queue
ALTER_QUEUE_TABLE Procedure on page 17-20	Alters the existing properties of a queue table
ALTER_SUBSCRIBER Procedure on page 17-21	Alters existing properties of a subscriber to a specified queue
CREATE_AQ_AGENT Procedure on page 17-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
CREATE_NP_QUEUE Procedure on page 17-23	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 17-24	Creates a queue in the specified queue table
CREATE_QUEUE_TABLE Procedure on page 17-26	Creates a queue table for messages of a predefined type
DEL_ALIAS_FROM_LDAP Procedure on page 17-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
DISABLE_DB_ACCESS Procedure on page 17-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DISABLE_PROPAGATION_SCHEDULE Procedure on page 17-31	Disables a propagation schedule
DROP_AQ_AGENT Procedure on page 17-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
DROP_QUEUE Procedure on page 17-33	Drops an existing queue
DROP_QUEUE_TABLE Procedure on page 17-34	Drops an existing queue table
ENABLE_DB_ACCESS Procedure on page 17-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user
ENABLE_JMS_TYPES Procedure on page 17-36	A precondition for the enqueue of JMS types and XML types

Table 17–10 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
ENABLE_PROPAGATION_SCHEDULE Procedure on page 17-37	Enables a previously disabled propagation schedule
GET_WATERMARK Procedure on page 17-38	Retrieves the value of watermark set by the `SET_WATERMARK Procedure`
GRANT_QUEUE_PRIVILEGE Procedure on page 17-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 17-40	Grants Oracle Streams AQ system privileges to users and roles
MIGRATE_QUEUE_TABLE Procedure on page 17-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 17-42	Purges messages from queue tables
QUEUE_SUBSCRIBERS Function on page 17-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
REMOVE_SUBSCRIBER Procedure on page 17-45	Removes a default subscriber from a queue
REVOKE_QUEUE_PRIVILEGE Procedure on page 17-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 17-47	Revokes Oracle Streams AQ system privileges from users and roles
SCHEDULE_PROPAGATION Procedure on page 17-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
SET_WATERMARK Procedure on page 17-50	Used for Oracle Streams AQ notification to specify and limit memory use
START_QUEUE Procedure on page 17-51	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 17-52	Disables enqueuing or dequeuing on the specified queue
UNSCHEDULE_PROPAGATION Procedure on page 17-53	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 17-54	Verifies that the source and destination queues have identical types

ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
   alias          IN VARCHAR2,
   obj_location   IN VARCHAR2);
```

Parameters

Table 17–11 ADD_ALIAS_TO_LDAP Procedure Parameters

Parameter	Description
`alias`	Name of the alias. Example: `west_shipping`.
`obj_location`	The distinguished name of the object (queue, agent or connection factory) to which `alias` refers.

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.

ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
   queue_name      IN    VARCHAR2,
   subscriber      IN    sys.aq$_agent,
   rule            IN    VARCHAR2 DEFAULT NULL,
   transformation  IN    VARCHAR2 DEFAULT NULL
   queue_to_queue  IN    BOOLEAN DEFAULT FALSE,
   delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 17–12 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being defined.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule   => 'PRIORITY <= 3 AND CORRID =  ''FROM JAPAN'''
```

Note that these are all single quotation marks.

ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 17–13 ALTER_AQ_AGENT Procedure Parameters

Parameter	Description
`agent_name`	Specifies the username of the Oracle Streams AQ Internet agent.
`certification_location`	Agent's certificate location in LDAP (default is `NULL`). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
`enable_http`	`TRUE` means the agent can access Oracle Streams AQ through HTTP. `FALSE` means the agent cannot access Oracle Streams AQ through HTTP.
`enable_smtp`	`TRUE` means the agent can access Oracle Streams AQ through SMTP (e-mail). `FALSE` means the agent cannot access Oracle Streams AQ through SMTP.
`enable_anyp`	`TRUE` means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
   queue_name           IN    VARCHAR2,
   destination          IN    VARCHAR2 DEFAULT NULL,
   duration             IN    NUMBER   DEFAULT NULL,
   next_time            IN    VARCHAR2 DEFAULT NULL,
   latency              IN    NUMBER   DEFAULT 60,
   destination_queue    IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–14 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.
destination_ queue	Name of the target queue to which messages are to be propagated in the form of a dblink

ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters max_retries, retention_time, and retry_delay are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
   queue_name        IN    VARCHAR2,
   max_retries       IN    NUMBER   DEFAULT NULL,
   retry_delay       IN    NUMBER   DEFAULT NULL,
   retention_time    IN    NUMBER   DEFAULT NULL,
   auto_commit       IN    BOOLEAN  DEFAULT TRUE,
   comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–15 ALTER_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be altered
max_retries	Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means that the value will not be altered. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the value will not be altered.
auto_commit	TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.
comment	User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value will not be changed.

ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
   queue_table          IN   VARCHAR2,
   comment              IN   VARCHAR2       DEFAULT NULL,
   primary_instance     IN   BINARY_INTEGER DEFAULT NULL,
   secondary_instance   IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 17–16 ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created.
comment	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.
primary_instance	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.

ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
   queue_name     IN    VARCHAR2,
   subscriber     IN    sys.aq$_agent,
   rule           IN    VARCHAR2
   transformation IN    VARCHAR2);
```

Parameters

Table 17–17 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being altered. See "AQ$_ AGENT Type" on page 184-3.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the *schema*.AQ$*queue_table*_R and *schema*.AQ$*queue_table*_S views.

CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 17–18 CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Streams AQ Internet agents.

CREATE_NP_QUEUE Procedure

> **Note:** nonpersistent queues are deprecated in Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent RAW queue.

Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
   queue_name              IN        VARCHAR2,
   multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,
   comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–19 CREATE_NP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Reference.*
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
comment	User-specified description of the queue. This user comment is added to the queue catalog.

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ$_MEM_SC or AQ$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with CREATE_NP_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the LISTEN call on a nonpersistent queue.

CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (
   queue_name          IN       VARCHAR2,
   queue_table         IN       VARCHAR2,
   queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,
   max_retries         IN       NUMBER         DEFAULT NULL,
   retry_delay         IN       NUMBER         DEFAULT 0,
   retention_time      IN       NUMBER         DEFAULT 0,
   dependency_tracking IN       BOOLEAN        DEFAULT FALSE,
   comment             IN       VARCHAR2       DEFAULT NULL,
   auto_commit         IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

Table 17–20 CREATE_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Reference* with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.

Table 17–20 (Cont.) CREATE_QUEUE Procedure Parameters

Parameter	Description
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
   queue_table          IN      VARCHAR2,
   queue_payload_type   IN      VARCHAR2,
   [storage_clause      IN      VARCHAR2        DEFAULT NULL,]
   sort_list            IN      VARCHAR2        DEFAULT NULL,
   multiple_consumers   IN      BOOLEAN         DEFAULT FALSE,
   message_grouping     IN      BINARY_INTEGER  DEFAULT NONE,
   comment              IN      VARCHAR2        DEFAULT NULL,
   auto_commit          IN      BOOLEAN         DEFAULT TRUE,
   primary_instance     IN      BINARY_INTEGER  DEFAULT 0,
   secondary_instance   IN      BINARY_INTEGER  DEFAULT 0,
   compatible           IN      VARCHAR2        DEFAULT NULL,
   secure               IN      BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 17–21 CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See Type Name on page 16-4 for valid values for this parameter.
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument.The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLEPSACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Reference* for the usage of these parameters.

Table 17–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
sort_list	The columns to be used as the sort key in ascending order. This parameter has the following format: '*sort_column_1*,*sort_column_2*' The allowed column names are priority and enq_time. If both columns are specified, then *sort_column_1* defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified.
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.
message_grouping	Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.
comment	User-specified description of the queue table. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Note: This parameter has been deprecated.
primary_instance	The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.
compatible	The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.

Table 17–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
secure	This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- aq$_*queue_table_name*_e, a default exception queue associated with the queue table
- aq$*queue_table_name*, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- aq$_*queue_table_name*_t, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- aq$_*queue_table_name*_i, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- aq$_*queue_table_name*_s, a table for storing information about the subscribers
- aq$_*queue_table_name*_r, a table for storing information about rules on subscriptions

aq$_*queue_table_name*_h, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8*i* release 8.1.5 or later. See the *Oracle Streams Advanced Queuing User's Guide and Reference* for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the primary_instance and secondary_instance only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(
   alias IN VARCHAR2);
```

Parameters

Table 17–22 DEL_ALIAS_FROM_LDAP Procedure Parameters

Parameter	Description
alias	The alias to be removed.

DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 17–23 DISABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
   queue_name            IN   VARCHAR2,
   destination           IN   VARCHAR2 DEFAULT NULL,
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–24 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (
  agent_name                IN VARCHAR2)
```

Parameters

Table 17–25 DROP_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent

DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (
   queue_name        IN    VARCHAR2,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17–26 DROP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.

DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (
   queue_table       IN    VARCHAR2,
   force             IN    BOOLEAN DEFAULT FALSE,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17–27 DROP_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.

ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 17–28 ENABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.

ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams `Sys.Anydata` queues unless you call this procedure after `DBMS_STREAMS_ADM.SET_UP_QUEUE`. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (
   queue_table   IN   VARCHAR2);
```

Parameters

Table 17–29 ENABLE_JMS_TYPES Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be enabled for JMS and XML types.

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
   queue_name          IN   VARCHAR2,
   destination         IN   VARCHAR2 DEFAULT NULL,
   destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 17–30 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
`queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`destination_queue`	Name of the target queue to which messages are to be propagated in the form of a `dblink`

GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by `SET_WATERMARK`.

Syntax

```
DBMS_AQADM.GET_WATERMARK (
   wmvalue     OUT      NUMBER);
```

Parameters

Table 17–31 GET_WATERMARK Procedure Parameter

Parameter	Description
`wmvalue`	Watermark value in megabytes.

GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
   privilege        IN    VARCHAR2,
   queue_name       IN    VARCHAR2,
   grantee          IN    VARCHAR2,
   grant_option     IN    BOOLEAN := FALSE);
```

Parameters

Table 17–32 GRANT_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
grant_option	Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
   privilege         IN    VARCHAR2,
   grantee           IN    VARCHAR2,
   admin_option      IN    BOOLEAN := FALSE);
```

Parameters

Table 17–33 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
admin_option	Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.

MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (
   queue_table   IN   VARCHAR2,
   compatible    IN   VARCHAR2);
```

Parameters

Table 17–34 MIGRATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be migrated.
`compatible`	Set this to `8.1` to upgrade an 8.0-compatible queue table, or set this to `8.0` to downgrade an 8.1-compatible queue table.

PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
   queue_table        IN   VARCHAR2,
   purge_condition    IN   VARCHAR2,
   purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Chapter 184, "Oracle Streams AQ TYPEs".

Parameters

Table 17–35 PURGE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Specifies the name of the queue table to be purged.
purge_condition	Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table_name view. When specifying the purge_condition, qualify the column names in aq$queue_table_name view with qtview. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or '' (two single quotes).
purge_options	Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter. ■ If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. ■ delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.

Usage Notes

- You an purge selected messages from the queue table by specifying a purge_condition. Table 17–35 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.

- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`. Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$`*`queue_table_name`*`_S` view.

Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
   queue_name         IN         VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

Parameters

Table 17–36 QUEUE_SUBSCRIBERS Function Parameters

Parameter	Description
`queue_name`	Specifies the queue whose subscribers are to be printed.

REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (
   queue_name          IN          VARCHAR2,
   subscriber          IN          sys.aq$_agent);
```

Parameters

Table 17–37 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See AQ$_AGENT Type on page 184-3.

REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
   privilege         IN      VARCHAR2,
   queue_name        IN      VARCHAR2,
   grantee           IN      VARCHAR2);
```

Parameters

Table 17–38 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
   privilege         IN   VARCHAR2,
   grantee           IN   VARCHAR2);
```

Parameters

Table 17–39 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.

SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
   queue_name          IN    VARCHAR2,
   destination         IN    VARCHAR2 DEFAULT NULL,
   start_time          IN    DATE     DEFAULT SYSDATE,
   duration            IN    NUMBER   DEFAULT NULL,
   next_time           IN    VARCHAR2 DEFAULT NULL,
   latency             IN    NUMBER   DEFAULT 60,
   destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–40 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in

either the same or different queues, the message is propagated to all of them at the same time.

SET_WATERMARK Procedure

This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

Syntax

```
DBMS_AQADM.SET_WATERMARK (
   wmvalue     IN      NUMBER);
```

Parameters

Table 17–41 SET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
   queue_name       IN     VARCHAR2,
   enqueue          IN     BOOLEAN DEFAULT TRUE,
   dequeue          IN     BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17–42 START_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
   queue_name      IN   VARCHAR2,
   enqueue         IN   BOOLEAN DEFAULT TRUE,
   dequeue         IN   BOOLEAN DEFAULT TRUE,
   wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 17–43 STOP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
   queue_name         IN  VARCHAR2,
   destination        IN  VARCHAR2 DEFAULT NULL
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 17–44 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
   src_queue_name    IN    VARCHAR2,
   dest_queue_name   IN    VARCHAR2,
   destination       IN    VARCHAR2 DEFAULT NULL,
   rc                OUT   BINARY_INTEGER);
```

Parameters

Table 17–45 VERIFY_QUEUE_TYPES Procedure Parameters

Parameter	Description
`src_queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`dest_queue_name`	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`rc`	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in `rc`.

18

DBMS_AQELM

The DBMS_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide and Reference* for detailed information about DBMS_AQELM

This chapter contains the following topic:

Summary of DBMS_AQELM Subprograms

Table 18–1 DBMS_ALERT Package Subprograms

Subprogram	Description
SET_MAILHOST Procedure on page 18-3	Sets the host name for the SMTP server that the database will uses send out e-mail notifications
SET_MAILPORT Procedure on page 18-4	Sets the port number for the SMTP server
SET_SENDFROM Procedure on page 18-5	Sets the sent-from e-mail address

SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (
   mailhost  IN  VARCHAR2);
```

Parameters

Table 18–2 SET_MAILHOST Procedure Parameters

Parameter	Description
mailhost	SMTP server host name.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```
DBMS_AQELM.SET_MAILPORT (
   mailport  IN NUMBER);
```

Parameters

Table 18–3 SET_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (
   sendfrom  IN  VARCHAR2);
```

Parameters

Table 18–4 SET_SENDFROM Procedure Parameters

Parameter	Description
sendfrom	The sent-from e-mail address.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications

19

DBMS_AQIN

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide and Reference* for detailed information about DBMS_AQIN

This chapter contains the following topic:

- Using DBMS_AQIN
  - Over view

Using DBMS_AQIN

This section contains topics which relate to using the `DBMS_AQIN` package.

Overview

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

Note that you can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINSTRATOR_ROLE.

20

DBMS_CAPTURE_ADM

The DBMS_CAPTURE_ADM package, one of a set of Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and capture processes

This chapter contains the following topic:

Summary of DBMS_CAPTURE_ADM Subprograms

Table 20–1 DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
ABORT_GLOBAL_INSTANTIATION Procedure on page 20-3	Reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SCHEMA_INSTANTIATION Procedure on page 20-4	Reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION and PREPARE_TABLE_INSTANTIATION procedures
ABORT_TABLE_INSTANTIATION Procedure on page 20-5	Reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure
ALTER_CAPTURE Procedure on page 20-6	Alters a capture process
BUILD Procedure on page 20-11	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
CREATE_CAPTURE Procedure on page 20-12	Creates a capture process
DROP_CAPTURE Procedure on page 20-17	Drops a capture process
INCLUDE_EXTRA_ATTRIBUTE Procedure on page 20-19	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process
PREPARE_GLOBAL_INSTANTIATION Procedure on page 20-21	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SCHEMA_INSTANTIATION Procedure on page 20-22	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_TABLE_INSTANTIATION Procedure on page 20-23	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
SET_PARAMETER Procedure on page 20-24	Sets a capture process parameter to the specified value
START_CAPTURE Procedure on page 20-26	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
STOP_CAPTURE Procedure on page 20-27	Stops the capture process from mining redo logs

Note: All subprograms commit unless specified otherwise.

ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION();
```

ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. It also reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE_SCHEMA_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure for tables in the specified schema

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
   schema_name  IN  VARCHAR2);
```

Parameter

Table 20–2 ABORT_SCHEMA_INSTANTIATION Procedure Parameter

Parameter	Description
schema_name	The name of the schema for which to abort the effects of preparing instantiation

ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
   table_name  IN  VARCHAR2);
```

Parameter

Table 20–3 ABORT_TABLE_INSTANTIATION Procedure Parameter

Parameter	Description
table_name	The name of the table for which to abort the effects of preparing instantiation, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

ALTER_CAPTURE Procedure

This procedure alters a capture process.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
   capture_name              IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   start_scn                 IN  NUMBER    DEFAULT NULL,
   use_database_link         IN  BOOLEAN   DEFAULT NULL,
   first_scn                 IN  NUMBER    DEFAULT NULL,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE,
   capture_user              IN  VARCHAR2  DEFAULT NULL,
   checkpoint_retention_time IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 20–4 ALTER_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `HR` schema named `job_capture_rules`, enter `hr.job_capture_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_rule_set` parameter is set to `FALSE`, then the procedure retains any existing positive rule set. If you specify `NULL` and the `remove_rule_set` parameter is set to `TRUE`, then the procedure removes any existing positive rule set. See Also**:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
start_scn	A valid SCN for the database from which the capture process should start capturing changes. The SCN value specified must be greater than or equal to the first SCN for the capture process. An error is returned if an invalid SCN is specified.
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
`first_scn`	Specifies the lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements: ■ It must be greater than the current first SCN for the capture process. ■ It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero. ■ It must be less than or equal to the required checkpoint SCN for the capture process. An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 20-10 for information about determining an SCN value that meets all of these conditions. When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. Also, if the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.
`negative_rule_set_name`	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a negative rule set in the `hr` schema named `neg_capture_rules`, enter `hr.neg_capture_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `FALSE`, then the procedure retains any existing negative rule set. If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `TRUE`, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified capture process. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, make sure the capture user has the following privileges: ■ EXECUTE privilege on the rule sets used by the capture process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process These privileges must be granted directly to the capture user. They cannot be granted through roles. By default, this parameter is set to the user who created the capture process by running either the CREATE_CAPTURE procedure in this package or one of the following procedures in the DBMS_STREAMS_ADM package with the streams_type parameter set to capture: ADD_GLOBAL_RULES ADD_SCHEMA_RULES ADD_TABLE_RULES ADD_SUBSET_RULES **Note:** If the specified user is dropped using DROP USER... CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.

Table 20–4 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
checkpoint_retention_time	Either the number of days that a capture process should retain checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the first_scn parameter. The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
   FROM DBA_CAPTURE;
```

Also, a capture process is stopped and restarted automatically when you change the value of one or more of the following ALTER_CAPTURE procedure parameters:

- start_scn
- capture_user

BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `first_scn`, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(
   first_scn  OUT  NUMBER);

DBMS_CAPTURE_ADM.BUILD();
```

Parameters

Table 20–5 BUILD Procedure Parameter

Parameter	Description
`first_scn`	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

Usage Notes

You can run this procedure multiple times at a source database.

If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.

After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes.You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

- *Oracle Streams Concepts and Administration* for more information about creating a capture process
- Chapter 92, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
   queue_name                 IN  VARCHAR2,
   capture_name               IN  VARCHAR2,
   rule_set_name              IN  VARCHAR2  DEFAULT NULL,
   start_scn                  IN  NUMBER    DEFAULT NULL,
   source_database            IN  VARCHAR2  DEFAULT NULL,
   use_database_link          IN  BOOLEAN   DEFAULT FALSE,
   first_scn                  IN  NUMBER    DEFAULT NULL,
   logfile_assignment         IN  VARCHAR2  DEFAULT 'implicit',
   negative_rule_set_name     IN  VARCHAR2  DEFAULT NULL,
   capture_user               IN  VARCHAR2  DEFAULT NULL,
   checkpoint_retention_time  IN  NUMBER    DEFAULT 60);
```

Parameters

Table 20–6 CREATE_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [*schema_name*.]*queue_name*. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the capture process is created.
capture_name	The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the capture process is created.

Table 20–6 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process
start_scn	A valid SCN for the database from which the capture process should start capturing changes. If the specified value is lower than the current SCN of the source database, then either the first_scn should be specified, or the SCN value specified for start_scn must be greater than or equal to the first SCN of an existing capture process which has taken at least one checkpoint. If start_scn is NULL and no value is specified for the first_scn parameter, then the current SCN of the database is used as start SCN. If start_scn is NULL and a non-NULL value is specified for the first_scn parameter, then the first_scn value is used. If a value is specified for both start_scn and first_scn, then the start_scn value must be greater than or equal to the first_scn value. An error is returned if an invalid SCN is specified.
source_database	The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.

Table 20–6 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually: ■ Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created. ■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process. ■ Prepare source database objects for instantiation.
first_scn	Specifies the lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available.
logfile_assignment	If implicit, the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database. If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR *logminer_session_name* clause when the redo log file is added manually to the downstream database. If explicit, then redo transport services cannot be used to add redo log files to the capture process being created. If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. See Also: "Usage Notes" on page 20-16 for information about adding redo log files manually

Table 20–6 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used. Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.
checkpoint_retention_time	Either the number of days that a capture process should retain checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time

Usage Notes

The user who invokes this procedure must be granted DBA role.

The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, make sure the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process
- EXECUTE privilege on all rule-based transformation functions used in the rule set
- EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process

These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, make sure you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

If you specify explicit for the logfile_assignment parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
   file_name FOR capture_process;
```

Here, *file_name* is the name of the redo log file being added and *capture_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture_process* is equivalent to the *logminer_session_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

See Also: *Oracle Database SQL Reference* for more information about the ALTER DATABASE statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

DROP_CAPTURE Procedure

This procedure drops a capture process.

Note: A capture process must be stopped before it can be dropped.

See Also: "STOP_CAPTURE Procedure" on page 20-27

Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
   capture_name           IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–7 DROP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Streams client. Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES

- DBA_STREAMS_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Streams data dictionary views

INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
   capture_name    IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 20–8 INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. Specify an existing capture process name. Do not specify an owner.
attribute_name	The name of the attribute to be included in or excluded from LCRs captured by the capture process. The following names are valid settings: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in a Real Application Clusters environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.
include	If TRUE, then the specified attribute is included in LCRs captured by the capture process If FALSE, then the specified attribute is excluded from LCRs captured by the capture process

Usage Notes

The redo log contains information about each change made to a database, and some of this information is not captured by a capture process unless you use this procedure to instruct a capture process to capture it. This procedure enables you to specify extra

information in the redo log that a capture process should capture. If you want to exclude an extra attribute that is being captured by a capture process, then specify the attribute and specify `FALSE` for the `include` parameter.

PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameter

Table 20–9 PREPARE_GLOBAL_INSTANTIATION Procedure Parameter

Parameter	Description
`supplemental_logging`	Either `none`, `keys`, or `all`. If `none` is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying `keys` does not enable supplemental logging of bitmap join index columns. If `all` is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, and user-defined type.

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
   schema_name           IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 20–10 PREPARE_SCHEMA_INSTANTIATION Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema. For example, `hr`.
`supplemental_logging`	Either `none`, `keys`, or `all`.
	If `none` is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.
	If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying `keys` does not enable supplemental logging of bitmap join index columns.
	If `all` is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, and user-defined type.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table.

This procedure records the lowest SCN of the table for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
   table_name            IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 20–11 PREPARE_TABLE_INSTANTIATION Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`supplemental_logging`	Either `none`, `keys`, or `all`.
	If `none` is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.
	If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying `keys` does not enable supplemental logging of bitmap join index columns.
	If `all` is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, and user-defined type.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(
   capture_name  IN  VARCHAR2,
   parameter     IN  VARCHAR2,
   value         IN  VARCHAR2);
```

Parameters

Table 20–12 SET_PARAMETER Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Capture Process Parameters" on page 20-24 for a list of these parameters.
value	The value to which the parameter is set

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 20–13 Capture Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit.
downstream_real_time_mine	Y or N	Y for local capture processes N for downstream capture processes	If Y, then the capture process is a real-time downstream capture process. After setting this parameter to y, switch the redo log file at the source database using the SQL statement ALTER SYSTEM ARCHIVE LOG CURRENT to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See *Oracle Streams Concepts and Administration* for information about creating a real-time downstream capture process. If N, then the capture process is an archived-log downstream capture process. This parameter is ignored for local capture processes.
maximum_scn	A valid SCN or infinite	infinite	The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If infinite, then the capture process runs regardless of the SCN value.

Table 20–13 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
message_limit	A positive integer or infinite	infinite	The capture process stops after capturing the specified number of messages. If infinite, then the capture process continues to run regardless of the number of messages captured.
parallelism	A positive integer	1	The number of parallel execution servers that can concurrently mine the redo log Setting the parallelism parameter to a number higher than the number of available parallel execution servers might disable the capture process. Make sure the PROCESSES and PARALLEL_MAX_SERVERS initialization parameters are set appropriately when you set the parallelism capture process parameter. **Note: When you change the value of this parameter, the capture process is stopped and restarted automatically.**
startup_seconds	0, a positive integer, or infinite	0	The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If infinite, then the capture process does not start until another instantiation of the same capture process finishes.
time_limit	A positive integer or infinite	infinite	The capture process stops as soon as possible after the specified number of seconds since it started. If infinite, then the capture process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
write_alert_log	Y or N	Y	If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify infinite for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.

START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

See Also: Chapter 106, "DBMS_STREAMS_ADM"

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(
   capture_name  IN  VARCHAR2);
```

Parameters

Table 20–14 START_CAPTURE Procedure Parameter

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A NULL setting is not allowed.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process (c*nnn*) is an Oracle background process.

STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

The stop status is persistently recorded. Hence, if the status is DISABLED, then the capture process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
   capture_name  IN  VARCHAR2,
   force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–15 STOP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. A NULL setting is not allowed. Do not specify an owner.
force	This parameter is reserved for future use. Currently, valid BOOLEAN settings are ignored.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup. A capture process (*cnnn*) is an Oracle background process.

21

DBMS_CDC_PUBLISH

The DBMS_CDC_PUBLISH package, one of a set of Change Data Capture packages, is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one **publisher** who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data. Subscribers access the published data using the DBMS_CDC_SUBSCRIBE package.

Note: In previous releases, this package was named DBMS_LOGMNR_CDC_PUBLISH. Beginning with Oracle Database 10*g*, the LOGMNR string has been removed from the name, resulting in the name DBMS_CDC_PUBLISH. Although both variants of the name are still supported, the variant with the LOGMNR string has been deprecated and may not be supported in a future release.

See Also: *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture

This chapter contains the following topics:

Using DBMS_CDC_PUBLISH

This section contains the following topics, which relate to using the `DBMS_CDC_PUBLISH` package:

Overview

Through the DBMS_CDC_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the subprograms in the DBMS_CDC_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS_CDC_SUBSCRIBE package.)

See Also: Chapter 22, "DBMS_CDC_SUBSCRIBE" for information on the package used to subscribe to published change data

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10*g*:

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION` with a subscription handle

  When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW`

  Dropping a subscriber view is now performed automatically by Change Data Capture.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_CDC_PUBLISH package. Additional privileges and roles are required depending on the publishing mode and whether the publisher is on the source or staging database. See the section on Granting Privileges and Roles to the Publisher in *Oracle Database Data Warehousing Guide* for details.

Views

The DBMS_CDC_PUBLISH package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_PUBLISH Subprograms

Table 21–1 describes the subprograms in the DBMS_CDC_PUBLISH supplied package and the mode or modes with which each can be used. A value of All in the Mode column indicates that the subprogram can be used with synchronous and all modes of asynchronous Change Data Capture, a value of Asynchronous in the Mode column indicates that the subprogram can be used with all modes of asynchronous Change Data Capture (HotLog, Distributed HotLog, and AutoLog).

Table 21–1 DBMS_CDC_PUBLISH Package Subprograms

Subprogram	Mode	Description
ALTER_AUTOLOG_CHANGE_SOURCE Procedure on page 21-8	Asynchronous AutoLog	Changes one or more properties of an existing AutoLog change source
ALTER_CHANGE_SET Procedure on page 21-10	All	Changes one or more of the properties of an existing change set
ALTER_CHANGE_TABLE Procedure on page 21-13	All	Adds or drops columns for an existing change table, or changes the properties of an existing change table
ALTER_HOTLOG_CHANGE_SOURCE Procedure on page 21-15	Asynchronous Distributed HotLog	Changes one or more properties of an existing Distributed HotLog change source
CREATE_AUTOLOG_CHANGE_SOURCE Procedure on page 21-17	Asynchronous AutoLog	Creates an AutoLog change source
CREATE_CHANGE_SET Procedure on page 21-19	All	Creates a change set
CREATE_CHANGE_TABLE Procedure on page 21-22	All	Creates a change table in a specified schema
CREATE_HOTLOG_CHANGE_SOURCE Procedure on page 21-26	Asynchronous Distributed HotLog	Creates a Distributed HotLog change source
DROP_CHANGE_SET Procedure on page 21-28	All	Drops an existing change set
DROP_CHANGE_SOURCE Procedure on page 21-29	Asynchronous Autolog and Asynchronous Distributed Hotlog	Drops an existing AutoLog or Distributed HotLog change source
DROP_CHANGE_TABLE Procedure on page 21-30	All	Drops an existing change table
DROP_SUBSCRIPTION Procedure on page 21-31	All	Allows a publisher to drop a subscription that was created by a subscriber
PURGE Procedure on page 21-32	All	Removes unneeded rows from all change tables in the staging database
PURGE_CHANGE_SET Procedure on page 21-33	All	Removes unneeded rows from all change tables in a specified change set
PURGE_CHANGE_TABLE Procedure on page 21-34	All	Removes unneeded rows from a specified change table

ALTER_AUTOLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing AutoLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_AUTOLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     remove_description  IN CHAR DEFAULT 'N',
     first_scn           IN NUMBER DEFAULT NULL);
```

Parameters

Table 21–2 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
`change_source_name`	Name of an existing AutoLog change source. Change source names follow Oracle schema object naming rules.
`description`	New description of the change source. The description must be specified using 255 or fewer characters.
`remove_description`	A value of `'Y'` or `'N'`. If the value is `'Y'`, then the current description is changed to `NULL`. If the value is `'N'`, then the current description is unchanged. Do not specify the description parameter with this parameter.
`first_scn`	New first SCN.

Exceptions

Table 21–3 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
`ORA-31401`	Specified change source is not an existing change source
`ORA-31452`	Invalid value for parameter, expecting: `Y` or `N`
`ORA-31455`	Nothing to `ALTER`
`ORA-31497`	Invalid value specified for `first_scn`
`ORA-31498`	The `description` and `remove_description` parameters cannot both be specified
`ORA-31499`	Null value specified for required parameter
`ORA-31501`	Specified change source is not an AutoLog change source
`ORA-31504`	Cannot alter or drop predefined change source
`ORA-31507`	Specified parameter value longer than maximum length

Usage Notes

- Properties supplied to this procedure with a `NULL` value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

See Also: The section on asynchronous Change Data Capture and redo log files in *Oracle Database Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

ALTER_CHANGE_SET Procedure

This procedure changes the properties of an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_SET(
     change_set_name         IN VARCHAR2,
     description             IN VARCHAR2 DEFAULT NULL,
     remove_description      IN CHAR DEFAULT 'N',
     enable_capture          IN CHAR DEFAULT NULL,
     recover_after_error     IN CHAR DEFAULT NULL,
     remove_ddl              IN CHAR DEFAULT NULL,
     stop_on_ddl             IN CHAR DEFAULT NULL);
```

Parameters

Table 21–4 ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
description	New description of the change set. Specify using 255 or fewer characters.
remove_ description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_capture	A value of 'Y' or 'N'. If the value is 'Y', then change data capture is enabled for this change set. If the value is 'N', then change data capture is disabled for this change set. Synchronous change sets are created with change data capture enabled and cannot be disabled. Asynchronous change sets are created with change data capture disabled.
recover_after_ error	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture will attempt to recover from earlier capture errors. If the value is 'N', then Change Data Capture will not attempt to recover from earlier capture errors.
remove_ddl	A value of 'Y' or 'N'. If the value is 'Y' and the value of the recover_after_error parameter is 'Y', then any DDL records that may have caused capture errors will be filtered out during recovery. If the value is 'N', then DDL records that may have caused capture errors will not be filtered out during recovery. This parameter has meaning only when the recover_after_error parameter is specified with a value of 'Y'.

Table 21–4 (Cont.) ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
stop_on_ddl	A value of 'Y' or 'N'.
	If the value is 'Y', then Change Data Capture stops when a DDL event is detected.
	If the value is 'N', then Change Data Capture continues when a DDL event is detected.
	See the Usage Notes for additional information about this parameter.

Exceptions

Table 21–5 ALTER_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31455	Invalid lock handle while acquiring lock
ORA-31468	Cannot process DDL change record
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, SYNC_SET, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: enable_capture, recover_after_error, remove_ddl, and stop_on_ddl.
- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can alter more than one parameter at a time.
- Enabling or disabling an asynchronous HotLog or AutoLog change set starts or stops the Oracle Streams capture process and apply process underlying the change set. Enabling or disabling an asynchronous Distributed HotLog change set starts or stops the Oracle Streams apply process underlying the change set.
- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity

to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to `'Y'` and any of the following statements is encountered:

* `ANALYZE TABLE`
* `LOCK TABLE`
* `GRANT` privileges to access a table
* `REVOKE` privileges to access a table
* `COMMENT` on a table
* `COMMENT` on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

– When the `stop_on_ddl` parameter is set to `'N'`, Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. There are also system conditions that can cause capture errors, such as being out of disk space.

See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

- The publisher can attempt to recover an asynchronous change set after a capture error by specifying `'Y'` for the `recover_after_error` parameter. Capture errors can occur when any of the following is true:
  – The `stop_on_ddl` parameter is set to `'Y'` and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify `'Y'` for the `remove_ddl` parameter.
  – The `stop_on_ddl` parameter is set to `'N'` and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.
  – A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table *string.string* partition *string* by *string* in tablespace *string*).

  See Also: *Oracle Database Data Warehousing Guide* for more information on how to recover from a capture error.

ALTER_CHANGE_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE(
     owner                  IN VARCHAR2,
     change_table_name      IN VARCHAR2,
     operation              IN VARCHAR2,
     column_list            IN VARCHAR2,
     rs_id                  IN CHAR,
     row_id                 IN CHAR,
     user_id                IN CHAR,
     timestamp              IN CHAR,
     object_id              IN CHAR,
     source_colmap          IN CHAR,
     target_colmap          IN CHAR);
```

Parameters

Table 21–6 ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	The schema that owns the change table.
change_table_name	The change table that is being altered. Change table names follow the Oracle schema object naming rules.
operation	Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.
column_list	User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.
rs_id row_id user_id timestamp object_id source_colmap target_colmap	Each listed parameter specifies a particular control column, as follows: ■ The rs_id parameter specifies the RSID$ control column. ■ The row_id parameter specifies the ROW_ID$ control column. ■ The user_id parameter specifies the USERNAME$ control column. ■ The timestamp parameter specifies the TIMESTAMP$ control column. ■ The object_id parameter specifies the SYS_NC_OID$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP$ control column. Each parameter must have a value of either 'Y' or 'N', where: ■ 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the operation parameter. ■ 'N': Neither adds the specified control column, nor drops it from the change table.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns.

Exceptions

Table 21–7 ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31403	Specified change table already contains the specified column
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column *control-column-name*
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31423	Specified change table does not contain the specified column
ORA-31454	Invalid value specified for operation parameter, expecting ADD or DROP
ORA-31455	Nothing to alter
ORA-31456	Error executing a procedure in the DBMS_CDC_UTILITY package
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the ALTER_CHANGE_TABLE procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the column_list parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

  See Also: *Oracle Database Data Warehousing Guide* for information about the impact on subscriptions when a publisher adds a column to a change table.

ALTER_HOTLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing Distributed HotLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_HOTLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     remove_description  IN CHAR DEFAULT 'N',
     enable_source       IN CHAR DEFAULT NULL);
```

Parameters

Table 21–8 ALTER_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of an existing Distributed HotLog change source. Change source names follow Oracle schema object naming rules.
description	New description of the change source. The description must be specified using 255 or fewer characters.
remove_description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_source	A value of 'Y' or 'N'. If the value is 'Y', then the change source is enabled. If the value is 'N', then the change source is disabled.

Exceptions

Table 21–9 ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Change source is not an existing change source
ORA-31455	Nothing to ALTER
ORA-31480	Staging database and source database cannot be the same
ORA-31481	Change source is not a HotLog change source
ORA-31482	Invalid option for non-distributed HotLog change source
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Parameter value longer than maximum length
ORA-31532	Cannot enable change source

Table 21–9 (Cont.) ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- Enabling or disabling a Distributed HotLog change source starts or stops the Oracle Streams capture process that underlies the change source.
- This procedure cannot be used to alter the change source for the asynchronous HotLog mode of Change Database Capture. The change source for the asynchronous HotLog mode is the predefined change source, HOTLOG_SOURCE, which cannot be altered.

CREATE_AUTOLOG_CHANGE_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on of a set of redo log files automatically copied by redo transport services to the system on which the staging database resides.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     source_database     IN VARCHAR2,
     first_scn           IN NUMBER,
     online_log          IN CHAR DEFAULT 'N');
```

Parameters

Table 21–10 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source. Change source names follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	Global name of the change source's source database instance.
first_scn	The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.
online_log	A value of 'Y' or 'N' If the value is 'Y', then the change source uses the AutoLog online option to hot-mine the source database online redo log to gather change data. There can only be one change source with online_log='Y' on a given staging database. If the value is 'N', then the change source uses the AutoLog archive option to get change data from archived redo log files. There can be one or more change sources with online_log='N' on a given staging database.

Exceptions

Table 21–11 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source specified
ORA-31497	Invalid value specified for first_scn
ORA-31499	Null value specified for required parameter
ORA-31507	Specified parameter value is longer than the maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31535	Cannot support change source in this configuration

Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.

- The publisher must take care when specifying a value for the `source_database` parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the `GLOBAL_NAME` column in the `GLOBAL_NAME` view at the source database for the `source_database` parameter value.
- The publisher must configure redo transport services to automatically copy the log files to the system on which the staging database resides.

  See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on configuring redo transport services to automatically copy the log files to the system on which the staging database resides.

- An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The `CREATE_AUTOLOG_CHANGE_SOURCE` `first_scn` parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the `first_scn` parameter using either of the following methods:
  - Direct `DBMS_CAPTURE_ADM.BUILD` to return the value when the dictionary is built:

    ```
    SET SERVEROUTPUT ON
    VARIABLE FSCN NUMBER;
    BEGIN
     :FSCN := 0;
     DBMS_CAPTURE_ADM.BUILD(:FSCN);
     DBMS_OUTPUT.PUT_LINE('The first_scn value is ' || :FSCN);
    END;
    /
    The first_scn value is 207722
    ```

  - Make the following query on the source database. If this query returns multiple distinct values for `first_change#`, then the data dictionary has been extracted more than once and the publisher should choose the `first_change#` value that is the most appropriate to the change source.

    ```
    SELECT DISTINCT FIRST_CHANGE#, NAME
       FROM V$ARCHIVED_LOG
       WHERE DICTIONARY_BEGIN = 'YES';
    ```

    See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary.

- For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

  See Also: *Oracle Database Data Warehousing Guide* for information about supplemental logging.

CREATE_CHANGE_SET Procedure

This procedure allows the publisher to create a change set. For asynchronous HotLog and AutoLog Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET(
     change_set_name        IN VARCHAR2,
     description            IN VARCHAR2 DEFAULT NULL,
     change_source_name     IN VARCHAR2,
     stop_on_ddl            IN CHAR DEFAULT 'N',
     begin_date             IN DATE DEFAULT NULL,
     end_date               IN DATE DEFAULT NULL);
```

Parameters

Table 21–12 CREATE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set. Change set names follow the Oracle schema object naming rules.
description	Description of the change set. Specify using 255 or fewer characters.
change_source_name	Name of the existing change source to contain this change set.
stop_on_ddl	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture stops when a DDL event is detected. If the value is 'N', then Change Data Capture continues when a DDL event is detected. See the Usage Notes for additional information about this parameter.
begin_date	Date on which the publisher wants the change set to begin capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.
end_date	Date on which the publisher wants the change set to stop capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.

Exceptions

Table 21–13 CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31407	The end_date must be greater than the begin_date
ORA-31408	Invalid value specified for begin_scn or end_scn
ORA-31437	Duplicate change set specified
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31483	Cannot have spaces in the parameter
ORA-31485	Invalid database link

Table 21–13 (Cont.) CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31487	Cannot support begin dates or end dates in this configuration
ORA-31488	Cannot support change set in this configuration
ORA-31499	Null value specified for required parameter
ORA-31503	Invalid date supplied for begin_date or end_date
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: begin_date, end_date, and stop_on_ddl. The default values for the following parameters are the only supported values for asynchronous Distributed HotLog change sets: begin_date and end_date.
- When the change source is Distributed HotLog on a release of Oracle Database earlier than 10.2, Change Data Capture inserts rows into the CHANGE_PROPAGATION and CHANGE_PROPAGATION_SETS views on the staging database.
- An AutoLog online change source (created with online_log='Y') can only contain one change set.
- The begin_date and end_date parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:
  - When a begin_date is specified, changes from transactions that begin on or after that date are captured.
  - When a begin_date is not specified, capture starts with the earliest available change data.
  - When an end_date is specified, changes from transactions that are committed on or before that date are captured.
  - When an end_date is not specified, Change Data Capture continues indefinitely.
- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

    Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the stop_on_ddl parameter is set to 'Y' and any of the following statements is encountered:

    * ANALYZE TABLE
    * LOCK TABLE
    * GRANT privileges to access a table

  * `REVOKE` privileges to access a table
  * `COMMENT` on a table
  * `COMMENT` on a column

  These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

– When the `stop_on_ddl` parameter is set to `'N'`, Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

  See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

CREATE_CHANGE_TABLE Procedure

This procedure creates a change table in a specified schema.

> **Note:** Oracle recommends that the publisher be certain that the source table that will be referenced in a `CREATE_CHANGE_TABLE` procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the `stop_on_ddl` parameter set to `'Y'`.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE(
     owner                  IN VARCHAR2,
     change_table_name      IN VARCHAR2,
     change_set_name        IN VARCHAR2,
     source_schema          IN VARCHAR2,
     source_table           IN VARCHAR2,
     column_type_list       IN VARCHAR2,
     capture_values         IN VARCHAR2,
     rs_id                  IN CHAR,
     row_id                 IN CHAR,
     user_id                IN CHAR,
     timestamp              IN CHAR,
     object_id              IN CHAR,
     source_colmap          IN CHAR,
     target_colmap          IN CHAR,
     options_string         IN VARCHAR2);
```

Parameters

Table 21–14 CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description
`owner`	Name of the schema that owns the change table.
`change_table_name`	Name of the change table that is being created. Change table names follow the Oracle schema object naming rules.
`change_set_name`	Name of the change set in which this change table resides.
`source_schema`	The schema where the source table is located.
`source_table`	The source table from which the change records are captured.
`column_type_list`	The user columns and datatypes that are being tracked. Specify using a comma-delimited list.
`capture_values`	One of the following capture values for update operations: ■ `OLD`: Captures the original values from the source table. ■ `NEW`: Captures the changed values from the source table. ■ `BOTH`: Captures the original and changed values from the source table.

Table 21–14 (Cont.) CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description
rs_id row_id user_id timestamp object_id source_colmap target_colmap	Each listed parameter specifies a particular control column as follows: ■ The rs_id parameter specifies the RSID$ control column. ■ The row_id parameter specifies the ROW_ID$ control column. ■ The user_id parameter specifies the USERNAME$ control column. ■ The timestamp parameter specifies the TIMESTAMP$ control column. ■ The object_id parameter specifies the SYS_NC_OID$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP$ control column. Each parameter can have a value of 'Y' or 'N', where: ■ 'Y': Adds the specified control column to the change table. ■ 'N': Does not add the specified control column to the change table.
options_string	The syntactically correct options to be passed to a CREATE TABLE DDL statement. The options string is appended to the generated CREATE TABLE DDL statement after the closing parenthesis that defines the columns of the table. See the Usage Notes for more information.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns

Exceptions

Table 21–15 CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31402	Unrecognized parameter specified
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column *control-column-name*
ORA-31418	Specified source schema does not exist
ORA-31419	Specified source table does not exist
ORA-31420	Unable to submit the purge job
ORA-31421	Change table does not exist
ORA-31422	Owner schema does not exist
ORA-31438	Duplicate change table
ORA-31447	Cannot create change tables in the SYS schema
ORA-31450	Invalid value for change_table_name

Table 21–15 (Cont.) CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31451	Invalid value for capture_values, expecting: OLD, NEW, or BOTH
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31467	No column found in the source table
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.
- A change table is a database table that contains two types of columns:
  - User columns, which are copies of actual columns of source tables that reside in the change table.
  - Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.
- If there are multiple publishers on the staging database for the Distributed HotLog mode of Change Data capture, and one publisher defines a change table in another publisher's Distributed HotLog change set, then Change Data Capture uses the database link established by the publisher who created the change set to access the source database. Therefore, the database link to the source database established by the publisher who created the change set must be intact for the change table to be successfully created. If the change set publisher's database link is not present when creating a change table, an error is returned indicating that the connection description for the remote database was not found.
- The publisher must not attempt to control a change table's partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.
- When creating a change table for any mode of asynchronous Change Data Capture, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode of Change Data Capture, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.
- When the publisher specifies the rs_id parameter, the RSID$ column is added to the change table. The RSID$ column value reflects an operation's capture order within a transaction, but not across transactions. The publisher cannot use the RSID$ column value by itself to order committed operations across transactions; it must be used in conjunction with the CSCN$ column value.
- The publisher can control a change table's physical properties, tablespace properties, and so on, by specifying the options_string parameter. With the

options_string parameter, the publisher can set any option that is valid for the CREATE TABLE DDL statement (except for partitioning properties).

Note: How the publisher defines the options_string parameter can have an effect on the performance and operations in a Change Data Capture system. For example, if the publisher places several constraints in the options column, it can have a noticeable effect on performance. Also, if the publisher uses NOT NULL constraints and a particular column is not changed in an incoming change row, then the constraint can cause the INSERT operation to fail and the transaction that contains the INSERT operation to be rolled back.

- Oracle recommends that change tables not be created in system tablespaces. This can be accomplished if the publisher's default tablespace is not the system tablespace or if the publisher specifies a tablespace in the options_string parameter. If a tablespace is not specified by the publisher, and the publisher's default table space is the system tablespace, then Change Data Capture creates change tables in the system tablespace.

  See Also: *Oracle Database Data Warehousing Guide* for more information on, and examples of, creating change tables in tablespaces managed by the publisher.

CREATE_HOTLOG_CHANGE_SOURCE Procedure

This procedure creates a Distributed HotLog change source on the source database when the publisher runs this procedure from the staging database. A Distributed HotLog change source is based on data in the online redo log files that is automatically transferred to the staging database by Oracle Streams propagation.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_HOTLOG_CHANGE_SOURCE(
     change_source_name     IN VARCHAR2,
     description            IN VARCHAR2 DEFAULT NULL,
     source_database        IN VARCHAR2);
```

Parameters

Table 21–16 CREATE_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameters	Description
change_source_name	Name of the Distributed HotLog change source to be created. Each change source name must be unique and must follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	The name of the database link defined from the staging database to the source database, where the source database is Oracle9*i* Database, Database 10*g* Release 1, or Oracle Database 10*g*Release 2. See *Oracle Database Data Warehousing Guide* for information on creating database links for the Distributed HotLog mode of Change Data Capture.

Exceptions

Table 21–17 CREATE_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source
ORA-31480	Staging database and source database cannot be the same
ORA-31483	Cannot have spaces in the parameter
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31507	Parameter value longer than the maximum length
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- The publisher can use this procedure for the asynchronous Distributed HotLog mode of Change Data Capture only.

  This procedure cannot be used to create a change source for the asynchronous HotLog mode of Change Database Capture. The publisher must use the predefined change source, HOTLOG_SOURCE, for the asynchronous HotLog mode of Change Data Capture.

- A Distributed HotLog change source can contain one or more change sets, but they must all be on the same staging database.
- A staging database publisher cannot create multiple Distributed HotLog change sources with the same name, even when those change sources are on different source databases.
- When the publisher creates a change source on a release of Oracle Database earlier than 10.2, Change Data Capture:
  - Generates names for the Streams capture process, capture queue, and propagation based on the change source name. If a generated name is already in use, an error indicating that the capture process, queue, or propagation cannot be created is returned.
  - Inserts a row into the `CHANGE_SOURCES` view on the staging database where the `SOURCE_TYPE` column of the inserted row indicates that the source Oracle Database release is earlier than 10.2.
- Note that the database link indicated by the `source_database` parameter must exist when creating, altering, or dropping a Distributed HotLog change source and the change sets and change tables it contains. However, this database link is not required for change capture to occur. Once the required Distributed HotLog change sources, change sets and change tables are in place and enabled, this database link can be dropped without interrupting change capture. This database link would need to be recreated to create, alter, or drop Distributed HotLog change sources, change sets and change tables.

DROP_CHANGE_SET Procedure

This procedure drops an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SET(
     change_set_name     IN VARCHAR2);
```

Parameters

Table 21–18 DROP_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.

Exceptions

Table 21–19 DROP_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31411	Specified change set is referenced by a change table
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value is longer than maximum length

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC_SET, cannot be dropped.

DROP_CHANGE_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE_AUTOLOG_CHANGE_SOURCE procedure or an existing Distributed HotLog change source that was created with the CREATE_HOTLOG_CHANGE_SOURCE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE(
     change_source_name    IN VARCHAR2);
```

Parameters

Table 21–20 DROP_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.

Exceptions

Table 21–21 DROP_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31406	Specified change source is referenced by a change set
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG_SOURCE and SYNC_SOURCE, cannot be dropped.

DROP_CHANGE_TABLE Procedure

This procedure drops an existing change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE(
     owner              IN VARCHAR2,
     change_table_name  IN VARCHAR2,
     force_flag         IN CHAR);
```

Parameters

Table 21–22 DROP_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Name of the schema that owns the change table.
change_table_name	Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.
force_flag	Drops the change table, depending on whether or not there are subscriptions to it, as follows: ■ 'Y': Drops the change table even if there are subscriptions to it. ■ 'N': Drops the change table only if there are no subscriptions to it.

Exceptions

Table 21–23 DROP_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31424	Change table has active subscriptions
ORA-31441	Table is not a change table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the DROP_CHANGE_TABLE procedure using the force_flag => 'Y' parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.

DROP_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
     subscription_name  IN VARCHAR2);
```

Parameters

Table 21–24 DROP_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	Name of the subscription that was specified by a previous call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 21–25 DROP_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31432	Invalid source table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. Ideally, subscribers drop subscriptions that are no longer needed using the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure and the publisher need not use the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.

PURGE Procedure

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

Syntax

```
DBMS_CDC_PUBLISH.PURGE;
```

Exceptions

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
  - The publisher can run this procedure manually from the command line to purge data from change tables.
  - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the `DBMS_CDC_PUBLISH.PURGE` procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE` procedure physically removes unneeded rows from change tables. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET(
 change_set_name IN VARCHAR2);
```

Parameters

Table 21–26 PURGE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.

Exceptions

Table 21–27 PURGE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Change set is not an existing change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_TABLE Procedure

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE(
     owner              IN VARCHAR2,
     change_table_name  IN VARCHAR2);
```

Parameters

Table 21–28 PURGE_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the named change table.
change_table_name	Name of an existing change table. Change table names follow the Oracle schema object naming rules.

Exceptions

Table 21–29 PURGE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure physically removes unneeded rows from the specified change table. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

22

DBMS_CDC_SUBSCRIBE

The DBMS_CDC_SUBSCRIBE package, one of a set of Change Data Capture packages, lets subscribers view and query change data that was captured and published with the DBMS_CDC_PUBLISH package.

A Change Data Capture system usually has one publisher and many subscribers. The **subscribers** (applications or individuals), use the Oracle supplied package, DBMS_CDC_SUBSCRIBE, to access published data.

Note: In previous releases, this package was named DBMS_LOGMNR_CDC_SUBSCRIBE. Beginning with Oracle Database 10*g*, the LOGMNR string has been removed from the name, resulting in the name DBMS_CDC_SUBSCRIBE. Although both variants of the name are still supported, the variant with the LOGMNR string has been deprecated and may not be supported in a future release.

See Also: *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture.

This chapter contains the following topics:

Using DBMS_CDC_SUBSCRIBE

This section contains the following topics, which relate to using the `DBMS_CDC_SUBSCRIBE` package:

Overview

The primary role of the subscriber is to use the change data. Through the DBMS_CDC_SUBSCRIBE package, each subscriber registers interest in source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the subprograms in the DBMS_CDC_SUBSCRIBE package, the subscriber accomplishes the following main objectives:

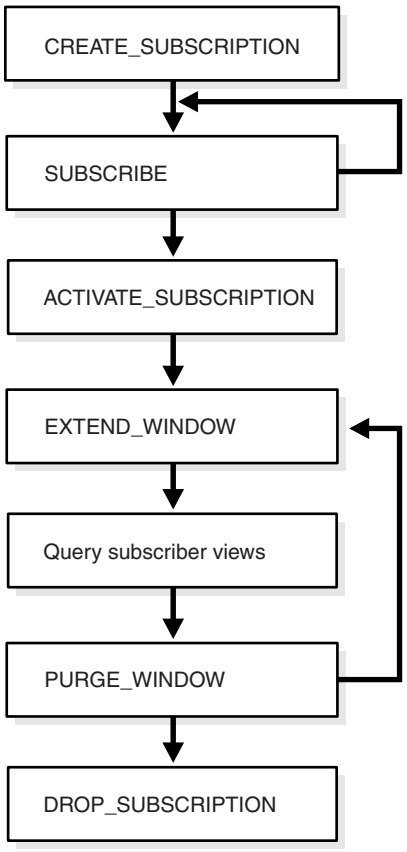
1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL SELECT statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 22–1 provides a graphical flowchart of the order in which subscribers most typically use the subprograms in the DBMS_CDC_SUBSCRIBE package (which are listed in Table 22–1). A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.

Note: If a subscriber uses the PURGE_WINDOW procedure immediately after using an EXTEND_WINDOW procedure, then change data may be lost without ever being processed.

See Also: Chapter 21, "DBMS_CDC_PUBLISH" for information on the package for publishing change data.

Figure 22–1 Subscription Flow



Deprecated Subprograms

> **Note:** Oracle Corporation recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10*g*:

- `DROP_SUBSCRIBER_VIEW`

  Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.

- `GET_SUBSCRIPTION_HANDLE`

  Subscribers no longer explicitly specify subscription handles. Subscribers should use the `CREATE_SUBSCRIPTION` procedure instead to specify a subscription name.

- `PREPARE_SUBSCRIBER_VIEW`

  Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.

Changes in Behavior

If an existing application uses these deprecated `DBMS_CDC_SUBSCRIBE` subprograms with Oracle Database 10*g*, note the following changes in behavior:

- Subscriber views are persistent for the life of the subscription.
- Some error conditions, particularly with regard to subscriber view management, no longer occur.
- If a publisher alters a publication such that it contains different control columns, the subscriber must call `DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW` to see the new column structure.

Deprecated Parameters

The use of the `subscription_handle` parameter with the following `DBMS_CDC_SUBSCRIBE` procedures has been deprecated beginning with Oracle Database 10*g*:

- `SUBSCRIBE`
- `ACTIVATE_SUBSCRIPTION`
- `EXTEND_WINDOW`
- `PURGE_WINDOW`
- `DROP_SUBSCRIPTION`

Security Model

Change Data Capture grants `EXECUTE` privileges to `PUBLIC` on the `DBMS_CDC_SUBSCRIBE` package.

Views

The DBMS_CDC_SUBSCRIBE package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_SUBSCRIBE Subprograms

Table 22–1 DBMS_CDC_SUBSCRIBE Package Subprograms

Subprogram	Description
ACTIVATE_SUBSCRIPTION Procedure on page 22-9	Indicates that a subscription is ready to start accessing change data
CREATE_SUBSCRIPTION Procedure on page 22-10	Creates a subscription and associates it with one change set
DROP_SUBSCRIPTION Procedure on page 22-12	Drops a subscription that was created with a prior call to the `CREATE_SUBSCRIPTION` procedure
EXTEND_WINDOW Procedure on page 22-13	Sets a subscription window high boundary so that new change data can be seen
PURGE_WINDOW Procedure on page 22-14	Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data
SUBSCRIBE Procedure on page 22-15	Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table

ACTIVATE_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION (
     subscription_name  IN VARCHAR2);
```

Parameters

Table 22–2 ACTIVATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–3 ACTIVATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The ACTIVATE_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.
- Once the subscriber activates the subscription:
  - No additional source tables can be added to the subscription.
  - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
  - The subscriber must use the EXTEND_WINDOW procedure to see the initial set of change data.
  - The subscription cannot be activated again.
- A subscription cannot be activated if the underlying change set has reached its end_date parameter value.

CREATE_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated GET_SUBSCRIPTION_HANDLE procedure.

Syntax

```
DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION (
     change_set_name      IN  VARCHAR2,
     description          IN  VARCHAR2,
     subscription_name    IN  VARCHAR2);
```

Parameters

Table 22–4 CREATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
change_set_name	The name of an existing change set to which the subscriber subscribes
description	A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.
subscription_name	A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of CDC$. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–5 CREATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31449	Invalid value for change_set_name
ORA-31457	Maximum length of description field exceeded
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31506	Duplicate subscription name specified
ORA-31510	Name uses reserved prefix CDC$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The CREATE_SUBSCRIPTION procedure allows a subscriber to register interest in a change set associated with source tables of interest.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.
- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber's login ID.

- Subscriptions cannot be created if the underlying change set has reached its `end_date` parameter value.

DROP_SUBSCRIPTION Procedure

This procedure drops a subscription.

Syntax

```
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION (
     subscription_name  IN VARCHAR2);
```

Parameters

Table 22–6 DROP_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–7 DROP_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist

Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.

EXTEND_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

Syntax

```
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW (
     subscription_name  IN VARCHAR2);
```

Parameters

Table 22–8 EXTEND_WINDOW Procedure Parameters

Parameter	Description
subscription_name	The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–9 EXTEND_WINDOW Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31509	Publication does not exist
ORA-31514	Change set disabled due to capture error

Usage Notes

- Until the subscriber calls the EXTEND_WINDOW procedure to begin receiving change data, the subscription window remains empty.
  - The first time that the subscriber calls the EXTEND_WINDOW procedure, it establishes the initial boundaries for the subscription window.
  - Subsequent calls to the EXTEND_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.
- Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS_CDC_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND_WINDOW procedure.
- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the EXTEND_WINDOW procedure will not raise the high boundary.

PURGE_WINDOW Procedure

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW (
     subscription_name   IN VARCHAR2);
```

Parameters

Table 22–10 PURGE_WINDOW Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 22–11 PURGE_WINDOW Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE_WINDOW procedure. By this action, the subscriber performs the following functions:
  - Informs Change Data Capture that the subscriber is finished with the current set of change data.
  - Enables Change Data Capture to remove change data that is no longer needed by any subscribers.

  Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.
- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the PURGE_WINDOW procedure will not move the low boundary.

SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

Syntax

There are two versions of syntax for the SUBSCRIBE procedure, as follow:

- Using source schema and source table

  When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified source_table and column_list. If such a publication cannot be found, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
     subscription_name    IN VARCHAR2,
     source_schema        IN VARCHAR2,
     source_table         IN VARCHAR2,
     column_list          IN VARCHAR2,
     subscriber_view      IN VARCHAR2);
```

- Using publication IDs

  When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the column_list parameter are not in the identified change table, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
   subscription_name    IN VARCHAR2,
   publication_id       IN NUMBER,
   column_list          IN VARCHAR2,
   subscriber_view      IN VARCHAR2);
```

Parameters

Table 22–12 SUBSCRIBE Procedure Parameters

Parameter	Description
subscription_name	The name of a subscription that was specified for, or returned by, a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
source_schema	The name of the schema where the source table resides
source_table	The name of a published source table
column_list	A comma-delimited list of columns from the published source table or publication
subscriber_view	Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of CDC$. Subscriber view names follow the Oracle schema object naming rules.
publication_id	A valid publication_id, which the subscriber can obtain from the ALL_PUBLISHED_COLUMNS view.

Exceptions

Table 22–13 SUBSCRIBE Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31427	Specified source table already subscribed
ORA-31428	No publication contains all the specified columns
ORA-31432	Invalid source table
ORA-31466	No publications found
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31510	Name uses reserved prefix CDC$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The SUBSCRIBE procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the SUBSCRIBE procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the SUBSCRIBE procedure to include multiple source tables or publications IDs in a subscription.
- If the columns of interest are all in a single publication, the subscriber can call the SUBSCRIBE procedure using the source_schema and source_table parameters or using the publication_id parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the SUBSCRIBE procedure using the publication_id parameter.
- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the ALL_PUBLISHED_COLUMNS view.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source table columns accessible to the subscriber.
- Subscriptions must be created before a subscriber calls the SUBSCRIBE procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.
- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the SUBSCRIBE procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.
- All specified source tables or publications must be in the change set that is associated with the named subscription.
- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.
- A subscriber cannot subscribe to a publication within a change set that has reached its `end_date` parameter value.

23

DBMS_CHANGE_NOTIFICATION

The DBMS_CHANGE_NOTIFICATION package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

> **See Also:** *Oracle Database Application Developer's Guide - Fundamentals* regarding implementing database change notification.

This chapter contains the following topics:

Using DBMS_CHANGE_NOTIFICATION

Overview

The DBMS_CHANGE_NOTIFICATION package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. When a transaction changes any of the objects associated with the registered queries and COMMITs, this invokes the PL/SQL callback specified during registration. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a BEGIN-END block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by ENDing the registration block.

The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

Security Model

The DBMS_CHANGE_NOTIFICATION package requires that the user have the CHANGE NOTIFICATION system privilege in order to receive notifications, and be granted EXECUTE privilege on the DBMS_CHANGE_NOTIFICATION package.

In addition the user is required to have SELECT privileges on all objects to be registered. Note that if the SELECT privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

Constants

The DBMS_CHANGE_NOTIFICATION package uses the constants shown in Table 23–1. The constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CHANGE_NOTIFCATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDs describe registration Quality of Service properties that the client requires. These are specified during registration.

Table 23–1 DBMS_CHANGE_NOTIFICATION Constants

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS BINARY_ INTEGER	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running RAC
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows

Operational Notes

- The notifications are published by the database when a transaction changes the registered objects and COMMITs.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the job_queue_processes parameter set to a non-zero value? This parameter needs to be configured to a non-zero value in order to receive PL/SQL notifications via the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you COMMITing the transaction? Please note that the notifications are transactional and will be generated when the transaction COMMITs.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named <ORACLE_SID>_j*_<PID>.trc. '

  For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.

  Suppose a registration is created with 'chnf_callback as the notification handler and with registration_id 100. Let us suppose the user forgets to define the chnf_callback procedure. Then the JOBQ trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
   Error in PLSQL notification of msgid:
   Queue :
   Consumer Name :
   PLSQL function :chnf_callback
   Exception Occured, Error msg:
   ORA-00604: error occurred at recursive SQL level 2
   ORA-06550: line 1, column 7:
   PLS-00201: identifier 'CHNF_CALLBACK' must be declared
   ORA-06550: line 1, column 7:
   PL/SQL: Statement ignored
```

  See Also: For more information about troubleshooting Database Change Notification, see *Oracle Database Application Developer's Guide - Fundamentals*.

Examples

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS_CHANGE_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT / AS SYSDBA;
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CHANGE_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr/hr;
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                            table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                          row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
   regid           NUMBER;
   tbname          VARCHAR2(60);
   event_type      NUMBER;
   numtables       NUMBER;
   operation_type  NUMBER;
   numrows         NUMBER;
   row_id          VARCHAR2(20);
 BEGIN
     regid      := ntfnds.registration_id;
     numtables  := ntfnds.numtables;
     event_type := ntfnds.event_type;

  INSERT INTO nfevents VALUES(regid, event_type);
  IF (event_type = DBMS_CHANGE_NOTIFICATION.EVENT_OBJCHANGE) THEN
    FOR i IN 1..numtables LOOP
      tbname          := ntfnds.table_desc_array(i).table_name;
      operation_type  := ntfnds.table_desc_array(I). Opflags;
      INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
      /* Send the table name and operation_type to client side listener using UTL_
HTTP */
      /* If interested in the rowids, obtain them as follows */
```

```
      IF (bitand(operation_type, DBMS_CHANGE_NOTIFICATION.ALL_ROWS) = 0) THEN
        numrows := ntfnds.table_desc_array(i).numrows;
      ELSE
        numrows :=0;   /* ROWID INFO NOT AVAILABLE */
      END IF;

      /* The body of the loop is not executed when numrows is ZERO */
      FOR j IN 1..numrows LOOP
          Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
          INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
         /* optionally Send out row_ids to client side listener using UTL_HTTP; */
      END LOOP;

    END LOOP;
  END IF;
  COMMIT;
END;
/
```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (`chnf_callback`) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```
Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
  REGDS      SYS.CHNF$_REG_INFO;
  regid      NUMBER;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  qosflags   NUMBER;
BEGIN
 qosflags := DBMS_CHANGE_NOTIFICATION.QOS_RELIABLE +
         DBMS_CHANGE_NOTIFICATION.QOS_ROWIDS;
REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
regid := DBMS_CHANGE_NOTIFICATION.NEW_REG_START (REGDS);
SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
DBMS_CHANGE_NOTIFICATION.REG_END;
END;
/
```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any `COMMIT`ted changes to the `HR.EMPLOYEES` table. As an example, let us assume that the following update is performed on the employees table.

```
UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;
COMMIT;
```

Once the notification is processed, you will find rows which might look like the following in the `nfevents`, `nftablechanges` and `nfrowchanges` tables.

```
SQL> SELECT * FROM nfevents;

     REGID     EVENT_TYPE
---------------------------
     20045          6

SQL> SELECT * FROM nftablechanges;

  REGID      TABLE_NAME         TABLE_OPERATION
```

```
-----------------------------------------
  20045      HR.EMPLOYEES            4

SQL> select * from nfrowchanges;

    REGID      TABLE_NAME          ROW_ID
-----------------------------------------------------
    20045     HR.EMPLOYEES    AAAKB/AABAAAJ8zAAF
```

Notes

1. In the above example, a registration was created on the EMPLOYEES table with 'chnf_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS_RELIABLE) and rowid notifications (QOS_ROWIDS)
2. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be accessed.
3. The handler accesses the row descriptor array from the table notification descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the ALL_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

   This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1 % of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

   Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL_HTTP. The listener could then refresh its cache by querying from the back-end database.

Data Structures

The DBMS_CHANGE_NOTIFICATION package uses the following OBJECT types.

OBJECT Types

- SYS.CHNF$_DESC Object Type
- SYS.CHNF$_TDESC Object Type
- SYS.CHNF$_TDESC_ARRAY Object (Array) Type
- SYS.CHNF$_RDESC Object Type
- SYS.CHNF$_RDESC_ARRAY Object (Array) Type
- SYS.CHNF$_REG_INFO Object Type

SYS.CHNF$_DESC Object Type

This is the top level change notification descriptor type.

Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
   registration_id    NUMBER,
   transaction_id     RAW(8),
   dbname             VARCHAR2(30),
   event_type         NUMBER,
   numtables          NUMBER,
   table_desc_array   CHNF$_TDESC_ARRAY)
```

Attributes

Table 23–2 SYS.CHNF$_DESC Object Type

Attribute	Description
registration_id	Registration ID returned during registration
transaction_id	Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE
dbname	Name of database
event_type	Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)
numtables	Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.
table_desc_array	Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.

SYS.CHNF$_TDESC Object Type

This object type is the table descriptor that contains an array of row descriptors.

Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT OF (
   opflags         NUMBER,
   table_name      VARCHAR2(64),
   numrows         NUMBER,
   row_desc_array  CHNF$_RDESC_ARRAY);
```

Attributes

Table 23–3 TYPE SYS.CHNF$_TDESC Object Type

Attribute	Description
opflags	Table level operation flags. This is a flag field (bit-vector) which describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
table_name	Name of modified table
numrows	Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.
row_desc_array	Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.

SYS.CHNF$_TDESC_ARRAY Object (Array) Type

This object is the table descriptor type that describes the operations that occurred on a registered table.

Syntax

```
TYPE SYS.CHNF$_TDESC_ARRAY IS VARRAY (1024) OF CHNF$_TDESC;
```

SYS.CHNF$_RDESC Object Type

This object type is the notification descriptor received as an argument of the server side PL/SQL procedure which contains the details of the invalidation. This object type describes modifications to an individual row within a changed table.

An array of CHNF$_RDESC is embedded inside a CHNF$_TDESC (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT OF (
   opflags     NUMBER,
   row_id      VARCHAR2(2000));
```

Attributes

Table 23–4 TYPE SYS.CHNF$_RDESC Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

SYS.CHNF$_RDESC_ARRAY Object (Array) Type

This object type corresponds to an array of row change notification descriptors and is embedded inside the table change descriptor (CHNF$_TDESC) if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Syntax

```
TYPE SYS.CHNF$_RDESC_ARRAY IS VARRAY (1024) OF CHNF$_RDESC;
```

SYS.CHNF$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                       VARCHAR2(20),
  quosflags                      NUMBER,
  timeout                        NUMBER,
  operations_filter              NUMBER,
  transaction_lag                NUMBER);
```

Attributes

Table 23–5 TYPE SYS.CHNF$_REG_INFO Object Type

Attribute	Description
`callback`	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is `<call_backname>(ntfnds IN SYS.chnf$_desc)`
`qosflags`	Quality of service flags. Can be set to an `OR` of `QOS_RELIABLE` / `QOS_DEREG_NFY` / `QOS_ROWIDS`: ▪ `0x1` (`QOS_RELIABLE`): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in a RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown. ▪ `0x2` (`QOS_DEREG_NFY`): The registration will be expunged on the first notification ▪ `0x4` (`QOS_ROWIDS`): The notification needs to include information about the rowids that were modified
`timeout`	If set to a non-zero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / `NULL`, the registration lives until explicitly deregistered. Note that the `timeout` option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.

Table 23–5 (Cont.) TYPE SYS.CHNF$_REG_INFO Object Type

Attribute	Description
operations_filter	if non-zero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types: ■ 0: Notify on all operations (DBMS_CHANGE_NOTIFICATION.ALL_OPERATIONS) ■ 0x2: Notify on every INSERT (DBMS_CHANGE_NOTIFICATION.INSERTOP) ■ 0x4: Notify on every UPDATE (DBMS_CHANGE_NOTIFICATION.UPDATEOP) ■ 0x8: Notify on every DELETE (DBMS_CHANGE_NOTIFICATION.DELETEOP) A combination of operations can be specified by using a bitwise OR.
transaction_lag	Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated

Usage Notes

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format schema_name.procedure_name. The procedure must have the following signature:

  ```
  PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
  ```

  CHNF$_DESC describes the change notification descriptor.

- The init.ora parameter job_queue_processes must be set to a non-zero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

Summary of DBMS_CHANGE_NOTIFICATION Subprograms

Table 23–6 DBMS_CHANGE_NOTIFICATION Package Subprograms

Subprogram	Description
DEREGISTER Procedure on page 23-19	De-subscribes the client with the supplied registration identifier (ID)
ENABLE_REG Procedure on page 23-20	Begins a registration block using an existing registration identifier (ID)
NEW_REG_START Function on page 23-21	Begins a new registration block
REG_END Procedure on page 23-22	Ends the registration boundary

DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CHANGE_NOTIFICATION.DEREGISTER (
  regid IN NUMBER);
```

Parameters

Table 23–7 DEREGISTER Procedure Parameters

Parameter	Description
regid	Client registration ID

Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.

ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). This subprogram is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.

Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the REG_END Procedure.

Syntax

```
DBMS_CHANGE_NOTIFICATION.ENABLE_REG (
  regid IN NUMBER);
```

Parameters

Table 23–8 ENABLE_REG Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

```
DBMS_CHANGE_NOTIFICATION.NEW_REG_START (
  regds IN sys.chnf$_reg_info)
 RETURN NUMBER;
```

Parameters

Table 23–9 NEW_REG_START Function Parameters

Parameter	Description
sys.chnf$_reg_info	Registration descriptor describing the notification handler and other properties of the registration

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE NOTIFICATION system privilege and SELECT privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CHANGE_NOTIFICATION.REG_END;
```

24

DBMS_CRYPTO

DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

> **See Also:** *Oracle Database Security Guide* for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

Using the DBMS_CRYPTO Subprograms

Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 24–1 lists the DBMS_CRYPTO package features in comparison to the other PL/SQL encryption package, the DBMS_OBFUSCATION_TOOLKIT.

Table 24–1 DBMS_CRYPTO and DBMS_OBFUSCATION_TOOLKIT Feature Comparison

Package Feature	DBMS_CRYPTO	DBMS_OBFUSCATION_TOOLKIT
Cryptographic algorithms	DES, 3DES, AES, RC4, 3DES_2KEY	DES, 3DES
Padding forms	PKCS5, zeroes	none supported
Block cipher chaining modes	CBC, CFB, ECB, OFB	CBC
Cryptographic hash algorithms	MD5, SHA-1, MD4	MD5
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1	none supported
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER	RAW, VARCHAR2
Database types	RAW, CLOB, BLOB	RAW, VARCHAR2

DBMS_CRYPTO is intended to replace the DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.

Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

Types

Parameters for the DBMS_CRYPTO subprograms use these datatypes:

Table 24–2 DBMS_CRYPTO Datatypes

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

Algorithms

The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

Table 24–3 DBMS_CRYPTO Cryptographic Hash Functions

Name	Description
HASH_MD4	Produces a 128-bit hash, or message digest of the input message
HASH_MD5	Also produces a 128-bit hash, but is more complex than MD4
HASH_SH1	Secure Hash Algorithm (SHA). Produces a 160-bit hash.

Table 24–4 DBMS_CRYPTO MAC (Message Authentication Code) Functions

Name	Description
HMAC_MD5[1]	Same as MD5 hash function, except it requires a secret key to verify the hash value.
HMAC_SH1[1]	Same as SHA hash function, except it requires a secret key to verify the hash value.

[1] Complies with IETF RFC 2104 standard

Table 24–5 DBMS_CRYPTO Encryption Algorithms

Name	Description
ENCRYPT_DES	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
ENCRYPT_RC4	Stream cipher. Uses a secret, randomly generated key unique to each session.

Table 24–6 DBMS_CRYPTO Block Cipher Suites

Name	Description
DES_CBC_PKCS5	ENCRYPT_DES[1] + CHAIN_CBC[2]+ PAD_PKCS5[3]
DES3_CBC_PKCS5	ENCRYPT_3DES[1] + CHAIN_CBC[2] + PAD_PKCS5[3]

[1] See Table 24–5, " DBMS_CRYPTO Encryption Algorithms"
[2] See Table 24–7, " DBMS_CRYPTO Block Cipher Chaining Modifiers"
[3] See Table 24–8, " DBMS_CRYPTO Block Cipher Padding Modifiers"

Table 24–7 DBMS_CRYPTO Block Cipher Chaining Modifiers

Name	Description
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that *n* bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.

Table 24–8 DBMS_CRYPTO Block Cipher Padding Modifiers

Name	Description
PAD_PKCS5	Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ZERO	Provides padding consisting of zeroes.

Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype. After performing these conversions, you can then encrypt it with the DBMS_CRYPTO package.

> **See Also:** "Conversion Rules" on page 24-11 for information about converting datatypes.

Exceptions

Table 24–9 lists exceptions that have been defined for DBMS_CRYPTO.

Table 24–9 DBMS_CRYPTO Exceptions

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

Operational Notes

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt `LOB` datatypes (overloaded for `CLOB` and `BLOB` datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt `RAW` datatypes. Data of type `VARCHAR2` must be converted to `RAW` before you can use `DBMS_CRYPTO` functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs `DBMS_CRYPTO.HASH` against the stored data to create a hash value. When she retrieves the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can use to generate a hash value from either `RAW` or `LOB` data. The `MAC` function is also a one-way hash function, but with the addition of a secret key. It works the same way as the `DBMS_CRYPTO.HASH` function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by `DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys. (Calls to the RANDOMBYTES function behave like calls to the DESGETKEY and DES3GETKEY functions of the DBMS_OBFUSCATION_TOOLKIT package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:

- *Oracle Database Advanced Security Administrator's Guide* for information about configuring network encryption and SSL.
- "Key Management" on page 62-5 for a full discussion about securely storing encryption keys
- "RANDOMBYTES Function" on page 24-20

Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:

  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

  Syntax example:

  ```
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:

  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

  Syntax example:

  ```
  UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
  ```

  See Also: Chapter 169, "UTL_I18N" for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

Examples

The following listing shows PL/SQL block encrypting and decrypting pre-defined '`input_string`' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
   input_string       VARCHAR2 (200) :=  'Secret Message';
   output_string      VARCHAR2 (200);
   encrypted_raw      RAW (2000);             -- stores encrypted binary text
   decrypted_raw      RAW (2000);             -- stores decrypted binary text
   num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
   key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
   encryption_type    PLS_INTEGER :=          -- total encryption type
                         DBMS_CRYPTO.ENCRYPT_AES256
                       + DBMS_CRYPTO.CHAIN_CBC
                       + DBMS_CRYPTO.PAD_PKCS5;
BEGIN
   DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
   key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
   encrypted_raw := DBMS_CRYPTO.ENCRYPT
      (
         src => UTL_I18N.STRING_TO_RAW (input_string,  'AL32UTF8'),
         typ => encryption_type,
         key => key_bytes_raw
      );
    -- The encrypted value "encrypted_raw" can be used here

   decrypted_raw := DBMS_CRYPTO.DECRYPT
      (
         src => encrypted_raw,
         typ => encryption_type,
         key => key_bytes_raw
      );
   output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

   DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

Summary of DBMS_CRYPTO Subprograms

Table 24–10 DBMS_CRYPTO Package Subprograms

Subprogram	Description
DECRYPT Function on page 24-14	Decrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
DECRYPT Procedures on page 24-15	Decrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Function on page 24-16	Encrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Procedures on page 24-17	Encrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
HASH Function on page 24-18	Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data
MAC Function on page 24-19	Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection
RANDOMBYTES Function on page 24-20	Returns a `RAW` value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
RANDOMINTEGER Function on page 24-21	Returns a random `BINARY_INTEGER`
RANDOMNUMBER Function on page 24-22	Returns a random 128-bit integer of the `NUMBER` datatype

DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW          DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 24–11 DECRYPT Function Parameters

Parameter Name	Description
src	RAW data to be decrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

  See Also: "Usage Notes" for the ENCRYPT function on page 24-16 for additional information about the ciphers and modifiers available with this package.

- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

  See Also: "Conversion Rules" on page 24-11 for a discussion of the VARCHAR2 to RAW conversion process.

DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPT.DECRYPT(
   dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 24–12 DECRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.

ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW          DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 24–13 ENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 24–7 and Table 24–8 on page 24-7 for block cipher chaining and padding modifier constants that have been defined for this package.
- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

  ```
  DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                     + DBMS_CRYPTO.CHAIN_CBC
                                     + DBMS_CRYPTO.PAD_NONE;
  ```

  See Table 24–6 on page 24-6 for the block cipher suites already defined as constants for this package.
- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

  See Also: "Conversion Rules" on page 24-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            CLOB         CHARACTER SET ANY_CS,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 24–14 ENCRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

See "Conversion Rules" on page 24-11 for usage notes about using the ENCRYPT procedure.

HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 24-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 24–3 on page 24-6.

Syntax

```
DBMS_CRYPTO.Hash (
   src IN RAW,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN BLOB,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 24–15 HASH Function Parameters

Parameter Name	Description
`src`	The source data to be hashed.
`typ`	The hash algorithm to be used.

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, `HASH_SH1`, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "HASH Function" on page 24-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 24-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See Table 24–4 on page 24-6 for a list of MAC algorithms that have been defined for this package.

Syntax

```
DBMS_CRYPTO.MAC (
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN BLOB,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 24–16 MAC Function Parameters

Parameter Name	Description
src	Source data to which MAC algorithms are to be applied.
typ	MAC algorithm to be used.
key	Key to be used for MAC algorithm.

RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator), and it draws its entropy (seed) from the sqlnet.ora file parameter SQLNET.CRYPTO_SEED.

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
   number_bytes IN POSITIVE)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 24–17 RANDOMBYTES Function Parameter

Parameter Name	Description
number_bytes	The number of pseudo-random bytes to be generated.

Usage Note

- The number_bytes value should not exceed the maximum length of a RAW variable.
- The SQLNET.CRYPTO_SEED parameter can be set by entering 10 to 70 random characters with the following syntax in the sqlnet.ora file:

  ```
  SQLNET.CRYPTO_SEED = <10 to 70 random characters>
  ```

  See Also: *Oracle Database Advanced Security Administrator's Guide* for more information about the SQLNET.CRYPTO_SEED parameter and its use.

RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle `BINARY_INTEGER` datatype.

Syntax

```
DBMS_CRYPTO.RANDOMINTEGER
 RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
```

RANDOMNUMBER Function

This function returns an integer in the Oracle `NUMBER` datatype in the range of [0..2**128-1].

Syntax

```
DBMS_CRYPTO.RANDOMNUMBER
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
```

25

DBMS_DATA_MINING

Oracle Data Mining (ODM) is designed for programmers, systems analysts, project managers, and others who develop data mining applications. Data mining discovers hidden patterns within the data and uses that knowledge to make predictions and summaries.

The `DBMS_DATA_MINING` package is an interface to ODM. With `DBMS_DATA_MINING`, you can build a mining model, test the model, and apply the model to your data.

See Also:

- Chapter 26, "DBMS_DATA_MINING_TRANSFORM". This package supports data pre-processing for data mining.
- Chapter 72, "DBMS_PREDICTIVE_ANALYTICS". This package automates the entire process of predictive data mining, from data preprocessing through model building to scoring new data.
- *Oracle Database SQL Reference* for information about the SQL scoring functions for data mining.
- *Oracle Data Mining Administrator's Guide* for information about sample data mining programs.
- *Oracle Data Mining Application Developer's Guide* for information about developing data mining applications in SQL and Java.

This chapter contains the following topics:

Using DBMS_DATA_MINING

This section contains topics which relate to using the `DBMS_DATA_MINING` package.

Overview

Oracle Data Mining (ODM) embeds data mining functionality in the Oracle Database. The data never leaves the database — the data, its preparation, model building, and model scoring (applying) all remain in the database. This enables Oracle to provide an infrastructure for data analysts and application developers to integrate data mining seamlessly with database applications.

Oracle Data Mining Concepts

ODM supports both predictive and descriptive data mining. Predictive data mining uses an historical model to predict a target value. Descriptive data mining identifies natural groupings within a given data set.

Predictive data mining functions include:

- Classification
- Regression
- Attribute Importance

Descriptive data mining functions include:

- Clustering
- Association
- Feature Extraction

The steps you use to build and score a model depend on the data mining function and the algorithm being used. To learn more about ODM functions and algorithms, refer to *Oracle Data Mining Concepts*.

Oracle Data Mining APIs

ODM provides a graphical user interface (Oracle Data Miner), as well as application programming interfaces for SQL and Java. The SQL interface consists of PL/SQL packages and SQL functions. The Java interface is an Oracle implementation of the JDM 1.0 standard for data mining. The SQL and Java APIs are fully interoperable.

The SQL functions for data mining, new in 10*g* Release 2 (10.2), return the results of model scoring. These functions apply pre-existing models within the context of a SQL statement. The ODM scoring functions include: `CLUSTER_ID`, `CLUSTER_PROBABILITY`, `CLUSTER_SET`, `FEATURE_ID`, `FEATURE_SET`, `FEATURE_VALUE`, `PREDICTION`, `PREDICTION_COST`, `PREDICTION_DETAILS`, `PREDICTION_PROBABILITY`, `PREDICTION_SET`. The ODM scoring functions are documented in *Oracle Database SQL Reference*.

The `DBMS_DATA_MINING` package supports the process of building, testing, and scoring models for all ODM mining functions. Most mining data requires preprocessing before mining activities can begin. For this, you can use the `DBMS_DATA_MINING_TRANSFORM` package or third-party utilities. To automate the entire process of predictive data mining, use the `DBMS_PREDICTIVE_ANALYTICS` package.

> **See Also:** Sample data mining programs are available with Oracle Data Mining. Instructions for using the sample programs are provided in the *Oracle Data Mining Administrator's Guide*. Additional information about the Oracle Data Mining interfaces is available in the *Oracle Data Mining Application Developer's Guide*.

New Functionality

In Oracle Database 10*g* Release 2, the `DBMS_DATA_MINING` package includes the following new functionality:

- Decision Tree algorithm for classification
- Orthogonal Partitioning Clustering (O-Cluster) algorithm for clustering
- One-Class Support Vector Machine, which supports Anomaly Detection
- Active learning for Support Vector Machine

For detailed information about new features in Oracle Data Mining, see *Oracle Data Mining Concepts* and *Oracle Database New Features*

Model Names

The names of ODM models must be valid schema object names. However, the naming rules for models are more restrictive than the naming rules for schema objects. A model name must satisfy the following additional requirements:

- It must be 25 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in *Oracle Database SQL Reference*.

Constants

Oracle Data Mining uses constants to specify the mining function, its algorithm, and other details about a model. The function, or type, of a model is specified when the model is created. Non-default characteristics of the model are specified in a settings table associated with the model.

The settings table is a user-created table with the following columns:

```
(setting_name        VARCHAR2(30),
 setting_value       VARCHAR2(128))
```

Each setting in the `setting_name` column is a constant, and many of the values that can be specified in the `setting_value` column are also constants. Numeric values are implicitly converted to `VARCHAR2`. To explicitly convert them, use the `TOCHAR` function.

> **See Also:** *Oracle Data Mining Application Developer's Guide* for information about creating a settings table, and for default setting values and ranges.

Constants that Specify the Mining Function

Oracle Data Mining supports a number of predictive and descriptive mining functions. The mining function is specified as a parameter to the `CREATE_MODEL` procedure. See "CREATE_MODEL Procedure" on page 25-30 for more information.

The `mining_function` parameter has a `VARCHAR2(30)` data type; it can have the values listed in Table 25–1.

Table 25–1 Mining Functions

Constant	Description
`association`	Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set.
`attribute_importance`	Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome.
`classification`	Classification is a predictive mining function. A classification model uses historical data to predict new discrete or categorical data. The `classification` function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).
`clustering`	Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set.
`feature_extraction`	Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model.
`regression`	Regression is a predictive mining function. A regression model uses historical data to predict new continuous, numerical data.

Constants that Specify Information About Mining Functions

Every model is based on one of the mining functions described in Table 25–1. You can configure the mining function with the settings described in Table 25–2.

Table 25–2 Mining Function Settings

Constant	Description
`algo_name`	Setting that specifies the algorithm used by the model. The following constants can be values for this setting:
`algo_adaptive_bayes_network`	Adaptive Bayes Network (ABN), the default algorithm for classification.
`algo_ai_mdl`	Minimum Description Length (MDL) algorithm for attribute importance.
`algo_apriori_association_rules`	Apriori algorithm for association.
`algo_decision_tree`	Decision Tree (DT) algorithm for classification.
`algo_kmeans`	*k*-Means (KM), the default algorithm for clustering.
`algo_naive_bayes`	Naive Bayes (NB) algorithm for classification.
`algo_nonnegative_matrix_factor`	Non-Negative Matrix Factorization (NMF) algorithm for feature selection.
`algo_o_cluster`	O-Cluster (OC) algorithm for clustering.
`algo_support_vector_machines`	Support Vector Machine (SVM) algorithm for classification or regression.
	One-Class SVM, used for anomaly detection, is SVM classification with a null target.
`asso_max_rule_length`	Setting that specifies the maximum length of a rule used by an association model.
`asso_min_confidence`	Setting that specifies the minimum confidence for an association model.
`asso_min_support`	Setting that specifies the minimum support for an association model.
`clas_cost_table_name`	Setting that specifies the name of the cost matrix table for a classification model.
`clas_priors_table_name`	Setting that specifies the name of the prior probability table for NB and ABN models. Decision Tree is the only classification algorithm that does not use priors.
	For SVM classification models, this setting specifies the name of a table of weights.
`clus_num_clusters`	Setting that specifies the number of clusters for a clustering model.
`feat_num_features`	Setting that specifies the number of features for a feature selection model.

Constants that Specify Information About Algorithms

The algorithm used by a model is specified by the `algo_name` setting (described in Table 25–2). You can configure the algorithm with the settings described in Table 25–3.

Table 25–3 Algorithm Settings

Algorithm	Constant	Description
ABN	abns_max_build_minutes	Setting that specifies the maximum time threshold to complete an ABN model build.
	abns_max_nb_predictors	Setting that specifies the maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type abns_naive_bayes.
	abns_max_predictors	Setting that specifies the maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type abns_single_feature or abns_multi_feature.
	abns_model_type	Setting that specifies the ABN model type. The following constants can be values for this setting:
	abns_multi_feature	Multifeature ABN model.
	abns_naive_bayes	Naive Bayes ABN model.
	abns_single_feature	Single feature ABN model.
DT	tree_impurity_metric	Setting that specifies the tree impurity metric for Decision Tree. The following constants can be values for this setting:
	tree_impurity_entropy	Entropy.
	tree_impurity_gini	Gini.
	tree_term_max_depth	Setting that specifies the maximum tree depth termination criteria for Decision Tree.
	tree_term_minpct_node	Setting name that specifies the minimum percent of records in a parent node termination criteria for Decision Tree.
	tree_term_minpct_split	Setting name that specifies the minimum percent of records in a parent node splitting criteria for Decision Tree.
	tree_term_minrec_node	Setting name that specifies the minimum number of records in a parent node termination criteria for Decision Tree.
	tree_term_minrec_split	Setting that specifies the minimum number of records in a parent node splitting criteria for Decision Tree.
KM	kmns_block_growth	Setting that specifies the growth factor for memory allocated to hold cluster data for *k*-Means.
	kmns_conv_tolerance	Setting that specifies the convergence tolerance for *k*-Means.
	kmns_distance	Setting that specifies the distance function for *k*-Means. The following constants can be values for this setting:
	kmns_cosine	Cosine distance function.
	kmns_euclidean	Euclidean distance function.
	kmns_fast_cosine	Fast cosine distance function.
	kmns_iterations	Setting that specifies the number of iterations for *k*-Means.
	kmns_min_pct_attr_support	Setting that specifies the minimum percentage support required for attributes in rules for *k*-Means clusters.
	kmns_num_bins	Setting that specifies the number of histogram bins *k*-Means.

Table 25–3 (Cont.) Algorithm Settings

Algorithm	Constant	Description
	kmns_split_criterion	Setting that specifies the split criterion for *k*-Means. The following constants can be values for this setting:
	kmns_size	Size as the split criterion.
	kmns_variance	Variance as the split criterion.
NB	nabs_pairwise_threshold	Setting that specifies pair-wise threshold for Naive Bayes.
	nabs_singleton_threshold	Setting that specifies singleton threshold for Naive Bayes.
NMF	nmfs_conv_tolerance	Setting that specifies convergence tolerance for NMF.
	nmfs_num_iterations	Setting that specifies the number of iterations for NMF.
	nmfs_random_seed	Setting that specifies the random seed for NMF.
OC	oclt_max_buffer	Setting that specifies buffer size for O-Cluster.
	oclt_sensitivity	Setting that specifies sensitivity for O-Cluster.
SVM	svms_active_learning	Setting that specifies whether active learning is enabled or disabled. The following constants can be values for this setting:
	svms_al_disable	Active learning is disabled.
	svms_al_enable	Active learning is enabled.
	svms_complexity_factor	Setting that specifies the complexity factor for SVM.
	svms_conv_tolerance	Setting that specifies tolerance for SVM.
	svms_epsilon	Setting that specifies epsilon for SVM Regression.
	svms_kernel_cache_size	Setting that specifies the Gaussian kernel cache size for SVM.
	svms_kernel_function	Setting that specifies the kernel function for SVM. The following constants can be values for this setting:
	svms_gaussian	Gaussian kernel.
	svms_linear	Linear kernel.
	svms_outlier_rate	Setting that specifies the desired rate of outliers in the training data. Valid for One-Class SVM models only.
	svms_std_dev	Setting that specifies standard deviation for SVM Gaussian kernel.

Data Types

The DBMS_DATA_MINING package includes a number of table functions that return algorithm-specific information about models. These functions take a model name as input and return the requested information as a collection of rows. The table functions are named GET_*n*, where *n* identifies the type of information to return. For a list of the ODM GET functions, see "Summary of DBMS_DATA_MINING Subprograms" on page 25-15.

All the GET functions use **pipelining**, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL User's Guide and Reference.*

The virtual table returned by the GET functions is an object data type. Another object data type defines the rows. Some of the columns have object data types that define nested tables.

ODM also uses object data types for handling wide data. These types, DM_NESTED_NUMERICALS and DM_NESTED_CATEGORICALS define nested tables that can be used for storing a set of mining attributes in a single column. For more information on wide data, see the *Oracle Data Mining Application Developer's Guide*.

The ODM object data types are described in Table 25–4.

Table 25–4 DBMS_DATA_MINING Summary of Data Types

Data Type	Purpose
DM_ABN_DETAIL	Represents information about an ABN model.
DM_ABN_DETAILS	Represents a collection of DM_ABN_DETAIL. It is returned by GET_MODEL_DETAILS_ABN.
DM_CENTROID	Represents the centroid of a cluster.
DM_CENTROIDS	Represents a collection of DM_CENTROID. It is returned by GET_MODEL_DETAILS_KM and GET_MODEL_DETAILS_OC.
DM_CHILD	Represents a child node of a cluster.
DM_CHILDREN	Represents a collection of DM_CHILD.
DM_CLUSTER	Represents a cluster.
DM_CLUSTERS	Represents a collection of DM_CLUSTER. It is returned by GET_MODEL_DETAILS_KM and GET_MODEL_DETAILS_OC.
DM_CONDITIONAL	Represents a conditional probability associated with a mining attribute used in an NB or ABN model.
DM_CONDITIONALS	Represents a collection of DM_CONDITIONAL. It is returned by GET_MODEL_DETAILS_NB and GET_MODEL_DETAILS_ABN.
DM_HISTOGRAM_BIN	Represents a histogram associated with a cluster identifier.
DM_HISTOGRAMS	Represents a collection of DM_HISTOGRAM_BIN. It is returned by GET_MODEL_DETAILS_KM.
DM_ITEMS	Represents items.
DM_ITEMSET	Represents a collection of DM_ITEMS.
DM_ITEMSETS	Represents a collection of DM_ITEMSET. These are frequent sets of items in Association models.

Table 25–4 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Purpose
DM_MODEL_SETTING	Represents a setting/value combination from the settings table for the model.
DM_MODEL_SETTINGS	Represents a collection of DM_MODEL_SETTING. It is returned by GET_MODEL_SETTINGS.
DM_MODEL_SIGNATURE_ ATTRIBUTE	Represents an attribute of the model signature.
DM_MODEL_SIGNATURE	Represents a collection of DM_MODEL_SIGNATURE. It is returned by GET_MODEL_SIGNATURE.
DM_NB_DETAIL	Represents information about an NB model.
DM_NB_DETAILS	Represents a collection of DM_DB_DETAIL. It is returned by GET_MODEL_DETAILS_NB.
DM_NESTED_CATEGORICAL	Represents a nested table of categorical attributes.
DM_NESTED_CATEGORICALS	Represents a collection of DM_NESTED_CATEGORICAL. It is used for representing wide data.
DM_NESTED_NUMERICAL	Represents a nested table of numerical attributes.
DM_NESTED_NUMERICALS	Represents a collection of DM_NESTED_NUMERICAL. It is used for representing wide data.
DM_NMF_ATTRIBUTE	Represents a mining attribute for an NMF model.
DM_NMF_ATTRIBUTE_SET	Represents a collection of DM_NMF_ATTRIBUTE. It is returned by GET_MODEL_DETAILS_NMF.
DM_NMF_FEATURE	Represents a feature in an NMF model.
DM_NMF_FEATURE_SET	Represents a collection of DM_NMF_FEATURE. It is returned by GET_MODEL_DETAILS_NMF.
DM_PREDICATE	Represents either the antecedent or the consequent of a rule.
DM_PREDICATES	Represents a collection of DM_PREDICATE.
DM_RANKED_ATTRIBUTE	Represents an entry in the set of attributes ranked by the attribute's importance.
DM_RANKED_ATTRIBUTES	Represents a collection of DM_RANKED_ATTRIBUTE. It is returned by GET_MODEL_DETAILS_AI.
DM_RULE	Represents a model rule.
DM_RULES	Represents a collection of DM_RULE. It is returned by GET_ ASSOCIATION_RULES for *k*-means models, by GET_ MODEL_DETAILS_KM, and by GET_MODEL_DETAILS_OC.
DM_SVM_ATTRIBUTE	Represents an attribute for an SVM model.
DM_SVM_ATTRIBUTE_SET	Represents a collection of DM_SVM_ATTRIBUTE. It is returned by GET_MODEL_DETAILS_SVM for a linear model.
DM_SVM_LINEAR_COEFF	Represents an SVM linear coefficient.
DM_SVM_LINEAR_COEFF_SET	Represents a collection of DM_SVM_LINEAR_COEFF. It is returned by GET_MODEL_DETAILS_SVM for an SVM model built using the linear kernel.

Exceptions

The following table lists the exceptions raised by DBMS_DATA_MINING.

Table 25–5 Exceptions raised by DBMS_DATA_MINING

Oracle Error	Description
ORA-40201	Invalid input parameter %s
ORA-40202	Column %s does not exist in the input table %s
ORA-40203	Model %s does not exist
ORA-40204	Model %s already exists
ORA-40205	Invalid setting name %s
ORA-40206	Invalid setting value for setting name %s
ORA-40207	Duplicate or multiple function settings
ORA-40208	Duplicate or multiple algorithm settings for function %s
ORA-40209	Setting % is invalid for % function
ORA-40211	Algorithm name %s is invalid
ORA-40212	Invalid target data type in input data for %s function
ORA-40213	Contradictory values for settings: %s, %s
ORA-40214	Duplicate setting: %s
ORA-40215	Model %s is incompatible with current operation
ORA-40216	Feature not supported
ORA-40217	Priors table mismatched with training data
ORA-40219	Apply result table %s is incompatible with current operation
ORA-40220	Maximum number of attributes exceeded
ORA-40221	Maximum target cardinality exceeded
ORA-40222	Data mining model export failed, job name=%s, error=%s
ORA-40223	Data mining model import failed, job name=%s, error=%s
ORA-40225	Model is currently in use by another process
ORA-40226	Model upgrade/downgrade must be performed by SYS
ORA-40251	No support vectors were found
ORA-40252	No target values were found
ORA-40253	No target counter examples were found
ORA-40254	Priors cannot be specified for one-class models
ORA-40261	Input data for model build contains negative values
ORA-40262	NMF: number of features not between [1, %s]
ORA-40271	No statistically significant features were found
ORA-40272	Apply rules prohibited for this model mode
ORA-40273	Invalid model type %s for Adaptive Bayes network algorithm
ORA-40281	Invalid model name
ORA-40282	Invalid cost matrix

Table 25–5 (Cont.) Exceptions raised by DBMS_DATA_MINING

Oracle Error	Description
ORA-40283	Missing cost matrix
ORA-40284	Model does not exist
ORA-40285	Label not in the model
ORA-40286	Remote operations not permitted on mining models
ORA-40287	Invalid data for model -- cosine distance out of bounds
ORA-40289	Duplicate attributes provided for data mining function
ORA-40290	Model incompatible with data mining function
ORA-40291	Model cost not available
ORA-40301	Invalid cost matrix specification
ORA-40302	Invalid classname %s in cost matrix specification
ORA-40303	Invalid prior probability specification
ORA-40304	Invalid classname %s in prior probability specification
ORA-40305	Invalid impurity metric specified
ORA-40306	Wide data not supported for decision tree model create
ORA-40321	Invalid bin number, is zero or negative value
ORA-40322	Bin number too large

User Views

Table 25–6 describes the DM_USER_MODELS view, which provides information about the models in the user's schema.

Table 25–6 DM_USER_MODELS

Column	Data Type	NULL	Description
name	VARCHAR2(25)	NOT NULL	Name of the model
function_name	VARCHAR2(30)		The model function. See Table 25–1.
algorithm_name	VARCHAR2(30)		The algorithm used by the model. See Table 25–2.
creation_date	DATE		The date on which the model was created
build_duration	NUMBER		The duration of the model build process
target_attribute	VARCHAR2(30)		The attribute designated as the target of a classification model
model_size	NUMBER		The size of the model in megabytes

Summary of DBMS_DATA_MINING Subprograms

Table 25–7 summarizes the subprograms included in the DBMS_DATA_MINING package.

Table 25–7 DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
APPLY Procedure on page 25-17	Applies a model to a data set (scores the data)
COMPUTE_CONFUSION_MATRIX Procedure on page 25-20	Computes the confusion matrix from the APPLY results on test data for a classification model; also provides the accuracy of the model
COMPUTE_LIFT Procedure on page 25-23	Computes lift for a given positive target value from the APPLY results on test data for a classification model
COMPUTE_ROC Procedure on page 25-26	Computes Receiver Operating Characteristic (ROC) for a classification model
CREATE_MODEL Procedure on page 25-30	Creates (builds) a mining model
DROP_MODEL Procedure on page 25-33	Drops a model
EXPORT_MODEL Procedure on page 25-34	Exports a model into a dump file
GET_ASSOCIATION_RULES Function on page 25-37	Returns the rules from an Association model
GET_DEFAULT_SETTINGS Function on page 25-40	Returns all the default settings for all mining functions and algorithms
GET_FREQUENT_ITEMSETS Function on page 25-41	Returns the frequent itemsets from an Association model
GET_MODEL_DETAILS_ABN Function on page 25-43	Returns the details of an Adaptive Bayes Network model
GET_MODEL_DETAILS_AI Function on page 25-45	Returns the details of an Attribute Importance model
GET_MODEL_DETAILS_KM Function on page 25-46	Returns the details of a *k*-Means model
GET_MODEL_DETAILS_NB Function on page 25-49	Returns the details of a Naive Bayes model
GET_MODEL_DETAILS_NMF Function on page 25-51	Returns the details of an NMF model
GET_MODEL_DETAILS_OC Function on page 25-52	Returns the details of an O-Cluster model
GET_MODEL_DETAILS_SVM Function on page 25-55	Returns the details of a SVM model with a linear kernel
GET_MODEL_DETAILS_XML Function on page 25-57	Returns the details of a decision tree model
GET_MODEL_SETTINGS Function on page 25-58	Returns the settings used to build a model
GET_MODEL_SIGNATURE Function on page 25-59	Returns the signature of a model

Table 25–7 (Cont.) DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
IMPORT_MODEL Procedure on page 25-60	Imports a specified model into a user schema
RANK_APPLY Procedure on page 25-63	Ranks the predictions from the `APPLY` results for a classification model
RENAME_MODEL Procedure on page 25-66	Renames a model

APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the APPLY results in a table. The APPLY operation is also referred to as **scoring**.

For predictive mining functions, the APPLY operation generates predictions in a target column. For descriptive mining functions such as clustering, the APPLY operation assigns each case to a cluster with a probability.

The APPLY operation is not applicable to association models and attribute importance models.

> **Note:** You can use the ODM scoring functions as an alternative to the DBMS_DATA_MINING.APPLY procedure. These SQL functions are documented in the *Oracle Database SQL Reference*. Additional information and code samples are provided in the *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.APPLY (
      model_name           IN VARCHAR2,
      data_table_name      IN VARCHAR2,
      case_id_column_name  IN VARCHAR2,
      result_table_name    IN VARCHAR2,
      data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–8 APPLY Procedure Parameters

Parameter	Description
model_name	Name of the model
data_table_name	Name of table or view representing data to be scored
case_id_column_name	Name of the case identifier column
result_table_name	Name of the table to store apply results
data_schema_name	Name of the schema containing the data to be scored

Usage Notes

The data provided for APPLY should match the data provided to CREATE_MODEL in terms of the schema definition and relevant content. The GET_MODEL_SIGNATURE function provides this information. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must be pre-processed in the same way. The case identifier is not considered to be a mining attribute during APPLY.

You must provide the name of the table in which the results of the apply operation are to be stored. APPLY creates a table with an algorithm-specific fixed schema in the user schema that owns the model.

The behavior of an APPLY operation is analogous to a SQL query operation, even though it is packaged as a procedure. It does not update the model contents and does not have any contention with CREATE_MODEL, DROP_MODEL, or RENAME_MODEL operations. The corollary is that if you potentially drop or rename a model while a

model is being applied to scoring data, the APPLY operation may discontinue with partial or unpredictable results.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will match the case identifier column name provided by you. The type of incoming case_id column is preserved in APPLY output.

Classification Algorithms

The table containing the APPLY results for all classification models has the same definition. For numerical targets, the results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
prediction   NUMBER
probability  NUMBER
```

For categorical targets, the results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
prediction   VARCHAR2
probability  NUMBER
```

One-Class SVM (Anomaly Detection)

The results table will have the following columns.

```
case_id       VARCHAR2/NUMBER
prediction    NUMBER
probability   NUMBER
```

Values in the prediction column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression using SVM

The results table will have the following columns.

```
case_id     VARCHAR2/NUMBER
prediction  NUMBER
```

Clustering using *k*-Means and O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table will have the following columns.

```
case_id      VARCHAR2/NUMBER
cluster_id   NUMBER
probability  NUMBER
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table will have the following columns

```
case_id        VARCHAR2/NUMBER
feature_id     NUMBER
match_quality  NUMBER
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if build data was pre-processed in any manner,
 * perform the same pre-processing steps on the
 * scoring data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
 */

/* apply the model to data to be scored */
DBMS_DATA_MINING.APPLY(
  model_name          => 'census_model',
  data_table_name     => 'census_2d_apply',
  case_id_column_name => 'person_id',
  result_table_name   => 'census_apply_result');
END;
/

-- View Apply Results
SELECT case_id, prediction, probability
  FROM census_apply_result;
```

COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes the confusion matrix for a classification model and also provides the accuracy of the model. See *Oracle Data Mining Concepts* for a description of confusion matrix.

Before executing a COMPUTE_CONFUSION_MATRIX procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
      accuracy                    OUT NUMBER,
      apply_result_table_name     IN  VARCHAR2,
      target_table_name           IN  VARCHAR2,
      case_id_column_name         IN  VARCHAR2,
      target_column_name          IN  VARCHAR2,
      confusion_matrix_table_name IN  VARCHAR2,
      score_column_name           IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name IN  VARCHAR2 DEFAULT 'PROBABILITY',
      cost_matrix_table_name      IN  VARCHAR2 DEFAULT NULL,
      apply_result_schema_name    IN  VARCHAR2 DEFAULT NULL,
      target_schema_name          IN  VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–9 COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
accuracy	Accuracy of the model
apply_result_table_name	Name of the table containing the results of an APPLY operation on the test dataset (see Usage Notes)
target_table_name	Name of the table or view containing only the case identifier column and target column values (see Usage Notes)
case_id_column_name	Name of the case identifier column in the test data set. This must be common across the target table and the apply results table.
target_column_name	Name of the target column in the target table
confusion_matrix_table_name	Name of the table into which the confusion matrix is to be generated
score_column_name	Name of the column representing the score from the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.
score_criterion_column_name	Name of the column representing the ranking factor for the score from the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. Values in this column must be represented numerically.

Table 25–9 (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
cost_matrix_table_name	Name of the fixed-schema cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can also provide a cost matrix as an optional input in order to have the cost of predictions reflected in the results.

It is important to note that the inputs to COMPUTE_CONFUSION_MATRIX do not always have to be generated using APPLY. As long as the definition of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can produce the confusion matrix and accuracy. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing.

Before you use the COMPUTE_CONFUSION_MATRIX procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. Use the result table name from APPLY as apply_result_table_name in the COMPUTE_CONFUSION_MATRIX procedure.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. Use the name of this second table as target_table_name.

The definition for the second view or table name for a numerical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name            NUMBER)
```

The definition for the second view or table name for a categorical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name            NUMBER)
```

You must provide the name of the table in which the confusion matrix is to be generated. The resulting fixed schema table will always be created in the schema owning the model.

For numerical target attributes, the confusion matrix table will have the definition:

```
(actual_target_value    NUMBER,
predicted_target_value  NUMBER,
value                   NUMBER)
```

For categorical target attributes, the confusion matrix table will have the definition:

```
(actual_target_value     VARCHAR2,
```

```
predicted_target_value   VARCHAR2,
value                    NUMBER)
```

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
  v_accuracy NUMBER;
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name           => 'census_model',
  data_table_name      => 'census_2d_test',
  case_id_column_name  => 'person_id',
  result_table_name    => 'census_test_result');
CREATE VIEW census_2d_test_view as select person_id, class from census_2d_test;

/* now compute the confusion matrix from the two
 * data streams, also providing a cost matrix as input.
 */
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
  accuracy                     => v_accuracy,
  apply_result_table_name      => 'census_test_result',
  target_table_name            => 'census_2d_test_view',
  case_id_column_name          => 'person_id',
  target_column_name           => 'class',
  confusion_matrix_table_name  => 'census_confusion_matrix',
  cost_matrix_table_name       => 'census_cost_matrix');
DBMS_OUTPUT.PUT_LINE('Accuracy of the model: ' || v_accuracy);
END;
/

-- View the confusion matrix using Oracle SQL
SELECT actual_target_value, predicted_target_value, value
  FROM census_confusion_matrix;
```

COMPUTE_LIFT Procedure

This procedure computes a lift table for a given positive target for a classification model. See *Oracle Data Mining Concepts* for a description of lift.

Before executing a COMPUTE_LIFT procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_LIFT (
      apply_result_table_name      IN VARCHAR2,
      target_table_name            IN VARCHAR2,
      case_id_column_name          IN VARCHAR2,
      target_column_name           IN VARCHAR2,
      lift_table_name              IN VARCHAR2,
      positive_target_value        IN VARCHAR2,
      score_column_name            IN VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN VARCHAR2 DEFAULT 'PROBABILITY',
      num_quantiles                IN NUMBER DEFAULT 10,
      cost_matrix_table_name       IN VARCHAR2 DEFAULT NULL,
      apply_result_schema_name     IN VARCHAR2 DEFAULT NULL,
      target_schema_name           IN VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–10 COMPUTE_LIFT Procedure Parameters

Parameter	Description
apply_result_table_name	Name of the table containing the results of an APPLY operation on the test dataset (see Usage Notes)
target_table_name	Name of the table or view containing only the case identifier column and target column values (see Usage Notes)
case_id_column_name	Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.
target_column_name	Name of the target column
lift_table_name	Name of the table into which the lift table is to be generated
positive_target_value	Value of the positive target. If the target column is of NUMBER type, use TO_CHAR() operator to provide the value as a string.
score_column_name	Name of the column representing the score in the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.

Table 25–10 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
score_criterion_column_name	Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. This column must be a numerical type.
num_quantiles	Number of quantiles required in the lift table
cost_matrix_table_name	Name of the cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can also provide a cost matrix as an optional input to have the cost of predictions reflected in the results.

It is important to note that the data inputs to COMPUTE_LIFT do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the lift table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the same binning table used in build pre-processing.

Before you use the COMPUTE_LIFT procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. The parameter apply_result_table_name in the COMPUTE_LIFT procedure represents the table that will be generated in your schema as a result of the APPLY operation.

Next, you must create a table or view containing only the case identifier column and the target column in its schema. The parameter target_table_name reflects this input. The definition for this view or table name for a numerical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name             NUMBER)
```

The definition for this view or table name for a categorical target attribute is:

```
(case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name            NUMBER)
```

You must provide the name of the table in which the lift table is to be generated. The resulting fixed schema table is always created in the schema that owns the model.

The resulting lift table will have the following definition:

```
(quantile_number               NUMBER,
 probability_threshold         NUMBER,
 gain_cumulative               NUMBER,
 quantile_total_count          NUMBER,
 quantile_target_count         NUMBER,
 percent_records_cumulative    NUMBER,
```

```
 lift_cumulative              NUMBER,
 target_density_cumulative    NUMBER,
 targets_cumulative           NUMBER,
 non_targets_cumulative       NUMBER,
 lift_quantile                NUMBER,
 target_density               NUMBER)
```

When a cost matrix is passed to the `COMPUTE_LIFT` procedure, the cost threshold is returned in the `probability_threshold` column.

The output columns are explained in *Oracle Data Mining Concepts*.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm, and you have been provided the test data in a table called `census_2d_test`, with case identifier column name `person_id`, and the target column name `class`.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name           => 'census_model',
  data_table_name      => 'census_2d_test,
  case_id_column_name  => 'person_id',
  result_table_name    => 'census_test_result');

/* next create a view from test data that projects
 * only the case identifier and target column
 */

/* now compute lift with the default 10 quantiles
 * from the two data streams
 */
DBMS_DATA_MINING.COMPUTE_LIFT (
  apply_result_table_name   => 'census_test_result',
  target_table_name         => 'census_2d_test_view',
  case_id_column_name       => 'person_id',
  target_column_name        => 'class',
  lift_table_name           => 'census_lift',
  positive_target_value     => '1',
  cost_matrix_table_name    => 'census_cost_matrix');
END;
/

-- View the lift table contents using SQL
SELECT *
  FROM census_lift;
```

COMPUTE_ROC Procedure

This procedure computes the receiver operating characteristic (ROC) for a binary classification model. See *Oracle Data Mining Concepts* for a description of receiver operating characteristic.

Before executing a `COMPUTE_ROC` procedure:

- Apply the model on the test data
- Create a target table or view containing only the case identifier and target columns from the test data

You will specify this table or view and the apply results table as input to the procedure.

Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
      roc_area_under_curve         OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      roc_table_name               IN  VARCHAR2,
      positive_target_value        IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–11 COMPUTE_ROC Procedure Parameters

Parameter	Description
`roc_area_under_the_curve`	A measure of model accuracy, specifically, the probability that the model will correctly rank a randomly chosen pair of rows of opposite classes.
`apply_result_table_name`	Name of the table containing the results of an `APPLY` operation on the test dataset (see Usage Notes)
`target_table_name`	Name of the table or view containing the case identifiers and target values from the test data. (See the Usage Notes.)
`case_id_column_name`	Name of the case identifier column in the test data set. This must be common across the targets table and the apply results table.
`target_column_name`	Name of the target column
`roc_table_name`	Name of the table into which ROC results are to be generated. See Table 25–12, " COMPUTE_ROC Output".
`positive_target_value`	Value of the positive target. If the target column is of `NUMBER` type, use `TO_CHAR()` operator to provide the value as a string.

Table 25–11 (Cont.) COMPUTE_ROC Procedure Parameters

Parameter	Description
score_column_name	Name of the column representing the score in the apply results table. In the fixed schema table generated by APPLY, this column has the name PREDICTION, which is the default.
score_criterion_column_name	Name of the column representing the ranking factor for the score in the apply results table. In the fixed schema table generated by APPLY for classification models, this column has the name PROBABILITY, which is the default. Values in this column must be represented numerically.
apply_result_schema_name	Name of the schema hosting the APPLY results table
target_schema_name	Name of the schema hosting the targets table

Usage Notes

It is important to note that the data inputs to COMPUTE_ROC do not always have to be generated using APPLY. As long as the schema of the two input tables matches the ones discussed in this section, with appropriate content, the procedure can provide the ROC table as output. The quality of the results depends on the quality of the data.

The data provided for testing your classification model must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing.

Before you use the COMPUTE_ROC procedure, you must prepare two data input streams from your test data.

First, you must APPLY the model on your test data. The parameter apply_result_table_name in the COMPUTE_ROC procedure identifies the table that will be generated in your schema as a result of the APPLY operation.

Next, you must create a table or view containing only the case identifiers and target values from the test data. The parameter target_table_name identifies this table. For a numerical target attribute, the columns of this table are:

```
case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name           NUMBER
```

For a categorical target attribute, the columns of this table are:

```
case_identifier_column_name  VARCHAR2/NUMBER,
target_column_name           VARCHAR2
```

You must provide the name of the table in which the ROC table is to be generated. The resulting table will always be created in the schema that owns the model, and it will always have the following columns.

```
(probability              NUMBER,
 true_positives           NUMBER,
 false_negatives          NUMBER,
 false_positives          NUMBER,
 true_negatives           NUMBER,
 true_positive_fraction   NUMBER,
 false_positive_fraction  NUMBER)
```

The output columns are explained in Table 25–12.

Table 25–12 COMPUTE_ROC Output

Output Column	Description
probability	Minimum predicted positive class probability resulting in a positive class prediction. Thus, different threshold values result in different hit rates and false_alarm_rates.
true_negatives	Negative cases in the test data with predicted probabilities below the probability_threshold (correctly predicted)
true_positives	Positive cases in the test data with predicted probabilities above the probability_threshold (correctly predicted)
false_negatives	Positive cases in the test data with predicted probabilities below the probability_threshold (incorrectly predicted)
false_positives	Negative cases in the test data with predicted probabilities above the probability_threshold (incorrectly predicted)
true_positive_ fraction	true_positives/(true_positives + false_ negatives)
false_positive_ fraction	false_positives/(false_positives + true_ negatives)

The typical use scenario is to examine the true_positive_fraction and false_ positive_fraction to determine the most desirable probability_threshold. This threshold is then used to predict class values in subsequent apply operations. For example, to identify positively predicted cases in probability rank order from an apply result table, given a probability_threshold:

```
select case_id_column_name from apply_result_table_name where probability >
probability_threshold order by probability DESC;
```

There are two procedures one might use to identify the most desirable probability_ threshold. One procedure applies when the relative cost of positive class versus negative class prediction errors are known to the user. The other applies when such costs are not well known to the user. In the first instance, one can apply the relative costs to the ROC table to compute the minimum cost probability_threshold. Suppose the relative cost ratio, Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like:

```
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false positives cost
    FROM ROC_table
  GROUP BY probability_threshold),
    minCost AS (
      SELECT min(cost) minCost
        FROM cost)
      SELECT max(probability_threshold)probability_threshold
        FROM cost, minCost
    WHERE cost = minCost;
```

If relative costs are not well known, the user simply scans the values in the table (in sorted order) and makes a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable:

```
select * from ROC_table order by probability_threshold
```

Examples

Assume that you have built a classification model census_model using the SVM algorithm, and you have been provided the test data in a table called census_2d_

test, with case identifier column name person_id, and the target column name class.

```
DECLARE
  v_sql_stmt VARCHAR2(4000);
  v_accuracy NUMBER;
BEGIN

/* apply the model census_model on test data */
DBMS_DATA_MINING.APPLY(
  model_name           => 'census_model',
  data_table_name      => 'census_2d_test',
  case_id_column_name  => 'person_id',
  result_table_name    => 'census_test_result');

/* next create a view from test data that projects
 * only the case identifier and target column
 */
v_sql_stmt :=
'CREATE VIEW census_2d_test_view AS ' ||
'SELECT person_id, class FROM census_2d_test';
EXECUTE IMMEDIATE v_sql_stmt;

/* now compute the receiver operating characterestics from
 * the two data streams, also providing a cost matrix
 * as input.
 */
DBMS_DATA_MINING.COMPUTE_ROC (
  accuracy                => v_accuracy,
  apply_result_table_name  => 'census_test_result',
  target_table_name        => 'census_2d_test_view',
  case_id_column_name      => 'person_id',
  target_column_name       => 'class',
  roc_table_name           => 'census_roc',
  cost_matrix_table_name   => 'census_cost_matrix');
END;
/

-- View the ROC results using Oracle SQL
SELECT *
  FROM census_roc;
```

CREATE_MODEL Procedure

This procedure creates a mining model for a given mining function

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
      model_name            IN VARCHAR2,
      mining_function       IN VARCHAR2,
      data_table_name       IN VARCHAR2,
      case_id_column_name   IN VARCHAR2,
      target_column_name    IN VARCHAR2 DEFAULT NULL,
      settings_table_name   IN VARCHAR2 DEFAULT NULL,
      data_schema_name      IN VARCHAR2 DEFAULT NULL,
      settings_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–13 CREATE_MODEL Procedure Parameters

Parameter	Description
model_name	Name of the model. (See "Model Names" on page 25-5)
mining_function	Constant representing the mining function. See "Constants that Specify the Mining Function" on page 25-6
data_table_name	Name of the table or view containing the training data
case_id_column_name	Name of the case identifier column
target_column_name	Name of the target column — NULL for descriptive models and for One-Class SVM models
settings_table_name	Name of the table or view containing mining function settings and algorithm settings
data_schema_name	Name of the schema hosting the training data
settings_schema_name	Name of the schema hosting the settings table/view

Usage Notes

The data provided to all subsequent operations such as APPLY must match the data provided to CREATE_MODEL in schema and relevant content. If the data provided as input to CREATE_MODEL has been pre-processed, then the data input to subsequent operations such as APPLY must also be pre-processed using the statistics from the CREATE_MODEL data pre-processing. The case identifier column is not considered to be a mining attribute during CREATE_MODEL.

You can view the default settings for each algorithm through GET_DEFAULT_SETTINGS. You can override the defaults by providing a settings table specifying your choice of mining algorithm and relevant overriding algorithm settings.

Once a model has been built, information about the attributes used for model build can be obtained from GET_MODEL_SIGNATURE. To inspect or review model contents, you can use any of the algorithm-specific GET_MODEL_DETAILS functions.

The behavior of the CREATE_MODEL is analogous to a SQL DDL CREATE operation. It contends with RENAME_MODEL and DROP_MODEL operations.

Note: The CREATE_MODEL operation creates a set of tables in the owner's schema to store the patterns and information that constitute a mining model for a particular algorithm.The names of these tables have the prefix DM$. The number, schema, and content of these tables is Oracle proprietary and may change from release to release. You must not direct any queries or updates against these system tables.

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```
/* prepare a settings table to override default
 * settings (Naive Bayes is the default classifier)
 */
CREATE TABLE census_settings (
  setting_name  VARCHAR2(30),
  setting_value VARCHAR2(128));

BEGIN
/* indicate that SVM is the chosen classifier */
INSERT INTO census_settings VALUES (
DBMS_DATA_MINING.ALGO_NAME, DBMS_DATA_MINING.ALGO_SUPPORT_VECTOR_MACHINES);

/* override the default value for complexity factor */
INSERT INTO census_settings (setting_name, setting_value)
VALUES (dbms_data_mining.svms_complexity_factor, TO_CHAR(0.081));
COMMIT;

/* build a model with name census_model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'census_model',
  mining_function      => DBMS_DATA_MINING.CLASSIFICATION,
  data_table_name      => 'census_2d_build',
  case_id_column_name  => 'person_id',
  target_column_name   => 'class',
  settings_table_name  => 'census_settings');
END;
/
```

You use similar code to build a One-Class SVM model. The main difference is that the target column is empty.

```
/* prepare a settings table to override default
 * settings (Naive Bayes is the default classifier)
 */
CREATE TABLE census_settings (
  setting_name  VARCHAR2(30),
  setting_value VARCHAR2(128));

BEGIN
/* indicate that SVM is the chosen classifier */
INSERT INTO census_settings VALUES (
DBMS_DATA_MINING.ALGO_NAME, DBMS_DATA_MINING.ALGO_SUPPORT_VECTOR_MACHINES);

/* override the default value for outlier rate */
INSERT INTO census_settings (setting_name, setting_value)
VALUES (dbms_data_mining.svms_outlier_rate, TO_CHAR(0.05));
COMMIT;
```

```
/* build a model with name census_model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'census_model',
  mining_function      => DBMS_DATA_MINING.CLASSIFICATION,
  data_table_name      => 'census_2d_build',
  case_id_column_name  => 'person_id',
  target_column_name   => NULL,
  settings_table_name  => 'census_settings');
END;
/
```

DROP_MODEL Procedure

This procedure drops an existing mining model from the user's schema.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2);
```

Parameters

Table 25–14 DROP_MODEL Procedure Parameters

Parameter	Description
model_name	Name of the model

Usage Notes

You can use DROP_MODEL to drop an existing mining model.

The behavior of the DROP_MODEL is similar to a SQL DDL DROP operation. It blocks RENAME_MODEL and CREATE_MODEL operations. It does not block or block on APPLY, which is a SQL query-like operation that does not update any model data.

If an APPLY operation is using a model, and you attempt to drop the model during that time, the DROP will succeed and APPLY will return indeterminate results. This is in line with the conventional behavior in the RDBMS, where DDL operations do not block on query operations.

Examples

Assume the existence of a model census_model. The following example shows how to drop this model.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'census_model');
END;
/
```

EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. You can import from the dump file set using the IMPORT_MODEL procedure. Both EXPORT_MODEL and IMPORT_MODEL use Oracle Data Pump technology.

> **See Also:** *Oracle Data Mining Administrator's Guide* for more information on model export and import.

Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
      filename          IN VARCHAR2,
      directory         IN VARCHAR2,
      model_filter      IN VARCHAR2 DEFAULT NULL,
      filesize          IN VARCHAR2 DEFAULT NULL,
      operation         IN VARCHAR2 DEFAULT NULL,
      remote_link       IN VARCHAR2 DEFAULT NULL,
      jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–15 EXPORT_MODEL Procedure Parameters

Parameter	Description
filename	Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the filesize parameter, or you can use the operation parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to *filename01.dmp*, even if there is only one file in the dump set. If there are additional files, they are named sequentially as *filename02.dmp*, *filename03.dmp*, and so forth.
directory	Name of a pre-defined directory object that specifies where the dump file set should be created. You must have read/write privileges on the directory object and on the file system directory that it identifies.
model_filter	Optional parameter that specifies which model or models to export. If you do not specify a value for model_filter, all models in the schema are exported. You can also specify NULL (the default) or 'ALL' to export all models. You can export individual models by name and groups of models that share a given characteristic. For instance, you could export all Naive Bayes models or all models that use the same target attribute. See the Usage Notes for more information. Examples are provided in Table 25–16.
filesize	Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB. If the size of the models to export is larger than filesize, one or more additional files are created within the dump set. See the description of the filename parameter for more information.

Table 25–15 (Cont.) EXPORT_MODEL Procedure Parameters

Parameter	Description
operation	Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the filesize parameter determines the size of the files. You can specify either of the following values for operation: ▪ 'EXPORT' — Export all or the specified models. (Default) ▪ 'ESTIMATE' — Estimate the size of the exporting models.
remote_link	Optional parameter not used in this release. Set to NULL.
jobname	Optional parameter that specifies the name of the export job. By default, the name has the form *username*_exp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_exp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named *jobname.log*, is created in the same directory as the dump file set.

Usage Notes

The model_filter parameter specifies which models to export. You can list the models by name, or you can identify a group of models that share a given characteristic. To specify models by name, provide a single model name or a comma-delimited list of model names. To specify a group of models that share a characteristic, use a conditional expression that completes the WHERE clause of a query against the DM_USER_MODELS view. DM_USER_MODELS lists the models in the current schema. It has the following columns.

```
Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 NAME                                      NOT NULL VARCHAR2(25)
 FUNCTION_NAME                                      VARCHAR2(30)
 ALGORITHM_NAME                                     VARCHAR2(30)
 CREATION_DATE                                      DATE
 BUILD_DURATION                                     NUMBER
 TARGET_ATTRIBUTE                                   VARCHAR2(30)
 MODEL_SIZE                                         NUMBER
```

For descriptions of the columns in DM_USER_MODELS, see "User Views" on page 25-14.

To construct a conditional expression for model_filter, specify a column name, a supported conditional operator, and a value. The supported conditional operators are: <, <=, =, =>, >, LIKE, IN. For information on conditional operators and WHERE clauses, see *Oracle Database SQL Reference*.

Examples of model filters are provided in Table 25–16.

Table 25–16 Sample Values for the Model Filter Parameter

Sample Value	Meaning
'mymodel'	Export the model named mymodel
'mymodel2, mymodel3'	Export the models named mymodel2 and mymodel3
'name= ''mymodel'''	Export the model named mymodel
'name IN (''mymodel2'',''mymodel3'')'	Export the models named mymodel2 and mymodel3

Table 25–16 (Cont.) Sample Values for the Model Filter Parameter

Sample Value	Meaning
`'name LIKE ''AI%'''`	Export all models that have names starting with `AI`
`'ALGORITHM_NAME = ''NAIVE_BAYES'''`	Export all Naive Bayes models. See Table 25–2 for a list of algorithm names.
`'FUNCTION_NAME =''CLASSIFICATION'''`	Export all classification models. See Table 25–1 for a list of mining functions.

Examples

The following statement exports all the models in the `DMUSER3` schema to a dump file set called `models_out` in the directory `$ORACLE_HOME/rdbms/log`. This directory is mapped to a directory object called `DATA_PUMP_DIR`. The `DMUSER3` user has read/write access to the directory and to the directory object.

```
SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

You can exit SQL*Plus and list the resulting dump file and log file.

```
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
```

The following example uses the same directory object and is executed by the same user. It exports the models called `NMF_SH_SAMPLE` and `SVMR_SH_REGR_SAMPLE` to a different dump file set in the same directory.

```
SQL>execute dbms_data_mining.export_model ( 'models2_out', 'DATA_PUMP_DIR',
            'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
 DMUSER3_exp_924.log  models2_out01.dmp
```

Using the same directory object and schema, this example exports all models whose target is `AFFINITY_CARD`.

```
SQL>execute dbms_data_mining.export_model ('models050402_out',
                'DATA_PUMP_DIR', 'target_attribute = ''AFFINITY_CARD''',
                '1M', 'EXPORT', NULL, 'models050402_job');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
 DMUSER3_exp_924.log   models2_out01.dmp
 models050402_job.log  models050402_out01.dmp   models050402_out02.dmp
```

GET_ASSOCIATION_RULES Function

This table function returns the rules from an Association model.

You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the topn parameter.

Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
   model_name            IN VARCHAR2,
   topn                  IN NUMBER DEFAULT NULL,
   rule_id               IN INTEGER DEFAULT NULL,
   min_confidence        IN NUMBER DEFAULT NULL,
   min_support           IN NUMBER DEFAULT NULL,
   max_rule_length       IN INTEGER DEFAULT NULL,
   min_rule_length       IN INTEGER DEFAULT NULL,
   sort_order            IN DMSYS.ORA_MINING_VARCHAR2_NT DEFAULT NULL,
   antecedent_items      IN DYSYS.ORA_MINING_VARCHAR2_NT DEFAULT NULL,
   consequent_items      IN DYSYS.ORA_MINING_VARCHAR2_NT DEFAULT NULL)
 RETURN DM_RULES PIPELINED;
```

Parameters

Table 25–17 GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
model_name	Name of the model. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
topn	Return the *n* top rules ordered by confidence and then support, both descending. If you specify a sort order, the top *n* rules are derived after the sort is performed. If topn is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are RULE_CONFIDENCE and RULE_SUPPORT. If *topn* is specified and a maximum or minimum rule length *is* specified, then RULE_CONFIDENCE, RULE_SUPPORT, and NUMBER_OF_ITEMS are allowed in the sort order.
rule_id	Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.
min_confidence	Return the rules with confidence greater than or equal to this number
min_support	Return the rules with support greater than or equal to this number
max_rule_length	Return the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 25–18). For example, in the rule A=>B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.

Table 25–17 (Cont.) GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
min_rule_length	Return the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sort the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you would specify: DMSYS.ORA_MINING_VARCHAR2_NT('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC') If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by confidence in descending order, then by support in descending order. See the examples.
antecedent_items	Return the rules with these items in the antecedent. See the examples.
consequent_items	Return the rules with this item in the consequent. See the examples.

Return Values

Table 25–18 GET_ASSOCIATION RULES Function Return Values

Return Value	Description
DM_RULES	Represents a set of rows of type DM_RULE. The rows have the following columns: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER) The antecedent and consequent columns each return nested tables of type DM_PREDICATES.The rows, of type DM_PREDICATE, have the following columns: (attribute_name VARCHAR2(30), conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

This table function pipes out rows of type DM_RULES. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

The DMSYS.ORA_MINING_VARCHAR2_NT type is defined as a table of VARCHAR2(4000).

Examples

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE census_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following example returns all the rules which have 'AQUATIC' or 'EGGS' in the antecedent, and has 'VENOMOUS' as the consequent. The rules are sorted first by NUMBER_OF_ITEMS in descending order, then by RULE_CONFIDENCE in descending order, and finally by RULE_SUPPORT in descending order.

```
SELECT * FROM TABLE
(    DBMS_DATA_MINING.GET_ASSOCIATION_RULES
       ('AR_Model_31', 120, NULL, 1, .51, 7,
         DMSYS.ORA_MINING_VARCHAR2_NT
          ('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
         DMSYS.ORA_MINING_VARCHAR2_NT('AQUATIC', 'EGGS'),
         DMSYS.ORA_MINING_VARCHAR2_NT('VENOMOUS')));
```

GET_DEFAULT_SETTINGS Function

This table function returns the default settings for all mining functions and algorithms supported in the DBMS_DATA_MINING package.

Syntax

```
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
  RETURN DM_MODEL_SETTINGS PIPELINED;
```

Return Values

Table 25–19 GET_DEFAULT_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

This table function pipes out rows of type DM_MODEL_SETTING. For information on ODM data types and ODM data types and piped output from table functions, see "Data Types" on page 25-10.

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

Examples

For example, if you want to override some or all of *k*-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```
BEGIN
  CREATE TABLE mysettings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
   WHERE setting_name LIKE 'KMNS%';
  -- now update individual settings as required
  UPDATE mysettings
     SET setting_value = 0.02
   WHERE setting_name = DBMS_DATA_MINING.KMNS_MIN_PCT_ATTR_SUPPORT;
END;
/
```

GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult *Oracle Data Mining Concepts*.

Syntax

```
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (
    model_name        IN VARCHAR2,
    topn              IN NUMBER DEFAULT NULL)
  RETURN DM_ITEMSETS PIPELINED;
```

Parameters

Table 25–20 GET_FREQUENT_ITEMSETS Function Parameters

Parameter	Description
model_name	Name of the model
topn	When not NULL, return the top *n* rows ordered by support in descending order

Return Values

Table 25–21 GET_FREQUENT_ITEMSETS Function Return Values

Return Value	Description
DM_ITEMSETS	Represents a set of rows of type DM_ITEMSET. The rows have the following columns: (itemsets_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER) The items column returns a nested table of type DM_ITEMS. The table has one column of type VARCHAR2(4000), which contains individual item names.

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

Examples

The following example demonstrates an Association model build followed by an invocation of GET_FREQUENT_ITEMSETS table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
    SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;
```

```
/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'market_model',
  function             => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name      => 'market_build',
  case_id_column_name  => 'item_id',
  target_column_name   => NULL,
  settings_table_name  => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

GET_MODEL_DETAILS_ABN Function

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN (
    model_name          IN VARCHAR2)
  RETURN DM_ABN_DETAILS PIPELINED;
```

Parameters

Table 25–22 GET_MODEL_DETAILS_ABN Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–23 GET_MODEL_DETAILS_ABN Function Return Values

Return Value	Description
DM_ABN_DETAILS	Represents a set of rows of type DM_ABN_DETAIL. The rows have the following columns: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER) The antecedent and consequent columns of DM_ABN_DETAIL each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns: (attribute_name VARCHAR2(30), conditional_operator CHAR(2), /*=,<>,<,>,<=,>=*/ attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

This table function pipes out rows of type DM_ABN_DETAIL. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

This function returns details only for a single feature ABN model.

Examples

The following example demonstrates an ABN model build followed by an invocation of GET_MODEL_DETAILS_ABN table function from Oracle SQL.

```
BEGIN
  -- prepare a settings table to override default algorithm and model type
  CREATE TABLE abn_settings (setting_name VARCHAR2(30),
  setting_value
VARCHAR2(128));
  INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ALGO_NAME,
```

```
    DBMS_DATA_MINING.ALGO_ADAPTIVE_BAYES_NETWORK);
  INSERT INTO abn_settings VALUES
    (DBMS_DATA_MINING.ABNS_MODEL_TYPE,
     DBMS_DATA_MINING.ABNS_SINGLE_FEATURE);
   COMMIT;
  -- create a model
  DBMS_DATA_MINING.CREATE_MODEL (
    model_name           => 'abn_model',
    function             => DBMS_DATA_MINING.CLASSIFICATION,
    data_table_name      => 'abn_build',
    case_id_column_name  => 'id',
    target_column_name   => NULL,
    settings_table_name  => 'abn_settings');
END;
/
-- View the (unformatted) results from SQL*Plus
SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN('abn_model'));
```

GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (
  model_name          IN VARCHAR2)
 RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

Table 25–24 GET_MODEL_DETAILS_AI Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–25 GET_MODEL_DETAILS_AI Function Return Values

Return Value	Description
DM_RANKED_ATTRIBUTES	Represents a set of rows of type DM_RANKED_ATTRIBUTE. The rows have the following columns: (attribute_name VARCHAR2(30), importance_value NUMBER, rank NUMBER(38))

GET_MODEL_DETAILS_KM Function

This table function returns a set of rows that provide the details of a *k*-Means clustering model.

You can provide input to `GET_MODEL_DETAILS_KM` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, `GET_MODEL_DETAILS_KM` returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (
          model_name         VARCHAR2,
          cluster_id         NUMBER    DEFAULT NULL,
          attribute          VARCHAR2  DEFAULT NULL,
          centroid           NUMBER    DEFAULT 1,
          histogram          NUMBER    DEFAULT 1,
          rules              NUMBER    DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 25–26 GET_MODEL_DETAILS_KM Function Parameters

Parameter	Description
`model_name`	Name of the model
`cluster_id`	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
`attribute`	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
`centroid`	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
`histogram`	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
`rules`	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 25–27 GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: (id INTEGER, record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(30), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(30), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER) The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(30), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER) The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER)

Table 25–27 (Cont.) GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description

	The `antecedent` and `consequent` columns of `DM_RULE` each return nested tables of type `DM_PREDICATES`. The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(30),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

The table function pipes out rows of type `DM_CLUSTERS`. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

Examples

The following example demonstrates a *k*-Means clustering model build followed by an invocation of `GET_MODEL_DETAILS_KM` table function from Oracle SQL.

```
BEGIN
-- create a settings table
UPDATE cluster_settings
   SET setting_value = 3
 WHERE setting_name = DBMS_DATA_MINING.KMEANS_BLOCK_GROWTH;

/* build a k-Means clustering model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'eight_clouds',
  function             => DBMS_DATA_MINING.CLUSTERING,
  data_table_name      => 'eight_clouds_build',
  case_id_column_name  => 'id',
  target_column_name   => NULL,
  settings_table_name  => 'cluster_settings');
END;
/

-- View the (unformatted) rules from SQL*Plus
SELECT id, record_count, parent, tree_level, dispersion,
       child, centroid, histogram, rule
  FROM TABLE(DBMS_DATA_MINING_GET_MODEL_DETAILS_KM('eight_clouds'));
```

GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
   model_name      IN       VARCHAR2)
 RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

Table 25–28 GET_MODEL_DETAILS_NB Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–29 GET_MODEL_DETAILS_NB Function Return Values

Return Value	Description
DM_NB_DETAILS	Represents a set of rows of type DM_NB_DETAIL. The rows have the following columns: (target_attribute_name VARCHAR2(30), target_attribute_str_value VARCHAR2(4000), target_attribute_num_value NUMBER, prior_probability NUMBER, conditionals DM_CONDITIONALS) The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns: (attribute_name VARCHAR2(30), attribute_str_value VARCHAR2(4000), attribute_num_value NUMBER, conditional_probability NUMBER)

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model details as shown in this example.

```
-- You can view the Naive Bayes model details in many ways
-- Consult the Oracle Application Developer's Guide -
-- Object-Relational Features for different ways of
-- accessing Oracle Objects.

-- View the (unformatted) details from SQL*Plus
SELECT attribute_name, attribute_num_value, attribute_str_value,
       prior_probability, conditionals,
```

```
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('census_model');
```

See `nbdemo.sql` for generation of formatted rules.

GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
   model_name        IN        VARCHAR2)
 RETURN DM_NMF_FEATURE_SET PIPELINED;
```

Parameters

Table 25–30 GET_MODEL_DETAILS_NMF Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–31 GET_MODEL_DETAILS_NMF Function Return Values

Return Value	Description
DM_NMF_FEATURE_SET	Represents a set of rows of DM_NMF_FEATURE. The rows have the following columns: (feature_id NUMBER, attribute_set DM_NMF_ATTRIBUTE_SET) The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns: (attribute_name VARCHAR2(30), attribute_value VARCHAR2(4000), coefficient NUMBER)

Usage Notes

The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

Examples

Assume you have built an NMF model called my_nmf_model. You can retrieve model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT feature_id, attribute_set
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF(
        'my_nmf_model'));
```

GET_MODEL_DETAILS_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to GET_MODEL_DETAILS_OC to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_OC returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
         model_name         VARCHAR2,
         cluster_id         NUMBER    DEFAULT NULL,
         attribute          VARCHAR2  DEFAULT NULL,
         centroid           NUMBER    DEFAULT 1,
         histogram          NUMBER    DEFAULT 1,
         rules              NUMBER    DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 25–32 GET_MODEL_DETAILS_OC Function Parameters

Parameter	Description
model_name	Name of the model
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 25–33 GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: (id INTEGER, record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(30), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(30) mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER) The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(30), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER) The rule column of DM_CLUSTER returns a single row of type DM_RULE. The columns are: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER)

Table 25–33 (Cont.) GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description

	The `antecedent` and `consequent` columns each return nested tables of type `DM_PREDICATES`.The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(30),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

The table function pipes out rows of type `DM_CLUSTER`. For information about ODM data types and piped output from table functions, see "Data Types" on page 25-10.

Examples

Assume you have built an OC model called `my_oc_model`. You can retrieve information from the model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT T.id           clu_id,
       T.record_count rec_cnt,
       T.parent       parent,
       T.tree_level   tree_level
  FROM (SELECT *
          FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                 'my_oc_model'))
        ORDER BY id) T
 WHERE ROWNUM < 11;
```

GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a Support Vector Machine model. This is applicable only for classification or regression models built using a linear kernel. For any other kernel, the table function returns ORA-40215.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
  model_name      IN       VARCHAR2)
 RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

Parameters

Table 25–34 GET_MODEL_DETAILS_SVM Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–35 GET_MODEL_DETAILS_SVM Function Return Values

Return Value	Description
DM_SVM_LINEAR_COEFF_SET	Represents a set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns: (class VARCHAR2(4000), attribute_set DM_SVM_ATTRIBUTE_SET) The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns: (attribute_name VARCHAR2(30), attribute_value VARCHAR2(4000), coefficient NUMBER) See Usage Notes.

Usage Notes

The table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

The class column of DM_SVM_LINEAR_COEFF represents classification target values. For regression targets, class is NULL. For each classification target value for classification models, a set of coefficients is returned. For binary classification, one-class classifier, and regression models, only a single set of coefficients is returned.

The attribute_value column in the nested table DM_SVM_ATTRIBUTE_SET is used for categorical attributes. The coefficient column is the linear coefficient value.

Examples

The following example demonstrates an SVM model build followed by an invocation of GET_MODEL_DETAILS_SVM table function from Oracle SQL:

```
-- Create SVM model
```

```
BEGIN
  dbms_data_mining.create_model(
    model_name           => 'SVM_Clas_sample',
    mining_function      => dbms_data_mining.classification,
    data_table_name      => 'svmc_sample_build_prepared',
    case_id_column_name  => 'id',
    target_column_name   => 'affinity_card',
    settings_table_name  => 'svmc_sample_settings');
END;
/
-- Display model details
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVM_Clas_sample'))
ORDER BY class;
```

GET_MODEL_DETAILS_XML Function

This table function returns an XML object that provides the details of a Decision Tree model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (
  model_name      IN       VARCHAR2)
 RETURN XMLTYPE;
```

Parameters

Table 25–36 GET_MODEL_DETAILS_XML Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–37 GET_MODEL_DETAILS_XML Function Return Value

Return Value	Description
XMLTYPE	The PMML 2.1 XML definition for the decision tree model.

Usage Notes

The function returns the XML representing the decision tree; the definition is the one specified in the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at http://www.dmg.org.

GET_MODEL_SETTINGS Function

This table function returns the list of settings that were used to build the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SETTINGS(
   model_name           IN VARCHAR2)
 RETURN DM_MODEL_SETTINGS PIPELINED;
```

Parameters

Table 25–38 GET_MODEL_SETTINGS Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–39 GET_MODEL_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

The table function pipes out rows of type DM_MODEL_SETTING. For information about ODM data types and piped output from table functions, see "Data Types" on page 25-10.

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```
SELECT setting_name, setting_value
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```

GET_MODEL_SIGNATURE Function

This table function returns the model signature, which is a set of rows that provide the name and type of each attribute required as input to the APPLY operation.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SIGNATURE(
  model_name           IN VARCHAR2)
RETURN DM_MODEL_SIGNATURE PIPELINED;
```

Parameters

Table 25–40 GET_MODEL_SIGNATURE Function Parameters

Parameter	Description
model_name	Name of the model

Return Values

Table 25–41 GET_MODEL_SIGNATURE Function Return Values

Return Value	Description
DM_MODEL_SIGNATURE	Represents a set of rows of type DM_MODEL_SIGNATURE_ATTRIBUTE. The rows have the following columns: (attribute_name VARCHAR2(30), attribute_type VARCHAR2(106))

Usage Notes

This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on ODM data types and piped output from table functions, see "Data Types" on page 25-10.

You can use this table function to get the list of attributes used for building the model. This is particularly helpful to describe a model when an APPLY operation on test or scoring data is done a significant time period after the model is built, or after it is imported into another definition.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```
SELECT attribute_name, attribute_type
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model');
```

IMPORT_MODEL Procedure

This procedure imports the specified data mining models from a dump file set that was created with EXPORT_MODEL or with the expdp export utility. Both IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology.

> **See Also:** *Oracle Data Mining Administrator's Guide* for more information on model export and import.

Syntax

```
DBMS_DATA_MINING.IMPORT_MODEL (
    filename             IN  VARCHAR2,
    directory            IN  VARCHAR2,
    model_filter         IN  VARCHAR2 DEFAULT NULL,
    operation            IN  VARCHAR2 DEFAULT NULL,
    remote_link          IN  VARCHAR2 DEFAULT NULL,
    jobname              IN  VARCHAR2 DEFAULT NULL,
    schema_remap         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–42 IMPORT_MODEL Procedure Parameters

Parameter	Description
filename	Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to "EXPORT_MODEL Procedure" on page 25-34 for details.) If the dump file set contains multiple files, you can specify '*filename*%U' instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying 'archive%U'.
directory	Name of a pre-defined directory object that specifies where the dump file set is located. You must have read/write privileges on the directory object and on the file system directory that it identifies.
model_filter	Optional parameter that specifies which model or models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. You can import individual models by name and groups of models that share a given characteristic. For instance, you could import all Naive Bayes models or all models that use the same target attribute. See the Usage Notes for more information. Examples are provided in Table 25–43.
operation	Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for operation: ■ 'IMPORT' — Import the models (Default) ■ 'SQL_FILE'— Write the SQL DDL for creating the models to a text file. The text file is named *job_name*.sql and is located in the dump set directory.
remote_link	Optional parameter not used in this release. Set to NULL

Table 25–42 (Cont.) IMPORT_MODEL Procedure Parameters

Parameter	Description
jobname	Optional parameter that specifies the name of the import job. By default, the name has the form *username*_imp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the import job, named *jobname*.log, is created in the same directory as the dump file set.
schema_remap	Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form *export_user*:*import_user*. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. NOTE: In some cases, you may need to have the IMPORT_FULL_DATABASE privilege or the SYS role to import a model from a different schema.

Usage Notes

The model_filter parameter specifies which models to import. You can list the models by name, or you can identify a group of models that share a given characteristic. To specify models by name, provide a single model name or a comma-delimited list of model names. To specify a group of models that share a characteristic, use a conditional expression that completes the WHERE clause of a query against the DM_USER_MODELS view. DM_USER_MODELS lists the models in the current schema. It has the following columns.

```
Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 NAME                                      NOT NULL VARCHAR2(25)
 FUNCTION_NAME                                      VARCHAR2(30)
 ALGORITHM_NAME                                     VARCHAR2(30)
 CREATION_DATE                                      DATE
 BUILD_DURATION                                     NUMBER
 TARGET_ATTRIBUTE                                   VARCHAR2(30)
 MODEL_SIZE                                         NUMBER
```

For descriptions of the columns in DM_USER_MODELS, see "User Views" on page 25-14.

To construct a conditional expression for model_filter, specify a column name, a supported conditional operator, and a value. The supported conditional operators are: <, <=, =, =>, >, LIKE, IN. For information on conditional operators and WHERE clauses, see *Oracle Database SQL Reference*

Examples of model filters are provided in Table 25–43.

Table 25–43 Sample Values for the Model Filter Parameter

Sample Value	Meaning
'mymodel'	Import the model named mymodel.
'mymodel2, mymodel3'	Import the models named mymodel2 and mymodel3.
'name= ''mymodel'''	Import the model named mymodel.
'name IN (''mymodel2'',''mymodel3'')'	Import the models named mymodel2 and mymodel3.

Table 25–43 (Cont.) Sample Values for the Model Filter Parameter

Sample Value	Meaning
`'name LIKE ''AI%'''`	Import all models that have names starting with `AI`.
`'ALGORITHM_NAME = ''NAIVE_BAYES'''`	Import all Naive Bayes models. See Table 25–2 for a list of algorithm names.
`'FUNCTION_NAME =''CLASSIFICATION'''`	Import all classification models. See Table 25–1 for a list of mining functions.

Examples

This example shows a model being exported and imported within the schema `dmuser2`. Then the same model is imported into the `dmuser3` schema. The `dmuser3` user has the `IMPORT_FULL_DATABASE` privilege.

```
SQL>CONNECT dmuser2/dmuser2_psw
SQL>SELECT name FROM dm_user_models;
    NAME
    ------------------------
    NMF_SH_SAMPLE
    SVMO_SH_CLAS_SAMPLE
    SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ('NMF_SH_SAMPLE_out', 'DATA_PUMP_DIR',
                            'name = ''NMF_SH_SAMPLE''');
-- import the model back into the same schema
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                            'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''');

-- connect as different user
-- import same model into that schema
SQL>CONNECT dmuser3/dmuser3_psw
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                            'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''',
                            'IMPORT', NULL, 'nmf_imp_job', 'dmuser2:dmuser3');
```

The following example shows user `MARY` importing all models from a dump file, `model_exp_001.dmp`, which was created by user `SCOTT`. The dump file is located in the file system directory mapped to a directory object called `DM_DUMP`. If user `MARY` does not have `IMPORT_FULL_DATABASE` privileges, `IMPORT_MODEL` will raise an error.

```
-- import all models
DECLARE
  file_name       VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
                filename=>file_name,
               directory=>'DM_DUMP',
                schema_remap=>'SCOTT:MARY');
  DBMS_OUTPUT.PUT_LINE(
'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```
DBMS_DATA_MINING.RANK_APPLY (
      apply_result_table_name        IN VARCHAR2,
      case_id_column_name            IN VARCHAR2,
      score_column_name              IN VARCHAR2,
      score_criterion_column_name    IN VARCHAR2,
      ranked_apply_result_tab_name   IN VARCHAR2,
      top_N                          IN INTEGER DEFAULT 1,
      cost_matrix_table_name         IN VARCHAR2 DEFAULT NULL,
      apply_result_schema_name       IN VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 25–44 RANK_APPLY Procedure Parameters

Parameter	Description
apply_result_table_name	Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes)
case_id_column_name	Name of the case identifier column. This must be the same as the one used for generating APPLY results.
score_column_name	Name of the prediction column in the apply results table
score_criterion_column_name	Name of the probability column in the apply results table
ranked_apply_result_tab_name	Name of the table containing the ranked apply results
top_N	Top N predictions to be considered from the APPLY results for precision recall computation
cost_matrix_table_name	Name of the cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can use RANK_APPLY to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of RANK_APPLY is similar to that of APPLY with respect to other DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from APPLY.

The main intended use of RANK_APPLY is for the generation of the final APPLY results against the scoring data in a production setting. You can apply the model against test

data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will be the same case identifier column as that of the apply results.

Classification Models — NB, ABN, SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id       VARCHAR2/NUMBER,
prediction     NUMBER,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id       VARCHAR2/NUMBER,
prediction     VARCHAR2,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id       VARCHAR2/NUMBER,
cluster_id     NUMBER,
probability    NUMBER,
rank           INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id        VARCHAR2/NUMBER,
feature_id      NUMBER,
match_quality   NUMBER,
rank            INTEGER)
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if build data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```

```
 */

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name       => 'census_apply_result',
  case_id_column_name           => 'person_id',
  score_column_name             => 'prediction',
  score_criterion_column_name   => 'probability
  ranked_apply_result_tab_name  => 'census_ranked_apply_result',
  top_N                         => 3,
  cost_matrix_table_name        => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
  FROM census_ranked_apply_result;
```

RENAME_MODEL Procedure

This procedure renames a mining model to a specified new name.

Syntax

```
DBMS_DATA_MINING.RENAME_MODEL (
     model_name            IN VARCHAR2,
     new_model_name        IN VARCHAR2);
```

Parameters

Table 25–45 RENAME_MODEL Procedure Parameters

Parameter	Description
model_name	Old name of the model
new_model_name	New name of the model (See "Model Names" on page 25-5)

Usage Notes

You can use RENAME_MODEL to rename an existing mining model.

The behavior of the RENAME_MODEL is similar to a SQL DDL RENAME operation. It blocks DROP_MODEL and CREATE_MODEL operations. It does not block APPLY, which is a SQL query-like operation that does not update any model data.

If an APPLY operation is using a model, and you attempt to rename the model during that time, the RENAME will succeed and APPLY will return indeterminate results. This is in line with the conventional behavior in the RDBMS, where DDL operations do not block on query operations.

Examples

Assume the existence of a model census_model. The following example shows how to rename this model.

```
BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name      => 'census_model',
    new_model_name  => 'census_new_model');
END;
/
```

26

DBMS_DATA_MINING_TRANSFORM

The DBMS_DATA_MINING_TRANSFORM package contains a set of data transformation utilities that prepare data for data mining. Once you have prepared the data, you can use it to build and score models using the DBMS_DATA_MINING package or the Oracle Data Mining (ODM) Java API. You can also score models using the SQL scoring functions for data mining.

DBMS_DATA_MINING_TRANSFORM is an open-source PL/SQL package. You can use the routines in this package to prepare your data for data mining, or you can develop your own routines based on the public source code.

The source code, interface definitions, and inline documentation are available in $ORACLE_HOME/rdbms/admin/dbmsdmxf.sql.

See Also:

- Chapter 25, "DBMS_DATA_MINING". This package provides routines for building, scoring, exporting, and importing models. It also provides functions that return information about models.
- Chapter 72, "DBMS_PREDICTIVE_ANALYTICS". This package automates the entire process of predictive data mining, from data preprocessing through model building to scoring new data.
- *Oracle Data Mining Administrator's Guide* for information about sample data mining programs.
- *Oracle Data Mining Concepts* for Data Mining concepts.
- *Oracle Data Mining Application Developer's Guide* for information about developing data mining applications in SQL and Java.

This chapter contains the following topics:

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics which relate to using the `DBMS_DATA_MINING_TRANSFORM` package.

Overview

The DBMS_DATA_MINING_TRANSFORM package serves two purposes:

- It is a basic utility package for preprocessing data for data mining.
- It is an open-source learning tool that shows how to use SQL to perform common data transformations for data mining. The inputs and outputs for routines in this package are simple views and tables that are not Oracle proprietary. You can study the source code to help you create data transforms that are specific to your own application data. The source code for this package is in dbmsdmxf.sql in the rdbms/admin directory under $ORACLE_HOME.

Note: Use of the DBMS_DATA_MINING_TRANSFORM package is not required by Oracle Data Mining. You can develop your own preprocessing utilities or use third-party tools customized for your application.

The main principle behind the design of DBMS_DATA_MINING_TRANSFORM is the fact that SQL has enough power to perform most of the common mining transforms efficiently. For example, binning can be done using CASE expressions or DECODE functions, and linear normalization is a simple algebraic expression of the form (*x* - shift)/scale where *x* is the data value that is being transformed.

However, the queries that perform the transforms can be rather lengthy. So it is desirable to have some convenience routines that will help in generating queries. Thus, the goal of this package is to provide query generation services for the most common mining transforms, as well as to provide a framework that can be easily extended for implementing other transforms.

Note on Notation: This chapter uses standard interval notation for number sets:

- **[a,b]** is the set of all real numbers greater than or equal to **a** and less than or equal to **b**
- **[a,b)** is the set of all real numbers greater than or equal to **a** and less than **b**.

(b is in the set [a,b]; b is not in the set [a,b).)

Subscripts do not conform to standard notation; instead "X_N" is used for " X_N."

See Also: Sample data mining programs are available with Oracle Data Mining. These programs include sample data transformations using DBMS_DATA_MINING_TRANSFORM. Instructions for using the sample programs are provided in the *Oracle Data Mining Administrator's Guide*.

Types

Table 26–1 Summary of Data Types

Data Type	Purpose
`Column_List`	List of column names representing mining attributes, defined to be `VARRAY(1000)` of `VARCHAR2(32)`.

Transformation Methods

The DBMS_DATA_MINING_TRANSFORM package supports binning, normalization, winsorizing and clipping, and missing value transformations.

Binning

Binning involves mapping both continuous and discrete values to discrete values of reduced cardinality. For example, the age of persons can be binned into discrete numeric bins: 1-20 to 1, 21-40 to 2, and so on. Popular car manufacturers such as Ford, Chrysler, BMW, Volkswagen can be binned into discrete categorical bins: {Ford, Chrysler} to US_Car_Makers, and {BMW, Volkswagen} to European_Car_Makers.

DBMS_DATA_MINING_TRANSFORM supports binning for both categorical and numerical attributes. Categorical attributes have VARCHAR2/CHAR data types; numerical attributes have NUMBER data types.

Top-N Frequency Categorical Binning

The bin definition for each attribute is computed based on the occurrence frequency of values that are computed from the data. The user specifies a particular number of bins, say N. Each of the bins bin_1,..., bin_N corresponds to the values with top frequencies. The bin bin_N+1 corresponds to all remaining values.

Equi-Width Numerical Binning

The bin definition for each attribute is computed based on the minimum and maximum values that are computed from the data. The user specifies a particular number of bins, say N. Each of the bins bin_1,..., bin_N span ranges of equal width of size inc = (max – min)/N, bin_0 spans (–inf, min) and bin_(N+1) spans (max, + inf). When N is not specified, it can be estimated from the data.

Quantile Numerical Binning

The definition for each relevant column is computed based on the minimum values for each quantile, where quantiles are computed from the data using NTILE function. Bins bin_1,..., bin_N span the following ranges: bin_1 spans [min_1,min_2]; bin_2,..., bin_i,..., bin_N-1 span (min_i, min_(i+1)] and bin_N spans (min_N, max_N]. Bins with equal left and right boundaries are collapsed.

Normalization

Normalization involves scaling continuous values down to a specific range, such as [–1.0,1.0] or [0.0,1.0] such that `x_new = (x_old-shift)/scale`. Normalization applies only to numerical attributes.

Min-Max Normalization

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for `shift` and `scale` are `shift = min`, and `scale = (max - min)` respectively.

Scale Normalization

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for `shift` and `scale` are `shift = 0` and `scale = max{abs(max), abs(min)}`.

Z-Score Normalization

The normalization definition for each attribute is computed based on the values for mean and standard deviation that are computed from the data. The values for `shift`

and scale are computed to be shift = mean, and scale = standard deviation respectively.

Winsorizing and Trimming (Clipping)

Some computations on attribute values can be significantly affected by extreme values. One approach to achieving a more robust computation is to either Winsorize or trim the data as a preprocessing step.

Winsorizing involves setting the tail values of a particular attribute to some specified value. For example, for a 90% Winsorization, the bottom 5% are set equal to the minimum value in the 6th percentile, while the upper 5% are set equal to the value corresponding to the maximum value in the 95th percentile.

Trimming "removes" the tails in the sense that trimmed values are ignored in further values. This is achieved by setting the tails to NULL.

Missing Value Treatment

Missing Value treatment involves replacing NULL values in the data. Missing Value treatment is recommended when the fraction of missing values is high compared to the overall attribute value set. If the data contains relatively few missing values, you might choose to simply delete those records for the purpose of data mining.

If you want to replace missing values and you know or suspect what the values should be, you can use that knowledge to replace the NULLs. If you suspect that the NULLs may be random omissions, you can determine a meaningful value for them.

DBMS_DATA_MINING_TRANSFORM INSERT routines handle missing values by replacing NULLs in numerical attributes with the mean attribute value, and by replacing NULLs in categorical attributes with the mode.

Steps in Defining a Transformation

DBMS_DATA_MINING_TRANSFORM provides routines that define CREATE, INSERT, and XFORM operations. To define a data transformation, perform the following steps:

1. Use a CREATE routine to create a transformation definition table with a pre-defined set of columns.
2. Use an INSERT routine to populate the table with transformation definitions for selected attributes.
3. Use an XFORM routine to create a view of the transformation definition table.

Creating a Transformation Definition Table

Use the following procedures to create transformation definition tables:

- CREATE_BIN_NUM and CREATE_BIN_CAT to create bin definition tables.
- CREATE_NORM_LIN to create a normalization definition table.
- CREATE_CLIP to create a clipping definition table.
- CREATE_MISS_NUM and CREATE_MISS_CAT to create missing value treatment definition tables.

Usually, the consistency and integrity of transform definition tables is guaranteed by the creation process. Alternatively, it can be achieved by leveraging an integrity constraints mechanism. This can be done either by altering the tables created with CREATE routines, or by creating the tables manually with the necessary integrity constraints.

Defining a Transformation

The most common way of defining a transformation (populating the transformation definition tables) for each attribute is based on data inspection using some predefined methods (also known as automatic transform definition). Some of the most popular methods have been captured by the INSERT routines in DBMS_DATA_MINING_TRANSFORM. For example, the z-score normalization method estimates mean and standard deviation from the data to be used as a shift and scale parameters of the linear normalization transform.

Use the following procedures to populate the transformation definition tables:

- INSERT_BIN_NUM_EQWIDTH, INSERT_BIN_NUM_QTILE, and INSERT_AUTOBIN_NUM_EQWIDTH for binning numerical attributes, and INSERT_BIN_CAT_FREQ for binning categorical attributes.
- INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_SCALE, or INSERT_NORM_LIN_ZSCORE for normalizing numerical attributes.
- INSERT_CLIP_WINZOR_TAIL for winsorizing numerical attributes or INSERT_CLIP_TRIM_TAIL for clipping numerical attributes.
- INSERT_MISS_NUM_MEAN for missing value treatment of numerical attributes, and INSERT_MISS_CAT_MODE for missing value treatment of categorical attributes.

You can invoke these routines several times to transform all relevant attributes from various data sources until the definition table fully represents all mining attributes for a given problem.

After performing automatic transform definitions, some or all of the definitions can be adjusted by issuing SQL DML statements against the transform definition tables, thus providing virtually infinite flexibility in defining custom transforms.

The `INSERT` routines enable flexible transformation definitions in several ways:

- The data provided to the `INSERT` routines does not necessarily have to be the data used for a particular model creation. It can be any data that contains adequate representation of the mining attributes.
- The `INSERT` routines can be called any number of times against the same or different dataset until all the attributes have their transformations defined. You can selectively exclude one or more attributes for a particular iteration of the `INSERT`. In the most extreme case, each individual attribute can potentially have a unique transformation definition.
- You do not have to separately feed in numerical and categorical attributes, since categorical binning automatically skips over `NUMBER` columns in your table, and numerical binning, normalization, and clipping routines skip over `VARCHAR2/CHAR` columns in your input data.

Generating the Query for a Transform

Query generation is driven by the simple transform-specific definition tables with predefined columns. Query generation routines should be viewed as macros, and transformation definition tables as parameters used in macro expansions. Similar to using #define macros in the C language, the invoker is responsible for ensuring the correctness of the expanded macro, that is, that the result is a valid SQL query.

You can generate the views representing the transformation queries with the following procedures:

- `XFORM_BIN_NUM`, and `XFORM_BIN_CAT` for binning
- `XFORM_NORM_LIN` for normalization
- `XFORM_CLIP` for clipping
- `XFORM_MISS_NUM` and `XFORM_MISS_CAT` for missing value treatment

If your data contains a combination of numerical and categorical attributes, you must essentially feed the results of one transformation step to the next step. For example, the results of `XFORM_BIN_CAT` can be fed to `XFORM_BIN_NUM` or vice versa. The order is irrelevant since numerical and categorical transforms work on disjoint sets of attributes.

Sample Transformation

Given a dataset for a particular mining problem, any preprocessing and transformations on the mining data must be uniform across all mining operations. In other words, if the build data is preprocessed according to a particular transformation definition, then it follows that the test data and the scoring data must be preprocessed using the same definition.

The general usage of routines in this package can be explained using this example. Assume that your input table contains both numerical and categorical data that requires binning. A possible sequence of operations will be:

1. Invoke `CREATE_BIN_NUM` to generate an empty numerical bin definition table.
2. Invoke `INSERT_BIN_NUM_EQWIDTH` to define the transformations for all numerical attributes in the build data input. (For the sake of simplicity, let us assume that all numerical values are to be binned into 10 bins.) If you are binning for an O-Cluster model, use `INSERT_AUTOBIN_NUM_EQWIDTH`.
3. Next invoke `XFORM_BIN_NUM` with the numerical bin table and the build data table as inputs. The resulting object is a view that represents a SQL query against the build data table that performs numerical binning. Assume that you have named this result object `build_bin_num_view`.
4. Since you still have the categorical attributes to be binned, invoke `CREATE_BIN_CAT` to create a categorical bin definition table.
5. Next, invoke `INSERT_BIN_CAT_FREQ` to define the transforms for all categorical attributes. (For the sake of simplicity, let us assume that all categorical attributes are to be binned into 10 bins.)
6. As the final step, invoke `XFORM_BIN_CAT` with the categorical bin table and the view name provided by `XFORM_BIN_NUM`, namely `build_bin_num_view`, as the inputs. This essentially amounts to combining the transformations from both stages.
7. The object resulting from this operation is a view that represents a SQL query against your build data table, influenced by the contents of the bin definition tables. Provide this view name as the data input to the `CREATE_MODEL` procedure in the `DBMS_DATA_MINING` package.

If this happens to be a classification model, and you want to `APPLY` this model to scoring data, you must prepare the scoring data similar to the build data. You can achieve this in two simple steps:

1. First, call `XFORM_BIN_NUM` with the scoring data table and the numerical bin boundary table as inputs. The resulting object is a view that represents an SQL query against your scoring data table, influenced by the contents of the numerical bin boundary table. Assume that you have named this result object `apply_bin_num_view`.
2. As the next and final step, invoke `XFORM_BIN_CAT` with the categorical bin table and the view name provided by `XFORM_BIN_NUM`, namely `apply_bin_num_view`, as the inputs.
3. The object resulting from this operation is now a view that represents a SQL query against your scoring data table, influenced by the contents of the bin definition tables. Provide this view name as the data input to the `APPLY` procedure in the `DBMS_DATA_MINING` package.

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Table 26–2 DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
CREATE_BIN_CAT Procedure on page 26-12	Creates a categorical bin definition table
CREATE_BIN_NUM Procedure on page 26-13	Creates a numerical bin definition table
CREATE_CLIP Procedure on page 26-14	Creates a clipping definition table
CREATE_MISS_CAT Procedure on page 26-15	Creates a categorical missing value treatment definition table
CREATE_MISS_NUM Procedure on page 26-16	Creates a numerical missing value treatment definition table
CREATE_NORM_LIN Procedure on page 26-17	Creates a normalization definition table
INSERT_AUTOBIN_NUM_ EQWIDTH Procedure on page 26-18	Populates the numerical bin definition table, using the number of bins estimated from the data
INSERT_BIN_CAT_FREQ Procedure on page 26-20	Populates the categorical bin definition table, applying frequency-based binning to the categorical input data
INSERT_BIN_NUM_EQWIDTH Procedure on page 26-22	Populates the numerical bin definition table, applying equi-width binning to the numerical input data
INSERT_BIN_NUM_QTILE Procedure on page 26-24	Populates the numerical bin definition table, applying quantile binning to the numerical input data
INSERT_CLIP_TRIM_TAIL Procedure on page 26-26	Populates the clipping definition table, applying trimming based on tail fraction to the numerical input data
INSERT_CLIP_WINSOR_TAIL Procedure on page 26-28	Populates the clipping definition table, applying Winsorizing based on tail fraction to the numerical input data
INSERT_MISS_CAT_MODE Procedure on page 26-30	Populates the categorical missing value treatment definition table, applying the mode to each missing value
INSERT_MISS_NUM_MEAN Procedure on page 26-31	Populates the numerical missing value treatment definition table, applying the mean to each missing value
INSERT_NORM_LIN_MINMAX Procedure on page 26-32	Populates the normalization definition table, applying min-max normalization to the numerical input data
INSERT_NORM_LIN_SCALE Procedure on page 26-33	Populates the normalization definition table, applying scale normalization to the numerical input data
INSERT_NORM_LIN_ZSCORE Procedure on page 26-34	Populates the normalization definition table applying z-score normalization to the numerical input data
XFORM_BIN_CAT Procedure on page 26-35	Creates the view representing the transformed output with binned categorical data
XFORM_BIN_NUM Procedure on page 26-37	Creates the view representing the transformed output with binned numerical data
XFORM_CLIP Procedure on page 26-40	Creates the view representing the transformed output with clipped numerical data

Table 26–2 (Cont.) DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
XFORM_MISS_CAT Procedure on page 26-42	Creates the view representing the transformed output with categorical missing value treatment
XFORM_MISS_NUM Procedure on page 26-43	Creates the view representing the transformed output with numerical missing value treatment
XFORM_NORM_LIN Procedure on page 26-44	Creates the view representing the transformed output with normalized numerical data

CREATE_BIN_CAT Procedure

This procedure creates a categorical binning definition table. This table is used as input to the INSERT_BIN_CAT_FREQ and XFORM_BIN_CAT procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
     bin_table_name     IN VARCHAR2,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–3 CREATE_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
bin_schema_name	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
val	VARCHAR2(4000)
bin	VARCHAR2(4000)

Examples

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('build_bin_cat_table');
END;
```

CREATE_BIN_NUM Procedure

This procedure creates a numerical binning definition table. This table is used as input to the INSERT_BIN_NUM_EQWIDTH, INSERT_BIN_NUM_QTILE, INSERT_AUTOBIN_NUM_EQWIDTH, and XFORM_BIN_NUM procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
     bin_table_name    IN VARCHAR2,
     bin_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–4 CREATE_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
bin_schema_name	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
val	NUMBER
bin	VARCHAR2(4000)

Examples

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('build_bin_num_table');
END;
```

CREATE_CLIP Procedure

This procedure creates a clipping definition table. This table is used as input to the INSERT_CLIP_WINSOR_TAIL, INSERT_CLIP_TRIM_TAIL, and XFORM_CLIP procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
     clip_table_name    IN VARCHAR2,
     clip_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–5 CREATE_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table
clip_schema_name	Name of the schema hosting the clipping definition table

Usage Notes

The generated clipping definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
lcut	NUMBER
lval	NUMBER
rcut	NUMBER
rval	NUMBER

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('build_clip_table');
END;
```

CREATE_MISS_CAT Procedure

This procedure creates a categorical missing value treatment definition table. This table is used as input to the INSERT_MISS_CAT_MODE procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–6 CREATE_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table

Usage Notes

The generated categorical missing value treatment definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
val	VARCHAR2(4000)

Examples

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('build_miss_cat_table');
END;
```

CREATE_MISS_NUM Procedure

This procedure creates a numerical missing value treatment definition table. This table is used as input to the INSERT_MISS_NUM_MEAN procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–7 CREATE_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table
miss_schema_name	Name of the schema hosting the numeric missing value treatment definition table

Usage Notes

The generated numeric missing value definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
val	NUMBER

Example

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('build_miss_num_table');
END;
```

CREATE_NORM_LIN Procedure

This procedure creates a linear normalization definition table. This table is used as input to the INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_SCALE, INSERT_NORM_LIN_ZSCORE, and XFORM_NORM_LIN procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
     norm_table_name       IN VARCHAR2,
     norm_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–8 CREATE_NORMALIZE_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table
norm_schema_name	Name of the schema hosting the normalization definition table

Usage Notes

The generated linear normalization definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
shift	NUMBER
scale	NUMBER

Examples

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('build_norm_table');
END;
```

INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every numerical column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM. Based on the statistical information it collects on the input data, this procedure calculates the number of bins.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table.

N, the number of bins, is computed for each column separately and is based on the number of non-NULL values (cnt), the maximum (max), the minimum (min), the standard deviation (dev) and the constant C=3.49/0.9 as follows:

```
N=floor(power(cnt,1/3)*(max-min)/(c*dev))
```

Each of the bin_num (= N) bins bin_1,..., bin_N span ranges of equal width inc = (max – min) / N where bin_I = I when N > 0 or bin_I = N+1–I when N < 0, and bin_0 = bin_(N+1) = NULL. The values of the val column are rounded to round_num significant digits prior to scoring them in the definition table.

The parameter bin_num is used to adjust N to be at least bin_num. No adjustment is done when bin_num is NULL or 0. The parameter max_bin_num is used to adjust N to be at most max_bin_num. No adjustment is done when bin_num is NULL or 0. For columns with all integer values (discrete columns), N is adjusted to be at most the maximum number of distinct values in the observed range max-min+1.

The parameter sample_size is used to adjust cnt to be at most sample_size. No adjustment is done when sample_size is NULL or 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
     bin_table_name        IN VARCHAR2,
     data_table_name       IN VARCHAR2,
     bin_num               IN PLS_INTEGER DEFAULT 3,
     max_bin_num           IN PLS_INTEGER DEFAULT 100,
     exclude_list          IN Column_List DEFAULT NULL,
     round_num             IN PLS_INTEGER DEFAULT 6,
     sample_size           IN PLS_INTEGER DEFAULT 50000,
     bin_schema_name       IN VARCHAR2 DEFAULT NULL,
     data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–9 INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Minimum number of bins; default number is 3
max_bin_num	Maximum number of bins that sets the upper limit for estimates of bin numbers; default is 100

Table 26–9 (Cont.) INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process; categorical attributes are automatically excluded
round_num	Number of significant digits; default is 6
sample_size	Size of the data sample; default is 50,000
bin_schema_name	Name of the schema hosting the bin definition table; default is user schema
data_schema_name	Name of the schema hosting the table with data; default is user schema

Usage Notes

For a given input table, you can call this routine several times with different specifications for number of bins for a given input table. For each call, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. The sign of bin_num, max_bin_num, and sample_size have no effect on the result; absolute values are used. The value adjustment of N is done in the following order: First bin_num, next, max_bin_num, and, finally, discrete column adjustment.

Examples

The simplest invocation of this routine populates bin definitions in the num_bin_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQUIWIDTH(
      'num_bin_table', 'build_data_table');
END;
/
```

INSERT_BIN_CAT_FREQ Procedure

This procedure finds the categorical binning definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the categorical binning definition table created using CREATE_BIN_CAT.

Definition for each relevant column is computed based on the occurrence frequency of column values that are computed from the data table. Each of the bin_num(N) bins bin_1, ..., bin_N corresponds to the values with top frequencies when N > 0 or bottom frequencies when N < 0, and bin_(N+1) to all remaining values, where bin_I = I. Ordering ties among identical frequencies are broken by ordering on column values (ASC for N > 0 or DESC for N < 0). When the number of distinct values C < N only C+1 bins will be created.

The parameter default_num (D) is used for pruning based on the number of values that fall into the default bin. When D > 0 only columns that have at least D defaults are kept while others are ignored. When D < 0 only columns that have at most D values are kept. No pruning is done when D is NULL or D = 0. Parameter bin_support (SUP) is used for restricting bins to frequent (SUP > 0) values frq >= SUP*tot, or infrequent (SUP < 0) ones frq <= –SUP*tot, where frq is a given value count and tot is a sum of all counts as computed from the data. No support filtering is done when SUP is NULL or when SUP = 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     bin_num              IN PLS_INTEGER DEFAULT 9,
     exclude_list         IN Column_List DEFAULT NULL,
     default_num          IN PLS_INTEGER DEFAULT 2,
     bin_support          NUMBER DEFAULT NULL,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–10 INSERT_BIN_CAT_FREQ Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
default_num	Number of default values
bin_support	Bin support as a fraction
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the `exclude_list` parameter for a particular binning specification.

Columns with all `NULL`s are ignored. No bin definitions are populated when bin_num = 0, or bin_num, is `NULL`.

Examples

The simplest invocation of this routine populates bin definitions in the `cat_bin_table` for all the categorical attributes found in `build_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
      'cat_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table. Each of the bin_num (= N) bins bin_1,..., bin_N span ranges of equal width inc = (max – min) / N where bin_I = I when N > 0 or bin_I = N+1–I when N < 0, and bin_0 = bin_(N+1) = NULL.

The values of the val column in the bin definition table are rounded to round_num significant digits. For more information, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
     bin_table_name        IN VARCHAR2,
     data_table_name       IN VARCHAR2,
     bin_num               IN PLS_INTEGER DEFAULT 10,
     exclude_list          IN Column_List DEFAULT NULL,
     round_num             IN PLS_INTEGER DEFAULT 6,
     bin_schema_name       IN VARCHAR2 DEFAULT NULL,
     data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–11 INSERT_BIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
round_num	Number of significant digits. See Usage Notes.
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. No bin definitions are populated when bin_num = 0, or bin_num is NULL.

For example, when N=2, col='mycol', min=10, and max = 21, the following three rows are inserted into the definition table (inc = 5.5):

```
COL     VAL  BIN
----- -----  -----
mycol    10  NULL
```

```
 mycol  15.5  1
 mycol    21  2
```

The round_num parameter specifies how to round the number in the VAL column of the definition table. When round_num is positive, it specifies the most significant digits to retain. When round_num is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. When round_num is 0, the value is unchanged.

For example, a value of 308.162 would be rounded as follows.

```
For a value of 308.162:
     when round_num = 1       result is 300
     when round_num = 2       result is 310
     when round_num = 3       result is 308
     when round_num =  0      result is 308.162
     when round_num = -1      result is 308.16
     when round_num = -2      result is 308.2
     when round_num = NULL    result is NULL
```

Examples

The simplest invocation of this routine populates bin definitions in the num_bin_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
      'num_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_QTILE Procedure

This procedure finds a numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the binning definition table that was created using CREATE_BIN_NUM.

The definition for each relevant column is computed based on the minimum values for each quantile, where quantiles are computed from the data using NTILE function. Bins bin_1,..., bin_N span the following ranges: bin_1 spans [min_1,min_2]; bin_2,..., bin_i,..., bin_N-1 span (min_i, min_(i+1)] and bin_N spans (min_N, max_N]. Bins with equal left and right boundaries are collapsed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
    bin_table_name       IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    bin_num              IN PLS_INTEGER DEFAULT 10,
    exclude_list         IN Column_List DEFAULT NULL,
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–12 INSERT_BIN_NUM_QTILE Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using the CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
bin_schema_name	Name of the schema hosting the numerical binning definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for bin_num for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When N = 4, col='mycol', and data is {1,2,2,2,2,3,4}, the following three rows are inserted into the definition table:

```
COL     VAL   BIN
----- -----  -----
mycol     1   NULL
mycol     2   1
mycol     4   2
```

Here quantities are {1,2}, {2,2}, {2,3}, {4} and min(1) = 1, min(2) = 2, min(3) = 2, min(4) = 4, max(4) = 4, and ranges are [1,2], (2,2], (2,4], (4,4]. After collapsing [1,2] and (2,4].

Examples

The simplest invocation of this routine populates numerical binning definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE(
       'num_bin_table', 'build_table');
END;
```

INSERT_CLIP_TRIM_TAIL Procedure

This procedure finds the trimming definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

The definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that val(1) < val(2) <... < val(N), where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = NULL
rcut = val(N-floor(*N*q))
rval = NULL
```

where q = ABS(NVL(tail_frac,0)). Nothing is done when q >= 0.5.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    tail_frac           IN NUMBER DEFAULT 0.025,
    exclude_list        IN Column_List DEFAULT NULL,
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–13 INSERT_CLIP_TRIM_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using the CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

```
COL    LCUT   LVAL   RCUT   RVAL
----- -----  -----  -----  -----
mycol     2    NULL     4   NULL
```

Here 1 + floor(N*q) = 1 + floor(7*0.2) = 2, lcut = val(2) = 2.

N – floor(N*q) = 7 – floor(7*0.2) = 6, rcut = val(6) = 4.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL(
       'clip_table', 'build_table');
END;
```

INSERT_CLIP_WINSOR_TAIL Procedure

This procedure finds the Winsorizing definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

Definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that val(1) < val(2) <... < val(N), where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = lcut
rcut = val(N-floor(N*q))
rval = rcut
```

where q = ABS(NVL(tail_fraq,0)). Nothing is done when q >= 0.5.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
    clip_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    tail_frac          IN NUMBER DEFAULT 0.025,
    exclude_list       IN Column_List DEFAULT NULL,
    clip_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–14 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attribute (that is, column names using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

```
COL    LCUT   LVAL   RCUT  RVAL
----- -----  -----  ----- -----
mycol     2      2      4      4
```

Here 1 + floor(N*q) = 1 + floor(7*0.2) = 2, lcut = val(2) = 2.

N – floor(N*q) = 7 – floor(7*0.2) = 6, rcut = val(6) = 4.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL(
       'clip_table', 'build_table');
END;
```

INSERT_MISS_CAT_MODE Procedure

This procedure finds the categorical missing value treatment definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_CAT.

The definition for each selected column is computed based on the mode value that is computed from the data table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–15 INSERT_MISS_CAT_MODE Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the missing value treatment. See Table 26–1, " Summary of Data Types" for the definition of COLUMN_LIST.
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the categorical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mode (the most commonly occurring value) for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all categorical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
       'miss_table', 'build_table');
END;
```

INSERT_MISS_NUM_MEAN Procedure

This procedure finds the numerical missing value treatment definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_NUM.

The definition for each selected column is computed based on the mean value that is computed from the data table. The value of mean is rounded to round_num significant digits prior to storing it in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–16 INSERT_MISS_NUM_MEAN Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the miss value treatment. See Table 26–1, " Summary of Data Types" for the definition of COLUMN_LIST.
round_num	The number of significant digits
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the numerical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mean (average) value for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
       'miss_table', 'build_table');
END;
```

INSERT_NORM_LIN_MINMAX Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the mean and standard deviation that are computed from the data table, such that shift = mean and scale = standard deviation. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–17 INSERT_NORM_LIN_MINMAX Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_minmax_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX(
      'norm_minmax_table', 'build_table');
END;
```

INSERT_NORM_LIN_SCALE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are shift = 0 and scale = max{abs(max), abs(min)}.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–18 INSERT_NORM_LIN_SCALE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_minmax_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE(
      'norm_scale_table', 'build_table');
END;
```

INSERT_NORM_LIN_ZSCORE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on z-score normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table, such that shift = min and scale = max – min. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–19 INSERT_BIN_NORM_LIN_ZSCORE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_zscore_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE(
      'norm_zscore_table', 'build_table');
END;
/
```

XFORM_BIN_CAT Procedure

This procedure creates the view that performs categorical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     literal_flag         IN BOOLEAN DEFAULT FALSE,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–20 XFORM_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorized binning definition table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_CAT and populated with bin definitions by INSERT_BIN_CAT_FREQ is used to guide the query generation process to construct categorical binning expressions of the following form:

```
DECODE("col", val_1, bin_1,
              ...
              val_N, bin_N,
              NULL,   NULL,
              bin_(N+1)) "col"
```

This expression maps values val_1,..., val_N into N bins bin_1,..., bin_N, and other values into bin_(N+1), while NULL values remain unchanged. bin_(N+1) is optional. If not specified, it defaults to NULL. To specify bin_(N+1) provide a row with val set to NULL.

The literal_flag parameter indicates whether the values in bin are valid SQL literals. When the flag is set to TRUE, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Set `literal_flag` to TRUE when the data is binned for an O-Cluster model build.

The `col` parameter is case-sensitive since it generates quoted identifiers. In cases when there are multiple entries with the same `col`,`val` combination with different `bin`, the behavior is undefined — any one of the `bin` values might be used.

Examples

Example 1. bin_cat contains four rows with col = 'mycol':

```
{col = 'mycol', val = 'Waltham',        bin = 'MA'}
{col = 'mycol', val = 'Burlington',     bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
{col = 'mycol', val = NULL,             bin = 'OTHER'}
```

the following expression is generated:

```
 DECODE("mycol", 'Waltham',        'MA',
                 'Burlington',     'MA',
                 'Redwood Shores', 'CA',
                  NULL,             NULL,
                                   'OTHER') "mycol"
```

Example 2. bin_cat contains three rows with col = 'mycol':

```
{col = 'mycol', val = 'Waltham',        bin = 'MA'}
{col = 'mycol', val = 'Burlington',     bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
```

the following expression is generated:

```
DECODE("mycol", 'Waltham',        'MA',
                'Burlington',     'MA',
                'Redwood Shores', 'CA') "mycol"
```

Example 3. For the definition:

```
COL   VAL            BIN
----- ----------     ---
mycol Waltham        1
mycol Burlington     1
mycol Redwood Shores 2
```

the following expression is generated when the literal flag is set to FALSE:

```
DECODE ("mycol", 'Waltham',        '1',
                 'Burlington'      '1',
                 'Redwood Shores', '2') "mycol"
```

and when the flag is set to TRUE:

```
DECODE("mycol", 'Waltham',        1,
                'Burlington',     1,
                'Redwood Shores', 2) "mycol"
```

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on bin definitions in the cat_bin_table.

```
BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT(
'cat_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_BIN_NUM Procedure

This procedure creates the view that performs numerical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
     bin_table_name     IN VARCHAR2,
     data_table_name    IN VARCHAR2,
     xform_view_name    IN VARCHAR2,
     literal_flag       IN BOOLEAN DEFAULT FALSE,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name   IN VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–21 XFORM_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_NUM and populated with bin definitions by INSERT_BIN_NUM_EQWIDTH or INSERT_BIN_NUM_QTILE is used to guide the query generation process to construct numerical binning expressions of the following form:

```
CASE WHEN "col" <  val_0   THEN 'bin0_0
     WHEN "col" <= val_1   THEN 'bin_1'
     ...
     WHEN "col" <= val_N   THEN 'bin_N'
     WHEN "col" IS NOT NULL THEN 'bin_(N+1)'
END "col"
```

This expression maps values in the range [val_0;val_N] into N bins bin_1,..., bin_N, values outside of this range into bin_0 or bin_(N+1), such that

```
(-inf; val_0)  -> bin_0
[val_0; val_1)  -> bin_1
...
(val_(N-1); val_N] -> bin_N
(val_N; +inf)  -> bin_(N+1)
```

NULL values remain unchanged. bin_(N+1) is optional. If it is not specified, the values ("col" > val_N) are mapped to NULL. To specify bin_(N+1), provide a row with val set to NULL. The order of the WHEN... THEN pairs is based on the ascending order of val for a given col.

The literal_flag parameter indicates whether the values in bin are valid SQL literals. When the flag is set to TRUE, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Note that col is case-sensitive since it generates quoted identifiers. In cases where there are multiple entries with the same col,val combination with different bin, the behavior is undefined — any one of the bin values might be used.

Examples

Example 1. bin_num contains four rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = 'small'}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
{col = 'mycol', val = NULL, bin = 'huge'}
```

the following expression is generated:

```
CASE WHEN "mycol" <  10       THEN 'tiny'
     WHEN "mycol" <= 15.5     THEN 'small'
     WHEN "mycol" <= 20       THEN 'large'
     WHEN "mycol" IS NOT NULL THEN 'huge'
 END "mycol"
```

Example 2. bin_num contains three rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = NULL}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
```

the following expression is generated:

```
CASE WHEN "mycol" <  10   THEN NULL
     WHEN "mycol" <= 15.5 THEN 'small'
     WHEN "mycol" <= 20   THEN 'large'
END "mycol"
```

Example 3. For the definition:

```
COL   VAL  BIN
----- ---- ---
mycol   10 NULL
mycol 15.5 1
mycol   21 2
```

the following expression is generated when the literal flag is set to FALSE:

```
CASE WHEN "mycol" <  10   THEN NULL
     WHEN "mycol" <= 15.5 THEN '1'
     WHEN "mycol" <= 20   THEN '2'
 END "mycol"
```

and when the flag is set to TRUE:

```
CASE WHEN "mycol" <   10  THEN NULL
     WHEN "mycol" <= 15.5 THEN 1
     WHEN "mycol" <=  20  THEN 2
     END "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on transform definitions in bin definitions in the `num_bin_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM(
      'num_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_CLIP Procedure

This procedure creates the view that performs clipping. Only the columns that are specified in the transform definition are clipped; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
    clip_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    clip_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2,DEFAULT NULL,
    xform_schema_name     IN VARCHAR2,DEFAULT NULL;
```

Parameters

Table 26–22 XFORM_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The clipping definition table created by CREATE_CLIP and populated with clipping definitions by INSERT_CLIP_WINSOR_TAIL or INSERT_CLIP_TRIM_TAIL is used to guide query generation process to construct clipping expressions of the following form:

```
CASE WHEN "col" < lcut THEN lval
     WHEN "col" > rcut THEN rval
                       ELSE "col"
END "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

Example 1 (Winsorizing). When col = 'my_col', lcut = –1.5, lval = –1.5, and rcut = 4.5 and rval = 4.5, the following expression is generated:

```
CASE WHEN "my_col" < -1.5 THEN -1.5
     WHEN "my_col" >  4.5 THEN 4.5
                          ELSE "my_col"
END "my_col"
```

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in clipping definitions in the `clip_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP(
    'clip_table', 'build_table', 'build_view');
END;
```

XFORM_MISS_CAT Procedure

This procedure creates a view that performs categorical missing value treatment. Only the columns that are specified in the xform definition are treated; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 26–23 XFORM_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The data type of the transformed columns is preserved by putting a CAST expression around the NVL function. For example, when col = 'state', val = 'MA' the data type is CHAR(2) the following expression is generated:

```
CAST (NVL("state", 'MA') AS CHAR(2)) "state"
```

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT(
       'miss_table', 'build_table', 'build_view');
END;
```

XFORM_MISS_NUM Procedure

This procedure creates a view that performs numerical missing value treatment of the data table. Only the columns that are specified in the xform definition are treated, the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 26–24 XFORM_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table generated using CREATE_MISS_NUM
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM(
    'miss_table', 'build_table', 'build_view');
END;
```

XFORM_NORM_LIN Procedure

This procedure creates the view that performs linear normalization. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
     norm_table_name      IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     norm_schema_name     IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26–25 XFORM_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The normalization table created by CREATE_NORM_LIN is populated with definitions by either INSERT_NORM_LIN_ZSCORE or INSERT_NORM_LIN_MINMAX is used to guide the query generation process to construct normalization expressions of the following form:

```
("col" - shift)/scale "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

For example, when col = 'my_col', shift = -1.5, and scale = 20. The following expression is generated:

```
("my_col" - (-1.5))/20 "my_col"
```

Examples

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on normalization definitions in the norm_minmax_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN(
      'norm_minmax_table', 'build_table', 'build_view');
END;
```

DBMS_DATAPUMP

The DBMS_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

> **See Also:** *Oracle Database Utilities* for more information on the concepts behind the DBMS_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

Using DBMS_DATAPUMP

This section contains topics that relate to using the `DBMS_DATAPUMP` package.

Overview

The support and functionality provided by `DBMS_DATAPUMP` is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and datatypes existing in Oracle Database 10*g* are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The existing EXP_FULL_DATABASE and IMP_FULL_DATABASE roles will be used to allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

EXP_FULL_DATABASE

The EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the EXP_FULL_DATABASE role will also grant access to the SYS schema.

IMP_FULL_DATABASE

The IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the IMP_FULL_DATABASE role will also grant access to the SYS schema.

Constants

There are several public constants defined for use with the DBMS_DATAPUMP.GET_STATUS procedure. All such constants are defined as part of the DBMS_DATAPUMP package. Any references to these constants must be prefixed by DBMS_DATAPUMP. and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_STATUS_WIP CONSTANT BINARY_INTEGER := 1;
- KU$_STATUS_JOB_DESC CONSTANT BINARY_INTEGER := 2;
- KU$_STATUS_JOB_STATUS CONSTANT BINARY_INTEGER := 4;
- KU$_STATUS_JOB_ERROR CONSTANT BINARY_INTEGER := 8;

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_DUMPFILE_TYPE_DISK CONSTANT BINARY_INTEGER := 0;
- KU$_DUMPFILE_TYPE_TEMPLATE CONSTANT BINARY_INTEGER := 3;

Data Structures

The DBMS_DATAPUMP package defines OBJECT types. The types described in this section are defined in the SYS schema for use by the GET_STATUS function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the GET_STATUS procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10*g*, release 1 (10.1), there is a sys.ku$_Status1010 type, and in the next Oracle Database release, there could be a sys.ku$_Status1110 type defined. Both types could be used with the GET_STATUS procedure.

Public synonyms have been defined for each of the types used with the GET_STATUS procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym ku$_Status1010 is defined for the sys.ku$_Status1010 type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10*g*, release 1, the generic synonym ku$_Status is defined as ku$_Status1010. In a future release, there might be a ku$_Status1110 synonym for sys.ku$Status1110. Because the ku$_Status generic synonym always points to the latest definition, it would now point to ku$_Status1110 rather than to ku$_Status1010.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

Note: Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

See Also: GET_STATUS Procedure on page 27-23 for additional information about how types are used

Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The percent_done refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$_WorkerStatus1010 AS OBJECT (
               worker_number      NUMBER,
               process_name       VARCHAR2(30),
               state              VARCHAR2(30),
               schema             VARCHAR2(30),
               name               VARCHAR2(4000),
               object_type        VARCHAR2(200),
               partition          VARCHAR2(30),
               completed_objects  NUMBER,
               total_objects      NUMBER,
               completed_rows     NUMBER,
               completed_bytes    NUMBER,
               percent_done       NUMBER)

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1010
  FOR sys.ku$_WorkerStatus1010;

CREATE TYPE sys.ku$_WorkerStatus1020 AS OBJECT (
               worker_number     NUMBER,        --  Worker process identifier
               process_name      VARCHAR2(30),  --  Worker process name
               state             VARCHAR2(30),  --  Worker process state
               schema            VARCHAR2(30),  --  Schema name
               name              VARCHAR2(4000),--  Object name
               object_type       VARCHAR2(200), --  Object type
               partition         VARCHAR2(30),  --  Partition name
               completed_objects NUMBER,        --  Completed number of objects
               total_objects     NUMBER,        --  Total number of objects
               completed_rows    NUMBER,        --  Number of rows completed
               completed_bytes   NUMBER,        --  Number of bytes completed
               percent_done      NUMBER,        --  Percent done current object
               degree            NUMBER         --  Degree of parallelism)

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1020
  FOR sys.ku$_WorkerStatus1020;
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus FOR ku$_WorkerStatus1020;

CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010

CREATE TYPE sys.ku$_WorkerStatusList1020 AS TABLE OF sys.ku$_WorkerStatus1020

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1010
  FOR sys.ku$_WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1020
  FOR sys.ku$_WorkerStatusList1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
  FOR ku$_WorkerStatusList1020;
```

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to `NULL` for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```
CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
              logLineNumber   NUMBER,
              errorNumber     NUMBER,
              LogText         VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;
```

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```
CREATE TYPE sys.ku$_DumpFile1010 IS OBJECT (
              file_name          VARCHAR2(4000), -- Fully-qualified name
              file_type          NUMBER,         -- 0=Disk, 1=Pipe, etc.
              file_size          NUMBER,         -- Its length in bytes
              file_bytes_written NUMBER          -- Bytes written so far)

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1010 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1020 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile FOR ku$_DumpFile1010;

CREATE TYPE sys.ku$_DumpFileSet1010 AS TABLE OF sys.ku$_DumpFile1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1010 FOR
  sys.ku$_DumpFileSet1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1020 FOR
```

```
  sys.ku$_DumpFileSet1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR ku$_DumpFileSet1010;

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT (
               job_name            VARCHAR2(30),
               operation           VARCHAR2(30),
               job_mode            VARCHAR2(30),
               bytes_processed     NUMBER,
               percent_done        NUMBER,
               degree              NUMBER,
               error_count         NUMBER,
               state               VARCHAR2(30),
               phase               NUMBER,
               restart_count       NUMBER,
               worker_status_list  ku$_WorkerStatusList1010,
               files               ku$_DumpFileSet1010)

CREATE PUBLIC SYNONYM ku$_JobStatus1010 FOR
   sys.ku$_JobStatus1010;

CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT (
              job_name           VARCHAR2(30),             -- Name of the job
              operation          VARCHAR2(30),             -- Current operation
              job_mode           VARCHAR2(30),             -- Current mode
              bytes_processed    NUMBER,                   -- Bytes so far
              total_bytes        NUMBER,                   -- Total bytes for job
              percent_done       NUMBER,                   -- Percent done
              degree             NUMBER,                   -- Of job parallelism
              error_count        NUMBER,                   -- #errors so far
              state              VARCHAR2(30),             -- Current job state
              phase              NUMBER,                   -- Job phase
              restart_count      NUMBER,                   -- #Job restarts
              worker_status_list ku$_WorkerStatusList1020, -- job worker processes
              files              ku$_DumpFileSet1010       -- Dump file info)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1020 FOR   sys.ku$_JobStatus1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1020;
```

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```
CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT (

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1020;
```

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the `GET_STATUS` call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the ku$_LogEntry that is returned has already had its log lines ordered for proper output. That is, the original ku$_LogEntry objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 AS OBJECT
(
mask NUMBER,         /* Indicates which status types are present*/
wip ku$_LogEntry1010,  /* Work-In-Progress: std. exp/imp msgs */
job_description    ku$_JobDesc1010,   /* Complete job description */
job_status         ku$_JobStatus1010, /* Detailed job status + per-worker sts */
error              ku$_LogEntry1010   /* Multi-level contextual errors */
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
        (
               mask             NUMBER,            -- Status types present
               wip              ku$_LogEntry1010,  -- Work in progress
               job_description  ku$_JobDesc1020,   -- Complete job description
               job_status       ku$_JobStatus1020, -- Detailed job status
               error            ku$_LogEntry1010   -- Multi-level context errors
        )

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status FOR ku$_Status1020;
```

Summary of DBMS_DATAPUMP Subprograms

Table 27–1 DBMS_DATAPUMP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 27-13	Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the `FILETYPE` parameter provided with this procedure
ATTACH Function on page 27-16	Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state
DATA_FILTER Procedures on page 27-18	Specifies restrictions on the rows that are to be retrieved
DETACH Procedure on page 27-20	Specifies that the user has no further interest in using the handle
GET_DUMPFILE_INFO Procedure on page 27-21	Monitors the status of a job or waits for the completion of a job.
GET_STATUS Procedure on page 27-23	Monitors the status of a job or waits for the completion of a job or for more details on API errors
LOG_ENTRY Procedure on page 27-26	Inserts a message into the log file
METADATA_FILTER Procedure on page 27-27	Provides filters that allow you to restrict the items that are included in a job
METADATA_REMAP Procedure on page 27-30	Specifies a remapping to be applied to objects as they are processed in the specified job
METADATA_TRANSFORM Procedure on page 27-32	Specifies transformations to be applied to objects as they are processed in the specified job
OPEN Function on page 27-35	Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures except `ATTACH`
SET_PARALLEL Procedure on page 27-38	Adjusts the degree of parallelism within a job
SET_PARAMETER Procedures on page 27-40	Specifies job-processing options
START_JOB Procedure on page 27-44	Begins or resumes execution of a job
STOP_JOB Procedure on page 27-46	Terminates a job, but optionally, preserves the state of the job
WAIT_FOR_JOB Procedure on page 27-48	Runs a job until it either completes normally or stops for some other reason.

ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (
   handle     IN NUMBER,
   filename   IN VARCHAR2,
   directory  IN VARCHAR2,
   filesize   IN VARCHAR2 DEFAULT NULL,
   filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE);
```

Parameters

Table 27–2 ADD_FILE Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
filename	The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable, %U, which indicates that multiple files may be generated with the specified filename as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity. Any % in a filename must be followed by either a % or a U.
directory	The name of a directory object within the database that is used to locate filename. A directory must be specified. See the Data Pump Export chapter in *Oracle Database Utilities* for information about the DIRECTORY command-line parameter.
filesize	The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. filesize may only be specified for dump files.
filetype	The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP.: ■ KU$_FILE_TYPE_DUMP_FILE (dump file for a job) ■ KU$_FILE_TYPE_LOG_FILE (log file for a job) ■ KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- INVALID_STATE. The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- FILE_ERROR. Oracle does not have the requested operating system access to the specified file or the file has already been specified for the current operation.
- INVALID_OPERATION. A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and SQL_FILE operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the SET_PARALLEL procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (%U) is included in a filename, multiple dump files may be specified through a single call to ADD_FILE. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current SET_PARALLEL value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple ADD_FILEs with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if expa%U, expb%U and expc%U were all specified for a job having a parallelism of 6, the initial dump files created would look like: expa01, expb01, expc01, expa02, expb02, and expc02.
- If presented with dump file specifications, expa%U, expb%U and expc%U, an Import or SQL_FILE operation will begin by attempting to open the dump files, expa01, expb01, and expc01. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, expa02, expb02, and expc02). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of

the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.

ATTACH Function

This function gains access to a previously-created job.

Syntax

```
DBMS_DATAPUMP.ATTACH(
   job_name    IN VARCHAR2 DEFAULT NULL,
   job_owner    IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 27–3 ATTACH Function Parameters

Parameter	Description
job_name	The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).
job_owner	The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the EXP_FULL_DATABASE role (for export operations) or the IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.

- If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.

DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.DATA_FILTER(
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–4 DATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle that is returned from the OPEN procedure.
name	The name of the filter.
value	The value of the filter.
table_name	The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.
schema_name	The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.

Exceptions

- INVALID_ARGVAL. There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is TRANSPORTABLE, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of schema_name and table_name
- INVALID_STATE. The user called DATA_FILTER when the job was not in the Defining state.
- INCONSISTENT_ARGS. The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- PRIVILEGE_ERROR. A schema name was supplied, but the user did not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.

- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

  With the exception of the INCLUDE_ROWS filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

  The available data filters are described in Table 27–5.

Table 27–5 Data Filters

Name	Datatype	Operations that Support Filter	Description
INCLUDE_ ROWS	NUMBER	EXPORT, IMPORT	If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.
PARTITION_ EXPR PARTITION_ LIST	text	EXPORT, IMPORT	For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for PARTITION_EXPR) or are included in the list (for PARTITION_LIST). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. PARTITION_EXPR is not supported on jobs across a network link. Default=All partitions are processed.
SAMPLE	NUMBER	EXPORT, IMPORT	For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.
SUBQUERY	text	EXPORT, IMPORT	Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.

DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH(
   handle  IN NUMBER);
```

Parameters

Table 27–6 DETACH Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.

GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
   filename    IN VARCHAR2,
   directory   IN VARCHAR2,
   info_table  OUT ku$_dumpfile_info,
   filetype    OUT NUMBER);
```

Parameters

Table 27–7 GET_DUMPFILE_INFO Procedure Parameters

Parameter	Description
filename	A simple filename with no directory path information.
directory	A directory object that specifies where the file can be found.
info_table	A PL/SQL table for storing information about the dump file.
filetype	The type of file (Data Pump dump file, original Export dump file, or unknown).

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of zero will be returned and the dump file info_table will remain empty.

A filetype value of one indicates a Data Pump dump file. A file type value of two indicates an original Export dump file. In both cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
               item_code       NUMBER,           -- Identifies header item
               value           VARCHAR2(2048)    -- Text string value)
/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item
/
```

```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as follows (prepended with the package name, `DBMS_DATAPUMP.`):

```
KU$_DFHDR_FILE_VERSION         CONSTANT NUMBER := 1;
KU$_DFHDR_MASTER_PRESENT       CONSTANT NUMBER := 2;
KU$_DFHDR_GUID                 CONSTANT NUMBER := 3;
KU$_DFHDR_FILE_NUMBER          CONSTANT NUMBER := 4;
KU$_DFHDR_CHARSET_ID           CONSTANT NUMBER := 5;
KU$_DFHDR_CREATION_DATE        CONSTANT NUMBER := 6;
KU$_DFHDR_FLAGS                CONSTANT NUMBER := 7;
KU$_DFHDR_JOB_NAME             CONSTANT NUMBER := 8;
KU$_DFHDR_PLATFORM             CONSTANT NUMBER := 9;
KU$_DFHDR_INSTANCE             CONSTANT NUMBER := 10;
KU$_DFHDR_LANGUAGE             CONSTANT NUMBER := 11;
KU$_DFHDR_BLOCKSIZE            CONSTANT NUMBER := 12;
KU$_DFHDR_DIRPATH              CONSTANT NUMBER := 13;
KU$_DFHDR_METADATA_COMPRESSED  CONSTANT NUMBER := 14;
KU$_DFHDR_DB_VERSION           CONSTANT NUMBER := 15;
KU$_DFHDR_MAX_ITEM_CODE        CONSTANT NUMBER := 15;
```

GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```
DBMS_DATAPUMP.GET_STATUS(
   handle    IN NUMBER,
   mask      IN BINARY_INTEGER,
   timeout   IN NUMBER DEFAULT NULL,
   job_state OUT VARCHAR2,
   status    OUT ku$_Status1010);
```

Parameters

Table 27–8 GET_STATUS Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. A null handle can be used to retrieve error information after OPEN and ATTACH failures.
mask	A bit mask that indicates which of four types of information to return: ■ KU$_STATUS_WIP ■ KU$_STATUS_JOB_DESC ■ KU$_STATUS_JOB_STATUS ■ KU$_STATUS_JOB_ERROR Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 27-7.
timeout	Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.
job_state	Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status structure.
status	A ku$_Status is returned. The ku$_Status mask indicates what kind of information is included. This could be none if only KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and the timeout period expires. This can be a ku$_Status1010 or ku$_Status1020 object type.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The GET_STATUS procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The KU$_STATUS_JOB_DESC and KU$_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the job_state returned by GET_STATUS does not indicate a terminating job, it is possible that the job could still terminate before the next call to GET_STATUS. This would result in an INVALID_HANDLE exception. Alternatively, the job could terminate during the call to GET_STATUS, which would result in a NO_SUCH_JOB exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the GET_STATUS procedure:

- Errors resulting from other procedure calls: For example, the SET_PARAMETER procedure may produce an INCONSISTENT_ARGS exception. The client should immediately call GET_STATUS with mask=8 (errors) and timeout=0. The returned ku$_Status.error will contain a ku$_LogEntry that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The ku$_Status.error will contain a ku$_LogEntry with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to GET_STATUS with an infinite timeout (-1) "listening" for KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages. If status was requested, then JOB_STATUS information will also be in the request.

When the ku$_Status is interpreted, the following guidelines should be used:

- ku$_Status.ku$_JobStatus.percent_done refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - EXPORT or network IMPORT--(bytes_processed/estimated_bytes) * 100
  - IMPORT--(bytes_processed/total_expected_bytes) * 100
  - SQL_FILE or estimate-only EXPORT--0.00 if not done or 100.00 if done

  The effects of the QUERY and PARTITION_EXPR data filters are not considered in computing percent_done.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

```
((SYSDATE - start time) / ku$_Status.ku$_JobStatus.percent_done) * 100
```

- The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY(
   handle         IN NUMBER,
   message        IN VARCHAR2
   log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

Table 27–9 LOG_ENTRY Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
message	A text line to be added to the log file.
log_file_only	Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If log_file_only is zero (the default), the message is also broadcast as a KU$_STATUS_WIP message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string, ";;; "

METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2,
   object_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–10 METADATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from the OPEN procedure.
name	The name of the filter. See Table 27–11 for descriptions of the available filters.
value	The value of the filter.
object_path	The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.

Table 27–11 describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

Table 27–11 Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
NAME_EXPR NAME_LIST	Named objects	Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.
SCHEMA_EXPR SCHEMA_LIST	Schema objects	Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (''SCOTT'')'). For Schema mode, identifies which users are to be processed.

Table 27–11 (Cont.) Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
TABLESPACE_EXPR	TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT	Restricts the job to objects stored in a tablespace whose name is satisfied by the expression.
TABLESPACE_LIST		For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.
INCLUDE_PATH_EXPR INCLUDE_PATH_LIST EXCLUDE_PATH_EXPR EXCLUDE_PATH_LIST	All	Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
  - The specified object_path is not supported for the current mode.
  - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter, grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.
- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:

  - NAME_EXPR
  - SCHEMA_EXPR
  - TABLESPACE_EXPR
  - INCLUDE_PATH_EXPR
  - EXCLUDE_PATH_EXPR

  The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:

  - NAME_LIST
  - SCHEMA_LIST
  - TABLESPACE_LIST
  - INCLUDE_PATH_LIST
  - EXCLUDE_PATH_LIST

- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying `NAME_EXPR as '!=''EMP'''` and `NAME_EXPR as '!=''DEPT'''` on a Table mode export would produce a file set containing all of the tables except for `EMP` and `DEPT`.

METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   old_value   IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–12 METADATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the remap. See Table 27–13 for descriptions of the available remaps.
old_value	Specifies which value in the dump file set should be reset to value.
value	The value of the parameter for the remap. This signifies the new value that old_value should be translated into.
object_type	Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.

Table 27–13 describes the remaps provided by the METADATA_REMAP procedure.

Table 27–13 Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_SCHEMA	Text	Schema objects	Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE's objects to SCOTT, but SCOTT cannot remap SCOTT's objects to BLAKE.

Table 27–13 (Cont.) Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_TABLESPACE	Text	TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG,TABLE_SPACE	Any storage segment in the job that matches the object_type parameter and was located in the old_value tablespace will be relocated to the value tablespace.
REMAP_DATAFILE	Text	LIBRARY, TABLESPACE, DIRECTORY	Any datafile reference in the job that matches the object_type parameter and referenced the old_value datafile will be redefined to use the value datafile.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The job's mode does not include the specified object_type.
  - The remap has already been specified for the specified old_value and object_type.
- INVALID_OPERATION. Remaps are only supported for SQL_FILE and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- INVALID_STATE. The user called METADATA_REMAP after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the remap.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_REMAP procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.
- Transforms for the DataPump API are a subset of the remaps implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 27–14 METADATA_TRANSFORM Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN procedure.
name	The name of the transformation. See Table 27–15 for descriptions of the available transforms.
value	The value of the parameter for the transform.
object_type	Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.

Table 27–15 describes the transforms provided by the METADATA_TRANSFORM procedure.

Table 27–15 Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
PCTSPACE	NUMBER	TABLE INDEX TABLESPACE	Specifies a percentage multiplier used to alter extent allocations and datafile sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.
SEGMENT_ATTRIBUTES	NUMBER	TABLE, INDEX	If nonzero (TRUE), emit storage segment parameters. Defaults to 1.

Table 27–15 (Cont.) Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
STORAGE	NUMBER	TABLE	If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).
OID	NUMBER	TYPE TABLE	If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique

according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures except ATTACH.

Syntax

```
DBMS_DATAPUMP.OPEN (
   operation    IN VARCHAR2,
   mode         IN VARCHAR2,
   remote_link  IN VARCHAR2 DEFAULT NULL,
   job_name     IN VARCHAR2 DEFAULT NULL,
   version      IN VARCHAR2 DEFAULT 'COMPATIBLE'
   compression  IN NUMBER DEFAULT KU$_COMPRESS_METADATA)
 RETURN NUMBER;
```

Parameters

Table 27–16 OPEN Function Parameters

Parameter	Meaning
operation	The type of operation to be performed. Table 27–17 contains descriptions of valid operation types.
mode	The scope of the operation to be performed. Table 27–18 contains descriptions of valid modes. Specifying NULL generates an error.
remote_link	If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.
job_name	The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN procedure and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: "SYS_<OPERATION>_<MODE>_%N". The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, "SYS_IMPORT_FULL_03"). The name supplied for the job will also be used to name the master table and other resources associated with the job.
version	The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: ■ COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. ■ LATEST - the version of the metadata corresponds to the database version. ■ A specific database version, for example, '10.0.0'. In Oracle Database10*g*, this value cannot be lower than 10.0.0.

Table 27–16 (Cont.) OPEN Function Parameters

Parameter	Meaning
compression	The type of compression to use for an export job. The supported compression types are ku$_compress_metadata (which is the default) and ku$_compress_none.

Table 27–17 describes the valid operation types for the OPEN Function.

Table 27–17 Valid Operation Types for the OPEN Function

Operation	Description
EXPORT	Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.
IMPORT	Restores data and metadata from a dump file set or across a database link.
SQL_FILE	Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.

Table 27–18 describes the valid modes for the OPEN procedure.

Table 27–18 Valid Modes for the OPEN Function

Mode	Description
FULL	Operates on the full database or full dump file set except for the SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, and LBACSYS schemas.
SCHEMA	Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS schemas for this mode.
TABLE	Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.
TABLESPACE	Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.
TRANSPORTABLE	Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB

Exceptions

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- JOB_EXISTS. A table already exists with the specified job name.
- PRIVILEGE_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL_ERROR. The job was created under the wrong schema or the master table was of the wrong format.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the ATTACH procedure.
- If the OPEN fails, call GET_STATUS with a null handle to retrieve additional information about the failure.

SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
   handle      IN NUMBER,
   degree      IN NUMBER);
```

Parameters

Table 27–19 SET_PARALLEL Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call.
degree	The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_OPERATION. The SET_PARALLEL procedure is only valid for export and import operations.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of *n*, the user should supply *n* files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

- SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```
DBMS_DATAPUMP.SET_PARAMETER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER);
```

Parameters

Table 27–20 SET_PARAMETER Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN call.
name	The name of the parameter. Table 27–21 describes the valid parameter names.
value	The value for the specified parameter.

Table 27–21 describes the valid options for the name parameter of the SET_PARAMETER procedure.

Table 27–21 Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
CLIENT_COMMAND	Text	All	An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.
ESTIMATE	Text	Export and Import	Specifies that the estimate method for the size of the tables should be performed before starting the job. If BLOCKS, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables. If STATISTICS, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using BLOCKS. The ESTIMATE parameter cannot be used in Transportable Tablespace mode. Default=BLOCKS.
ESTIMATE_ONLY	Number	Export	Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.

Table 27–21 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
FLASHBACK_SCN	NUMBER	Export and network Import	System change number (SCN) to serve as transactionally consistent point for reading user data. If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. FLASHBACK_SCN is not supported in Transportable mode.
FLASHBACK_ TIME	Text	Export and network Import	Either the date and time used to determine a consistent point for reading user data or a string of the form TO_ TIMESTAMP(...).
			If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions.
			FLASHBACK_SCN and FLASHBACK_TIME cannot both be specified for the same job. FLASHBACK_TIME is not supported in Transportable mode.
INCLUDE_ METADATA	NUMBER	Export and Import	If nonzero, metadata for objects will be moved in addition to user table data.
			If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data.
			INCLUDE_METADATA is not supported in Transportable mode.
			Default=1.
REUSE_ DATAFILES	NUMBER	Import	If nonzero, tablespace data files can be created using preexisting data files for tablespace creations. REUSE_ DATAFILES is only supported in Full mode.
			Default=0
SKIP_ UNUSABLE_ INDEXES	NUMBER	Import	If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode.
			Default=1

Table 27–21 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
TABLE_EXISTS_ACTION	Text	Import	Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP. If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported. If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import. Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE. If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped. If APPEND, new rows are added to the existing rows in the table. If SKIP, the preexisting table is left unchanged. TABLE_EXISTS_ACTION is not supported in Transportable mode. The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.
TABLESPACE_DATAFILE	Text	Import	Specifies the full file specification for a datafile in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports. TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.
TTS_FULL_CHECK	NUMBER	Export	If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports. Default=0.
USER_METADATA	NUMBER	Export and network Import	For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter. The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode. Default=1 if user has EXP_FULL_DATABASE role; 0 otherwise.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
  - The supplied value was not allowed for the specified parameter name

  - A flashback parameter had been established after a different flashback parameter had already been established
  - A parameter was specified that did not support duplicate definitions
- INVALID_OPERATION. The operation specified is invalid in this context.
- INVALID_STATE. The specified job is not in the Defining state.
- INCONSISTENT_ARGS. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- PRIVILEGE_ERROR. The user does not have the EXP_FULL_DATABASE or IMP_FULL_DATABASE role required for the specified parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARAMETER procedure is used to specify optional features for the current job. See Table 27–21 for a list of supported options.

START_JOB Procedure

This procedure begins or resumes execution of a job.

Syntax

```
DBMS_DATAPUMP.START_JOB (
   handle       IN NUMBER,
   skip_current IN NUMBER DEFAULT 0);
```

Parameters

Table 27–22 START_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through either the OPEN or ATTACH procedure.
skip_ current	If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. skip_ current is ignored for the initial START_JOB in a job. If zero, no data or metadata is lost upon a restart.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL_FILE job
  - An ADD_FILE procedure has not been called to define the output for a SQL_ FILE job
  - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
  - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
  - The dump file set on an Import of SQL_FILE job was either incomplete or missing a master table specification
- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the SET_PARALLEL procedure was not called prior to the START_JOB procedure, the initial level of parallelism used in the job will be 1. If SET_PARALLEL was called prior to the job starting, the degree specified by the last SET_PARALLEL call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another SET_PARALLEL call.
- To restart a stopped job, an ATTACH must be performed prior to executing the START_JOB procedure.

STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```
DBMS_DATAPUMP.STOP_JOB (
   handle      IN NUMBER,
   immediate   IN NUMBER DEFAULT 0,
   keep_master IN NUMBER DEFAULT NULL,
   delay       IN NUMBER DEFAULT 0);
```

Parameters

Table 27–23 STOP_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
immediate	If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.
keep_master	If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.
delay	The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID STATE. The job is already in the process of being stopped or completed.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (
  handle      IN   NUMBER,
  job_state   OUT  VARCHAR2);
```

Parameters

Table 27–24 WAIT_FOR_JOB Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through an OPEN or ATTACH call. At the end of the procedure, the user is detached from the handle.
job_state	The state of the job when it has stopped executing. This will be either Stopped or Completed.

Exceptions

- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.
- INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be Completed. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be Stopped.

28

DBMS_DB_VERSION

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

> **See Also:** *PL/SQL Users Guide and Reference* regarding conditional compilation

This package contains the following topics

- Using DBMS_DB_VERSION
  - Overview
  - Constants
  - Examples

Using DBMS_DB_VERSION

Overview

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 10g Release 2 version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
   VERSION CONSTANT PLS_INTEGER := 10; -- RDBMS version number
   RELEASE CONSTANT PLS_INTEGER := 2;  -- RDBMS release number
   ver_le_9_1    CONSTANT BOOLEAN := FALSE;
   ver_le_9_2    CONSTANT BOOLEAN := FALSE;
   ver_le_9      CONSTANT BOOLEAN := FALSE;
   ver_le_10_1   CONSTANT BOOLEAN := FALSE;
   ver_le_10_2   CONSTANT BOOLEAN := TRUE;
   ver_le_10     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- VER_LE_9_1 represents version <= 9 and release <= 1
- VER_LE_10_2 represents version <= 10 and release <= 2
- VER_LE_10 represents version <= 10

A typical usage of these boolean constants is:

```
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
   version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
   version 11 code
$ELSE
   version 12 and later code
$END
```

This code structure will protect any reference to the code for hypothetical version 12. It also prevents the controlling package constant DBMS_DB_VERSION.VER_LE_11 from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant VER_LE_11 is not defined in version 10 database because conditional compilation protects the $ELSIF from evaluation if DBMS_DB_VERSION.VER_LE_10 is TRUE.

Constants

The DBMS_DB_VERSION package contains different constants for different Oracle Database releases. The Oracle Database 10g Release 2 version of the DBMS_DB_VERSION package uses the constants shown in Table 28–1.

Table 28–1 DBMS_DB_VERSION Constants

Name	Type	Value	Description
VERSION	PLS_INTEGER	10	Current version
RELEASE	PLS_INTEGER	2	Current release
VER_LE_9	BOOLEAN	FALSE	Version <= 9
VER_LE_9_1	BOOLEAN	FALSE	Version <= 9 and release <= 1
VER_LE_9_2	BOOLEAN	FALSE	Version <= 9 and release <= 2
VER_LE_10	BOOLEAN	TRUE	Version <= 10
VER_LE_10_1	BOOLEAN	FALSE	Version <= 10 and release <= 1
VER_LE_10_2	BOOLEAN	TRUE	Version <=10 and release <= 2

Examples

This example uses conditional compilation to guard new features.

```
CREATE OR REPLACE PROCEDURE whetstone IS

 -- Notice that conditional compilation constructs
 -- can interrupt a regular PL/SQL statement.
 -- You can locate a conditional compilation directive anywhere
 -- there is whitespace in the regular statement.

 SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
                                 $ELSE BINARY_DOUBLE
    $END;

 t  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
                                                     $ELSE 0.499975d
                        $END;

 t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
                                                     $ELSE 2.0d
                        $END;

 x  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 y  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 z  MY_REAL;

 PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
   x1 my_real;
   y1 my_real;
 BEGIN
   x1 := x;
   y1 := y;
   x1 := t * (x1 + y1);
   y1 := t * (x1 + y1);
   z := (x1 + y1)/t2;
 END P;
BEGIN
 P(x, y, z);
 DBMS_OUTPUT.PUT_LINE ('z = '|| z);
END whetstone;
/
```

29

DBMS_DDL

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

Using DBMS_DDL

This section contains topics which relate to using the `DBMS_DDL` package.

Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Release 10gR2:

- ALTER_COMPILE Procedure

Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

Summary of DBMS_DDL Subprograms

Table 29–1 DBMS_DDL Package Subprograms

Subprogram	Description
ALTER_COMPILE Procedure on page 29-7	Compiles the PL/SQL object
ALTER_TABLE_NOT_ REFERENCEABLE Procedure on page 29-8	Reorganizes object tables
ALTER_TABLE_REFERENCEABLE Procedure on page 29-9	Reorganizes object tables
CREATE_WRAPPED Procedures on page 29-10	Takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a `CREATE OR REPLACE` statement with the PL/SQL source text obfuscated and executes the generated statement
IS_TRIGGER_FIRE_ONCE Function on page 29-12	Returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, returns `FALSE`
SET_TRIGGER_FIRING_PROPERTY Procedure on page 29-13	Sets the specified DML or DDL trigger's firing property
WRAP Functions on page 29-14	Takes as input a `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a `CREATE OR REPLACE` statement where the text of the PL/SQL unit has been obfuscated

ALTER_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

> **Note:** This procedure is deprecated in Release 10gR2. While the procedure remains available in the package, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```
DBMS_DDL.ALTER_COMPILE (
   type             VARCHAR2,
   schema           VARCHAR2,
   name             VARCHAR2
   reuse_settings   BOOLEAN := FALSE);
```

Parameters

Table 29–2 ALTER_COMPILE Procedure Parameters

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 29–3 ALTER_COMPILE Procedure Exceptions

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
   table_name        IN           VARCHAR2,
   table_schema      IN  DEFAULT  NULL,
   affected_schema   IN  DEFAULT  NULL);
```

Parameters

Table 29–4 ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	The name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	The name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for `PUBLIC`; that is., it simply undoes the previous `ALTER_TABLE_REFERENCEABLE` call for this specific schema. The affected schema must a particular schema (cannot be `PUBLIC`).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has `ALTER ANY TABLE` and `SELECT ANY TABLE` and `DROP ANY TABLE` privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name>  REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
   table_name       IN  VARCHAR2,
   table_schema     IN  DEFAULT  NULL,
   affected_schema  IN  DEFAULT  NULL);
```

Parameters

Table 29–5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	The name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	The name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	The name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same `EOID`; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it will make the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

CREATE_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

See Also: WRAP Functions on page 29-14

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual WRAP Functions and DBMS_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of syntax is presented with the definition.

Syntax

Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(*ddl*):

```
DBMS_DDL.CREATE_WRAPPED (
   ddl     VARCHAR2);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2A,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2S,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Parameters

Table 29–6 CREATE_WRAPPED Procedure Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name

DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

IS_TRIGGER_FIRE_ONCE Function

This function returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, it returns `FALSE`.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package

---

Note: Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: "SET_TRIGGER_FIRING_PROPERTY Procedure" on page 29-13

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
   trig_owner          IN  VARCHAR2,
   trig_name           IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 29–7 IS_TRIGGER_FIRE_ONCE Function Parameters

Parameter	Description
`trig_owner`	Schema of trigger
`trig_name`	Name of trigger

SET_TRIGGER_FIRING_PROPERTY Procedure

This procedure sets the specified DML or DDL trigger's firing property. Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package.

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY
   trig_owner         IN  VARCHAR2,
   trig_name          IN  VARCHAR2,
   fire_once          IN  BOOLEAN);
```

Parameters

Table 29–8 SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

Parameter	Description
`trig_owner`	Schema of the trigger to set
`trig_name`	Name of the trigger to set
`fire_once`	If `TRUE`, the trigger is set to fire once. By default, the `fire_once` parameter is set to `TRUE` for DML and DDL triggers. If `FALSE`, the trigger is set to always fire.

Usage Notes

You can specify one of the following settings for a trigger's firing property:

- If the `fire_once` parameter is set to `TRUE` for a trigger, then the trigger does not fire for these types of changes.
- If the `fire_once` parameter is set to `FALSE` for a trigger, then the trigger fires for these types of changes.

Regardless of the firing property set by this procedure, a trigger continues to fire when changes are made by means other than the apply process or apply error execution. For example, if a user session or an application makes a change, then the trigger continues to fire, regardless of the firing property.

Note:

- If you dequeue an error transaction from the error queue and execute it without using the `DBMS_APPLY_ADM` package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
- Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

See Also: CREATE_WRAPPED Procedures on page 29-10

Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP(
   ddl      VARCHAR2)
  RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the PARSE Procedure in the DBMS_SQL package and its argument list follows the convention of DBMS_SQL.PARSE:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2S,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the PARSE Procedure in the DBMS_SQL package:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2A,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2A;
```

Parameters

Table 29–9 WRAP Function Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
   ddl VARCHAR2(32767);
BEGIN
   ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

30

DBMS_DEBUG

DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

> **Note:** The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

Using DBMS_DEBUG

Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with DBMS_DEBUG. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using DBMS_DEBUG: This tells it which target session to supervise. The debug session may then call entry points in DBMS_DEBUG to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- SYNCHRONIZE Function
- DEBUG_ON Procedure
- DEBUG_OFF Procedure

DBMS_DEBUG does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

Constants

A breakpoint status may have the following value:

- `breakpoint_status_unused`—breakpoint is not in use

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

Variables

The DBMS_DEBUG uses the variables shown in Table 30–1.

Table 30–1 DBMS_DEBUG Variables

Variable	Description
default_timeout	The timeout value (used by both sessions).The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

Exceptions

These values are returned by the various functions called in the debug session (SYNCHRONIZE, CONTINUE, SET_BREAKPOINT, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Value	Description
success	Normal termination.

Statuses returned by GET_VALUE and SET_VALUE:

Status	Description
error_bogus_frame	No such entrypoint on the stack.
error_no_debug_info	Program was compiled without debug symbols.
error_no_such_object	No such variable or parameter.
error_unknown_type	Debug information is unreadable.
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided.
error_illegal_index	No such element exists in the collection.
error_nullcollection	Table is atomically null.
error_nullvalue	Value is null.

Statuses returned by SET_VALUE:

Status	Description
error_illegal_value	Constraint violation.
error_illegal_null	Constraint violation.
error_value_malformed	Unable to decipher the given value.
error_other	Some other error.
error_name_incomplete	Name did not resolve to a scalar.

Statuses returned by the breakpoint functions:

Status	Description
error_no_such_breakpt	No such breakpoint.
error_idle_breakpt	Cannot enable or disable an unused breakpoint.
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation).

General error codes (returned by many of the DBMS_DEBUG subprograms):

Status	Description
error_unimplemented	Functionality is not yet implemented.
error_deferred	No program running; operation deferred.
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server.
error_communication	Some error other than a timeout occurred.
error_timeout	Timout occurred.

Exception	Description
illegal_init	DEBUG_ON was called prior to INITIALIZE.

The following exceptions are raised by procedure SELF_CHECK:

Exception	Description
pipe_creation_failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 30–1 and Figure 30–2 illustrate the flow of operations in the session to be debugged and in the debugging session.

Figure 30–1 Target Session

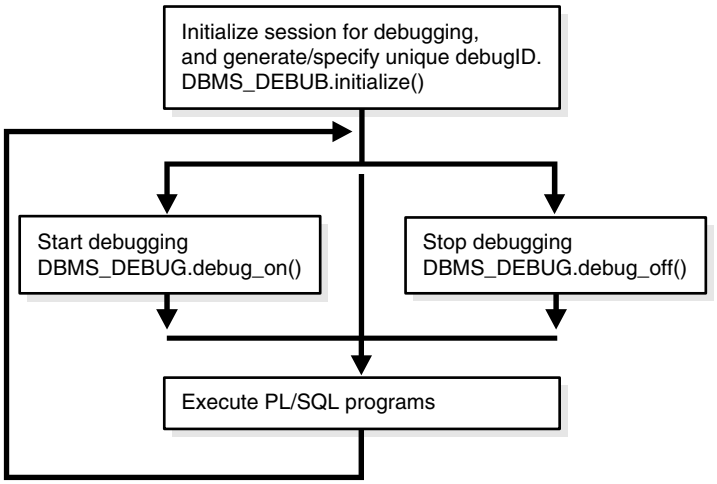

Figure 30–2 Debug Session

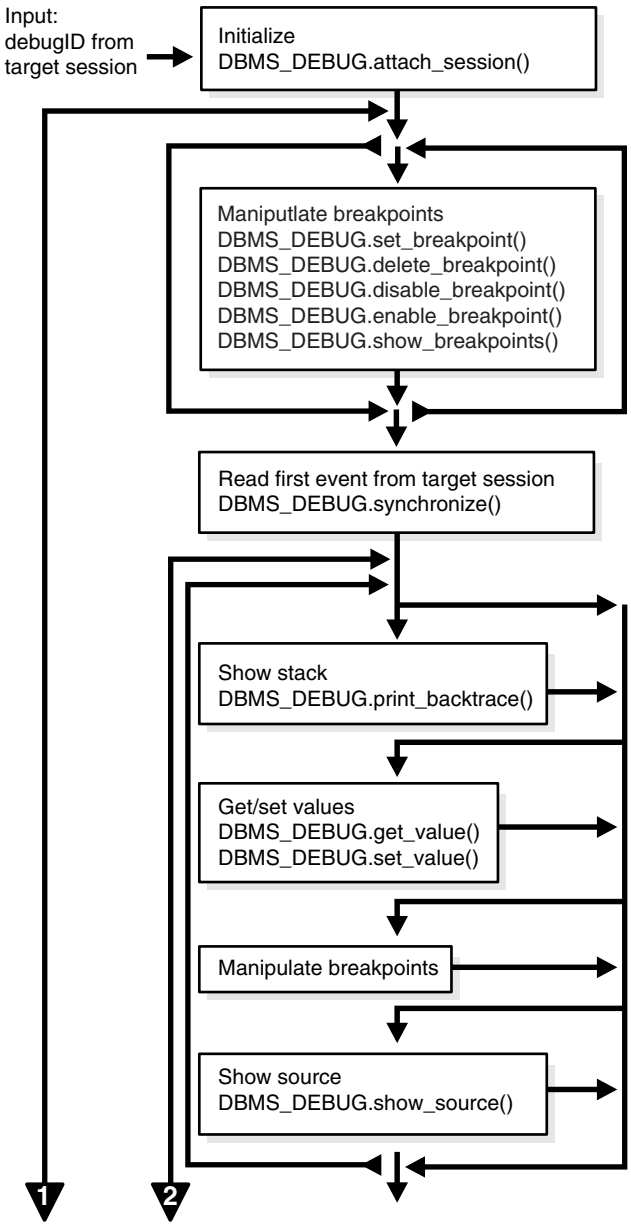

Figure 30–3 Debug Session (Cont.)

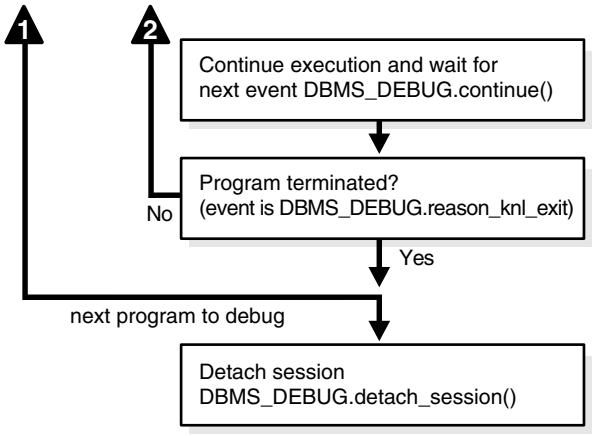

Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common and Debug Session Sections

- Common Section

- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- PROBE_VERSION Procedure
- SELF_CHECK Procedure
- SET_TIMEOUT Function

Target Session

The following subprograms may be called only in the target session:

- INITIALIZE Function
- DEBUG_ON Procedure
- SET_TIMEOUT_BEHAVIOUR Procedure
- GET_TIMEOUT_BEHAVIOUR Function

Debug Session Section

The following subprograms should be run in the debug session only:

- ATTACH_SESSION Procedure
- SYNCHRONIZE Function
- SHOW_FRAME_SOURCE Procedure
- SHOW_SOURCE Procedures
- GET_MORE_SOURCE Procedure
- PRINT_BACKTRACE Procedure
- CONTINUE Function
- SET_BREAKPOINT Function
- DELETE_BREAKPOINT Function
- SET_OER_BREAKPOINT Function
- DELETE_OER_BREAKPOINT Function
- ENABLE_BREAKPOINT Function
- DISABLE_BREAKPOINT Function
- SHOW_BREAKPOINTS Procedures
- SET_VALUE Functionn
- GET_VALUE Function
- TARGET_PROGRAM_RUNNING Procedure
- DETACH_SESSION Procedure
- GET_RUNTIME_INFO Function
- PRINT_INSTANTIATIONS Procedure
- PING Procedure
- GET_LINE_MAP Function

- GET_RUNTIME_INFO Function
- GET_INDEXES Function
- EXECUTE Procedure

OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are exception_init'd to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
   - Package specifications.
   - Procedures and functions that are not nested inside other packages, procedures, or functions.
   - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
4. `Namespace_trigger` contains triggers.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

- `LibunitType_cursor`
- `LibunitType_procedure`
- `LibunitType_function`
- `LibunitType_package`
- `LibunitType_package_body`
- `LibunitType_trigger`
- `LibunitType_Unknown`

Breakflags

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
`break_next_line`	Break at next source line (step over calls).

Value	Description
break_any_call	Break at next source line (step into calls).
break_any_return	Break after returning from current entrypoint (skip over any entrypoints called from the current routine).
break_return	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then break_return stops at the end of Proc2.)
break_exception	Break when an exception is raised.
break_handler	Break when an exception handler is executed.
abort_execution	Stop execution and force an 'exit' event as soon as DBMS_DEBUG.CONTINUE is called.

Information Flags

These are flags which may be passed as the info_requested parameter to SYNCHRONIZE, CONTINUE, and GET_RUNTIME_INFO.

Flag	Description
info_getStackDepth	Get the current depth of the stack.
info_getBreakpoint	Get the breakpoint number.
info_getLineinfo	Get program unit information.

Reasons for Suspension

After CONTINUE is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-
reason_interpreter_starting	Interpreter is starting.
reason_breakpoint	Hit a breakpoint.
reason_enter	Procedure entry.
reason_return	Procedure is about to return.
reason_finish	Procedure is finished.
reason_line	Reached a new line.
reason_interrupt	An interrupt occurred.
reason_exception	An exception was raised.
reason_exit	Interpreter is exiting (old form).
reason_knl_exit	Kernel is exiting.
reason_handler	Start exception-handler.
reason_timeout	A timeout occurred.
reason_instantiate	Instantiation block.
reason_abort	Interpreter is aborting.

Data Structures

The DBMS_DEBUG package defines RECORD types and TABLE types.

RECORD Types

- BREAKPOINT_INFO Record Type
- PROGRAM_INFO Record Type
- RUNTIME_INFO Record Type

TABLE Types

- BACKTRACE_TABLE Table Type
- BREAKPOINT_TABLE Table Type
- INDEX_TABLE Table Type
- VC2_TABLE Table Type

BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
   name        VARCHAR2(30),
   owner       VARCHAR2(30),
   dblink      VARCHAR2(30),
   line#       BINARY_INTEGER,
   libunittype BINARY_INTEGER,
   status      BINARY_INTEGER);
```

Fields

Table 30–2 RUNTIME_INFO Fields

Field	Description
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	`NULL`, unless this is a nested procedure or function
`status`	See Constants on page 30-4 for values of `breakpoint_status_*`

PROGRAM_INFO Record Type

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
    -- The following fields are used when setting a breakpoint
    namespace        BINARY_INTEGER,
    name             VARCHAR2(30),
    owner            VARCHAR2(30),
    dblink           VARCHAR2(30),
    line#            BINARY_INTEGER,
    -- Read-only fields (set by Probe when doing a stack backtrace)
    libunittype      BINARY_INTEGER,
    entrypointname   VARCHAR2(30));
```

Fields

Table 30–3 PROGRAM_INFO Fields

Field	Description
`namespace`	See Namespaces on page 30-12
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	A read-only field, `NULL`, unless this is a nested procedure or function
`entrypointname`	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See the Libunit Types on page 30-12 for more information.

RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```
TYPE runtime_info IS RECORD(
    line#            BINARY_INTEGER,
    terminated       binary_integer,
    breakpoint       binary_integer,
    stackdepth       BINARY_INTEGER,
    interpreterdepth BINARY_INTEGER,
    reason           BINARY_INTEGER,
    program          program_info);
```

Fields

Table 30–4 RUNTIME_INFO Fields

Field	Description
`line#`	Duplicate of `program.line#`
`terminated`	Whether the program has terminated
`breakpoint`	Breakpoint number
`stackdepth`	Number of frames on the stack
`interpreterdepth`	[A reserved field]
`reason`	Reason for suspension
`program`	Source location

BACKTRACE_TABLE Table Type

This type is used by `PRINT_BACKTRACE`.

Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

BREAKPOINT_TABLE Table Type

This type is used by SHOW_BREAKPOINTS.

Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

INDEX_TABLE Table Type

This type is used by `GET_INDEXES` to return the available indexes for an indexed table.

Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_DEBUG Subprograms

Table 30–5 DBMS_DEBUG Package Subprograms

Subprogram	Description
ATTACH_SESSION Procedure on page 30-24	Notifies the debug session about the target debugID
CONTINUE Function on page 30-25	Continues execution of the target program
DEBUG_OFF Procedure on page 26	Turns debug-mode off
DEBUG_ON Procedure on page 30-27	Turns debug-mode on
DELETE_BREAKPOINT Function on page 30-28	Deletes a breakpoint
DELETE_OER_ BREAKPOINT Function on page 30-29	Deletes an OER breakpoint
DETACH_SESSION Procedure on page 30-30	Stops debugging the target program
DISABLE_BREAKPOINT Function on page 30-31	Disables a breakpoint
ENABLE_BREAKPOINT Function on page 30-32	Activates an existing breakpoint
EXECUTE Procedure on page 30-33	Executes SQL or PL/SQL in the target session
GET_INDEXES Function on page 30-35	Returns the set of indexes for an indexed table
GET_MORE_SOURCE Procedure on page 30-36	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
GET_LINE_MAP Function on page 30-37	Returns information about line numbers in a program unit
GET_RUNTIME_INFO Function on page 30-38	Returns information about the current program
GET_TIMEOUT_ BEHAVIOUR Function on page 30-39	Returns the current timeout behavior
GET_VALUE Function on page 30-40	Gets a value from the currently-running program
INITIALIZE Function on page 30-42	Sets debugID in target session
PING Procedure on page 30-44	Pings the target session to prevent it from timing out
PRINT_BACKTRACE Procedure on page 30-45	Prints a stack backtrace
PRINT_INSTANTIATIONS Procedure on page 30-46	Prints a stack backtrace
PROBE_VERSION Procedure on page 30-47	Returns the version number of `DBMS_DEBUG` on the server

Table 30–5 (Cont.) DBMS_DEBUG Package Subprograms

Subprogram	Description
SELF_CHECK Procedure on page 30-48	Performs an internal consistency check
SET_BREAKPOINT Function on page 30-49	Sets a breakpoint in a program unit
SET_OER_BREAKPOINT Function on page 30-50	Sets an OER breakpoint
SET_TIMEOUT Function on page 30-51	Sets the timeout value
SET_TIMEOUT_ BEHAVIOUR Procedure on page 30-52	Tells Probe what to do with the target session when a timeout occurs
SET_VALUE Function on page 30-53	Sets a value in the currently-running program
SHOW_BREAKPOINTS Procedures on page 30-55	Returns a listing of the current breakpoints
SHOW_FRAME_SOURCE Procedure on page 30-56	Fetches the frame source
SHOW_SOURCE Procedures on page 30-57	Fetches program source
SYNCHRONIZE Function on page 30-59	Waits for program to start running
TARGET_PROGRAM_ RUNNING Procedure on page 30-60	Returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not

ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (
   debug_session_id  IN VARCHAR2,
   diagnostics       IN BINARY_INTEGER := 0);
```

Parameters

Table 30–6 ATTACH_SESSION Procedure Parameters

Parameter	Description
`debug_session_id`	Debug ID from a call to `INITIALIZE` in target session.
`diagnostics`	Generate diagnostic output if nonzero.

CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not `NULL`, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (
   run_info       IN OUT runtime_info,
   breakflags     IN     BINARY_INTEGER,
   info_requested IN     BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–7 CONTINUE Function Parameters

Parameter	Description
`run_info`	Information about the state of the program.
`breakflags`	Mask of events that are of interest. See "Breakflags" on page 30-12.
`info_requested`	Which information should be returned in `run_info` when the program stops. See "Information Flags" on page 30-13.

Return Values

Table 30–8 CONTINUE Function Return Values

Return	Description
`success`	
`error_timeout`	Timed out before the program started running.
`error_communication`	Other communication error.

DEBUG_OFF Procedure

Caution: There must be a debug session waiting if immediate is `TRUE`**.**

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (
   no_client_side_plsql_engine BOOLEAN := TRUE,
   immediate                   BOOLEAN := FALSE);
```

Parameters

Table 30–9 DEBUG_ON Procedure Parameters

Parameter	Description
`no_client_side_ plsql_engine`	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine.
`immediate`	If this is `TRUE`, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–10 DELETE_BREAKPOINT Function Parameters

Parameter	Description
`breakpoint`	Breakpoint number from a previous call to `SET_BREAKPOINT`.

Return Values

Table 30–11 DELETE_BREAKPOINT Function Return Values

Return	Description
`success`	
`error_no_such_ breakpt`	No such breakpoint exists.
`error_idle_breakpt`	Cannot delete an unused breakpoint.
`error_stale_breakpt`	The program unit was redefined since the breakpoint was set.

DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 30–12 DELETE_OER_BREAKPOINT Function Parameters

Parameter	Description
oer	The OER (positive 4-byte number) to delete.

DETACH_SESSION Procedure

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–13 DISABLE_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT.

Return Values

Table 30–14 DISABLE_BREAKPOINT Function Return Values

Returns	Description
success	
error_no_such_ breakpt	No such breakpoint exists.
error_idle_breakpt	Cannot disable an unused breakpoint.

ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–15 ENABLE_BREAKPOINT Function Parameters

Parameter	Description
`breakpoint`	Breakpoint number from a previous call to `SET_BREAKPOINT`.

Return Values

Table 30–16 ENABLE_BREAKPOINT Function Return Values

Return	Description
`success`	Success.
`error_no_such_ breakpt`	No such breakpoint exists.
`error_idle_breakpt`	Cannot enable an unused breakpoint.

EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

Syntax

```
DBMS_DEBUG.EXECUTE (
   what         IN VARCHAR2,
   frame#       IN BINARY_INTEGER,
   bind_results IN BINARY_INTEGER,
   results      IN OUT NOCOPY dbms_debug_vc2coll,
   errm         IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 30–17 EXECUTE Procedure Parameters

Parameter	Description
what	SQL or PL/SQL source to execute.
frame#	The context in which to execute the code. Only -1 (global context) is supported at this time.
bind_results	Whether the source wants to bind to results in order to return values from the target session. 0 = No 1 = Yes
results	Collection in which to place results, if bind_results is not 0.
errm	Error message, if an error occurred; otherwise, NULL.

Examples

Example 1

This example executes a SQL statement. It returns no results.

```
DECLARE
   coll sys.dbms_debug_vc2coll; -- results (unused)
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                      'values(''LJE'', 1, 1)',
                      -1, 0, coll, errm);
END;
```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
```

```
   dbms_debug.execute(
       'DECLARE PRAGMA autonomous_transaction; ' ||
       'BEGIN ' ||
       '   insert into emp(ename, empno, deptno) ' ||
       '   values(''LJE'', 1, 1); ' ||
       ' COMMIT; ' ||
       'END;',
       -1, 0, coll, errm);
END;
```

Example 3

This example executes a PL/SQL block, and it returns some results.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute(
      'DECLARE ' ||
      '   pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
      '   x  PLS_INTEGER; ' ||
      '   i  PLS_INTEGER := 1; ' ||
      'BEGIN ' ||
      '   SELECT COUNT(*) INTO x FROM emp; ' ||
      '   pp.EXTEND(x * 6); ' ||
      '   FOR c IN (SELECT * FROM emp) LOOP ' ||
      '      pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
      '      pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
      '      pp(i) := ''Job:   '' || c.job;   i := i+1; ' ||
      '      pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
      '      pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
      '      pp(i) := null;                   i := i+1; ' ||
      '   END LOOP; ' ||
      '   :1 := pp;' ||
      'END;',
       -1, 1, coll, errm);
   each := coll.FIRST;
   WHILE (each IS NOT NULL) LOOP
      dosomething(coll(each));
      each := coll.NEXT(each);
   END LOOP;
END;
```

GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```
DBMS_DEBUG.GET_INDEXES (
   varname   IN  VARCHAR2,
   frame#    IN  BINARY_INTEGER,
   handle    IN  program_info,
   entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–18 GET_INDEXES Function Parameters

Parameter	Description
varname	Name of the variable to get index information about.
frame#	Number of frame in which the variable or parameter resides; NULL for a package variable.
handle	Package description, if object is a package variable.
entries	1-based table of the indexes. If non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on.

Return Values

Table 30–19 GET_INDEXES Function Return Values

Return	Description
error_no_such_object	Either: - The package does not exist. - The package is not instantiated. - The user does not have privileges to debug the package. - The object does not exist in the package.

GET_MORE_SOURCE Procedure

When source does not fit in the buffer provided by that version of the SHOW_SOURCE Procedures which produce a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (
   buffer          IN OUT VARCHAR2,
   buflen          IN BINARY_INTEGER,
   piece#          IN BINARY_INTEGER);
```

Parameters

Table 30–20 GET_MORE_SOURCE Procedure Parameters

Parameter	Description
buffer	The buffer.
buflen	The length of the buffer.
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures.

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```
DBMS_DEBUG.GET_LINE_MAP (
   program                IN   program_info,
   maxline                OUT  BINARY_INTEGER,
   number_of_entry_points OUT  BINARY_INTEGER,
   linemap                OUT  RAW)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–21 GET_LINE_MAP Function Parameters

Parameter	Description
program	A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.
maxline	The largest source code line number in 'program'.
number_of_entry_points	The number of subprograms in 'program'
linemap	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.

Return Values

Table 30–22 GET_LINE_MAP Function Return Values

Return	Description
success	A successful completion.
error_no_debug_info	The program unit exists, but has no debug info.
error_bad_handle	No such program unit exists.

GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to `0`.

Note: This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (
   info_requested  IN  BINARY_INTEGER,
   run_info        OUT runtime_info)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–23 GET_RUNTIME_INFO Function Parameters

Parameter	Description
`info_requested`	Which information should be returned in `run_info` when the program stops. See "Information Flags" on page 30-13.
`run_info`	Information about the state of the program.

GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
 RETURN BINARY_INTEGER;
```

Parameters

Table 30–24 GET_TIMEOUT_BEHAVIOUR Function Parameters

Parameter	Description
`oer`	The OER (a 4-byte positive number).

Return Values

Table 30–25 GET_TIMEOUT_BEHAVIOUR Function Return Values

Return	Description
`success`	A successful completion.

Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   frame#         IN  BINARY_INTEGER,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–26 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter.
frame#	Frame in which it lives; 0 means the current procedure.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 30–27 GET_VALUE Function Return Values

Return	Description
success	A successful completion.
error_bogus_frame	Frame does not exist.
error_no_debug_info	Entrypoint has no debug information.
error_no_such_object	variable_name does not exist in frame#.
error_unknown_type	The type information in the debug information is illegible.
error_nullvalue	Value is NULL.
error_indexed_table	The object is a table, but no index was provided.

This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   handle         IN  program_info,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 30–28 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter.
handle	Description of the package containing the variable.
scalar_value	Value.
format	Optional date format to use, if meaningful.

Return Values

Table 30–29 GET_VALUE Function Return Values

Return	Description
error_no_such_object	Either: - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.
error_indexed_table	The object is a table, but no index was provided.

Examples

This example illustrates how to get the value with a given package PACK in schema SCOTT, containing variable VAR:

```
DECLARE
   handle     dbms_debug.program_info;
   resultbuf  VARCHAR2(500);
   retval     BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```
DBMS_DEBUG.INITIALIZE (
   debug_session_id  IN VARCHAR2       := NULL,
   diagnostics       IN BINARY_INTEGER := 0)
  RETURN VARCHAR2;
```

Parameters

Table 30–30 INITIALIZE Function Parameters

Parameter	Description
debug_session_id	Name of session ID. If NULL, then a unique ID is generated.
diagnostics	Indicates whether to dump diagnostic output to the tracefile. 0 = (default) no diagnostics 1 = print diagnostics

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use DBMS_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The CREATE ANY PROCEDURE privilege does not affect the visibility of routines through the debugger. A privilege DEBUG for each object has been introduced with a corresponding DEBUG ANY PROCEDURE variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for DEBUG CONNECT SESSION privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or PUBLIC will be used to check for DEBUG CONNECT SESSION. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the DEBUG privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made

(even if those roles were not available within a definer's rights environment of the call), and the debug role.

PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

Syntax

```
DBMS_DEBUG.PING;
```

Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour`.

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call debug_off) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.
- `abort_on_timeout` - Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;

continue_on_timeout CONSTANT BINARY_INTEGER:= 1;

nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;

abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (
  listing IN OUT VARCHAR2);

DBMS_DEBUG.PRINT_BACKTRACE (
  backtrace OUT backtrace_table);
```

Parameters

Table 30–31 PRINT_BACKTRACE Procedure Parameters

Parameter	Description
listing	A formatted character buffer with embedded newlines.
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
   pkgs   IN OUT NOCOPY backtrace_table,
   flags  IN BINARY_INTEGER);
```

Parameters

Table 30–32 PRINT_INSTANTIATIONS Procedure Parameters

Parameter	Description
`pkgs`	The instantiated packages
`flags`	Bitmask of options: ■ 1 - show specs ■ 2 - show bodies ■ 4 - show local instantiations ■ 8 - show remote instantiations (NYI) ■ 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.

Exceptions

`no_target_program` - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: `Namespace, Name, Owner,` and `LibunitType.`

In addition, Line# contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

```
DBMS_DEBUG.PROBE_VERSION (
   major out BINARY_INTEGER,
   minor out BINARY_INTEGER);
```

Parameters

Table 30–33 PROBE_VERSION Procedure Parameters

Parameter	Description
major	Major version number.
minor	Minor version number: increments as functionality is added.

SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pbload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
   timeout IN binary_integer := 60);
```

Parameters

Table 30–34 SELF_CHECK Procedure Parameters

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

Exceptions

Table 30–35 SELF_CHECK Procedure Exceptions

Exception	Description
OER-6516	Probe version is inconsistent.
pipe_creation_ failure	Could not create a pipe.
pipe_send_failure	Could not write data to the pipe.
pipe_receive_failure	Could not read data from the pipe.
pipe_datatype_ mismatch	Datatype in the pipe was wrong.
pipe_data_error	Data got garbled in the pipe.

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
   program     IN  program_info,
   line#       IN  BINARY_INTEGER,
   breakpoint# OUT BINARY_INTEGER,
   fuzzy       IN  BINARY_INTEGER := 0,
   iterations  IN  BINARY_INTEGER := 0)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–36 SET_BREAKPOINT Function Parameters

Parameter	Description
program	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)
line#	Line at which the breakpoint is to be set.
breakpoint#	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint.
fuzzy	Only applicable if there is no executable code at the specified line: 0 means return error_illegal_line. 1 means search forward for an adjacent line at which to place the breakpoint. -1 means search backward for an adjacent line at which to place the breakpoint.
iterations	Number of times to wait before signalling this breakpoint.

Return Values

Note: The fuzzy and iterations parameters are not yet implemented.

Table 30–37 SET_BREAKPOINT Function Return Values

Return	Description
success	A successful completion.
error_illegal_line	Cannot set a breakpoint at that line.
error_bad_handle	No such program unit exists.

SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 30–38 SET_OER_BREAKPOINT Function Parameters

Parameter	Description
`oer`	The OER (positive 4-byte number) to delete.

Return Values

Table 30–39 SET_OER_BREAKPOINT Function Return Values

Return	Description
`success`	A successful completion.
`error_no_such_ breakpt`	No such OER breakpoint exists.

SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT (
   timeout BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–40 SET_TIMEOUT Function Parameters

Parameter	Description
`timeout`	The timeout to use for communication between the target and debug sessions.

SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
   behaviour IN PLS_INTEGER);
```

Parameters

Table 30–41 SET_TIMEOUT_BEHAVIOUR Procedure Parameters

Parameter	Description
`behaviour - One of the following:`	
`retry_on_timeout`	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
`continue_on_timeout`	Continue execution, using same event flags.
`nodebug_on_timeout`	Turn debug-mode OFF (in other words, call `debug_off`) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
`abort_on_timeout`	Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```
DBMS_DEBUG.SET_VALUE (
   frame#               IN binary_integer,
   assignment_statement IN varchar2)
  RETURN BINARY_INTEGER;

DBMS_DEBUG.SET_VALUE (
   handle               IN program_info,
   assignment_statement IN VARCHAR2)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–42 SET_VALUE Function Parameters

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable.
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

Return Values

Table 30–43 SET_VALUE Function Return Values

Return	Description
success	-
error_illegal_value	Not possible to set it to that value.
error_illegal_null	Cannot set to NULL because object type specifies it as 'not null'.
error_value_ malformed	Value is not a scalar.
error_name_ incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	Either: - Package does not exist. - Package is not instantiated. - User does not have privileges to debug the package. - Object does not exist in the package.

Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that

modification to a package variable using SET_VALUE might not take effect for a line or two.

Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
   handle  dbms_debug.program_info;
   retval  BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.set_value(handle, 'var := 6;');
END;
```

SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   code_breakpoints  OUT breakpoint_table,
   oer_breakpoints   OUT oer_table);
```

Parameters

Table 30–44 SHOW_BREAKPOINTS Procedure Parameters

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints.
	Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
code_breakpoints	The indexed table of breakpoint entries, indexed by breakpoint number.
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER.

SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
   first_line  IN            BINARY_INTEGER,
   last_line   IN            BINARY_INTEGER,
   source      IN OUT NOCOPY vc2_table,
   frame_num   IN            BINARY_INTEGER);
```

Parameters

Table 30–45 SHOW_FRAME_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#.
frame_num	1-based frame number.

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source n order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the Usage Notes to SHOW_SOURCE Procedures.

SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded `SHOW_SOURCE` procedures.

Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
   first_line  IN   BINARY_INTEGER,
   last_line   IN   BINARY_INTEGER,
   source      OUT  vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
   first_line   IN     BINARY_INTEGER,
   last_line    IN     BINARY_INTEGER,
   window       IN     BINARY_INTEGER,
   print_arrow  IN     BINARY_INTEGER,
   buffer       IN OUT VARCHAR2,
   buflen       IN     BINARY_INTEGER,
   pieces       OUT    BINARY_INTEGER);
```

Parameters

Table 30–46 SHOW_SOURCE Procedure Parameters

Parameter	Description
`first_line`	Line number of first line to fetch. (PL/SQL programs always start at line 1 and have no holes.)
`last_line`	Line number of last line to fetch. No lines are fetched past the end of the program.
`source`	The resulting table, which may be indexed by line#.
`window`	'Window' of lines (the number of lines around the current source line).
`print_arrow`	Nonzero means to print an arrow before the current line.
`buffer`	Buffer in which to place the source listing.
`buflen`	Length of buffer.
`pieces`	Set to nonzero if not all the source could be placed into the given buffer.

Return Values

An indexed table of source-lines. The source lines are stored starting at `first_line`. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
   -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
   -- or GET_RUNTIME_INFO to fill in 'info'
   SELECT text INTO <buffer> FROM all_source
```

```
   WHERE owner = info.Program.Owner
     AND name  = info.Program.Name
     AND line  = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in bufferlength (`buflen`), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not `NULL`, then it calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
   run_info       OUT  runtime_info,
   info_requested IN   BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 30–47 SYNCHRONIZE Function Parameters

Parameter	Description
`run_info`	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
`info_requested`	Optional bit-field in which to request information other than the default (which is `info_getStackDepth` + `info_getLineInfo`). 0 means that no information is requested at all. See "Information Flags" on page 30-13.

Return Values

Table 30–48 SYNCHRONIZE Function Return Values

Return	Description
`success`	A successful completion.
`error_timeout`	Timed out before the program started execution.
`error_communication`	Other communication error.

TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING
  RETURN BOOLEAN;
```

31

DBMS_DEFER

DBMS_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

Documentation of DBMS_DEFER

For a complete description of this package within the context of Replication, see DBMS_DEFER in the *Oracle Database Advanced Replication Management API Reference.*

32

DBMS_DEFER_QUERY

DBMS_DEFER_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- Documentation of DBMS_DEFER_QUERY

Documentation of DBMS_DEFER_QUERY

For a complete description of this package within the context of Replication, see DBMS_DEFER_QUERY in the *Oracle Database Advanced Replication Management API Reference*.

33

DBMS_DEFER_SYS

DBMS_DEFER_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

Documentation of DBMS_DEFER_SYS

For a complete description of this package within the context of Replication, see `DBMS_DEFER_SYS` in the *Oracle Database Advanced Replication Management API Reference*.

34

DBMS_DESCRIBE

You can use the DBMS_DESCRIBE package to get information about a PL/SQL object. When you specify an object name, DBMS_DESCRIBE returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

Using DBMS_DESCRIBE

Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

See Also: *Oracle Call Interface Programmer's Guide*

Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

Types

The DBMS_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBE_PROCEDURE in its OUT parameters. The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
    INDEX BY BINARY_INTEGER;

TYPE NUMBER_TABLE IS TABLE OF NUMBER
    INDEX BY BINARY_INTEGER;
```

Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 34–1 DBMS_DESCRIBE Errors

Error	Description
ORA-20000	ORU 10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

```
TABLE account (account_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person  (person_id number(4), person_nm varchar2(10))

FUNCTION ACCOUNT_UPDATE (account_no   NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_date   DATE)
                         return       account.balance%type;

FUNCTION ACCOUNT_UPDATE (account_no   NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_no     NUMBER)
                         return       account.balance%type;
```

This procedure might look similar to the following output:

```
overload position  argument level  datatype length prec scale rad
-------- --------- -------- ------ -------- ------ ---- ----- ---

```

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
        pvc2    IN     VARCHAR2,
        pvc     OUT    VARCHAR,
        pstr    IN OUT STRING,
        plong   IN     LONG,
        prowid  IN     ROWID,
        pchara  IN     CHARACTER,
        pchar   IN     CHAR,
        praw    IN     RAW,
        plraw   IN     LONG RAW,
        pbinint IN     BINARY_INTEGER,
        pplsint IN     PLS_INTEGER,
        pbool   IN     BOOLEAN,
        pnat    IN     NATURAL,
        ppos    IN     POSITIVE,
        pposn   IN     POSITIVEN,
```

```
        pnatn   IN     NATURALN,
        pnum    IN     NUMBER,
        pintgr  IN     INTEGER,
        pint    IN     INT,
        psmall  IN     SMALLINT,
        pdec    IN     DECIMAL,
        preal   IN     REAL,
        pfloat  IN     FLOAT,
        pnumer  IN     NUMERIC,
        pdp     IN     DOUBLE PRECISION,
        pdate   IN     DATE,
        pmls    IN     MLSLABEL) AS

BEGIN
    NULL;
END;
```

If you describe this procedure using the following:

```
CREATE OR REPLACE PACKAGE describe_it AS

    PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

  PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
    n INTEGER;
  BEGIN
    n := isize - LENGTHB(val);
    IF n < 0 THEN
      n := 0;
    END IF;
    DBMS_OUTPUT.PUT(val);
    FOR i in 1..n LOOP
      DBMS_OUTPUT.PUT(' ');
    END LOOP;
  END prt_value;

  PROCEDURE desc_proc (name VARCHAR2) IS

      overload     DBMS_DESCRIBE.NUMBER_TABLE;
      position     DBMS_DESCRIBE.NUMBER_TABLE;
      c_level      DBMS_DESCRIBE.NUMBER_TABLE;
      arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;
      dty          DBMS_DESCRIBE.NUMBER_TABLE;
      def_val      DBMS_DESCRIBE.NUMBER_TABLE;
      p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
      length       DBMS_DESCRIBE.NUMBER_TABLE;
      precision    DBMS_DESCRIBE.NUMBER_TABLE;
      scale        DBMS_DESCRIBE.NUMBER_TABLE;
      radix        DBMS_DESCRIBE.NUMBER_TABLE;
      spare        DBMS_DESCRIBE.NUMBER_TABLE;
      idx          INTEGER := 0;

  BEGIN
      DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
              name,
              null,
              null,
```

```
                overload,
                position,
                c_level,
                arg_name,
                dty,
                def_val,
                p_mode,
                length,
                precision,
                scale,
                radix,
                spare);

        DBMS_OUTPUT.PUT_LINE('Position    Name        DTY  Mode');
        LOOP
            idx := idx + 1;
            prt_value(TO_CHAR(position(idx)), 12);
            prt_value(arg_name(idx), 12);
            prt_value(TO_CHAR(dty(idx)), 5);
            prt_value(TO_CHAR(p_mode(idx)), 5);
            DBMS_OUTPUT.NEW_LINE;
        END LOOP;
    EXCEPTION
       WHEN NO_DATA_FOUND THEN
          DBMS_OUTPUT.NEW_LINE;
          DBMS_OUTPUT.NEW_LINE;

    END desc_proc;
END describe_it;
```

Then the results list all the numeric codes for the PL/SQL datatypes:

```
Position  Name    Datatype_Code  Mode
1         PVC2      1              0
2         PVC       1              1
3         PSTR      1              2
4         PLONG     8              0
5         PROWID    11             0
6         PCHARA    96             0
7         PCHAR     96             0
8         PRAW      23             0

```

Summary of DBMS_DESCRIBE Subprograms

Table 34–2 DBMS_DESCRIBE Package Subprograms

Subprogram	Description
DESCRIBE_PROCEDURE Procedure on page 34-11	Provides a brief description of a PL/SQL stored procedure

DESCRIBE_PROCEDURE Procedure

The procedure DESCRIBE_PROCEDURE provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
   object_name                   IN  VARCHAR2,
   reserved1                     IN  VARCHAR2,
   reserved2                     IN  VARCHAR2,
   overload                      OUT NUMBER_TABLE,
   position                      OUT NUMBER_TABLE,
   level                         OUT NUMBER_TABLE,
   argument_name                 OUT VARCHAR2_TABLE,
   datatype                      OUT NUMBER_TABLE,
   default_value                 OUT NUMBER_TABLE,
   in_out                        OUT NUMBER_TABLE,
   length                        OUT NUMBER_TABLE,
   precision                     OUT NUMBER_TABLE,
   scale                         OUT NUMBER_TABLE,
   radix                         OUT NUMBER_TABLE,
   spare                         OUT NUMBER_TABLE
   include_string_constraints    OUT BOOLEAN DEFAULT FALSE);
```

Parameters

Table 34–3 DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
object_name	Name of the procedure being described. The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified OBJECT_NAME can result in one of the following exceptions: ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function. ORA-20001 - The procedure or function that you specified does not exist within the given package. ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects. ORA-20003 - The object that you specified is invalid and cannot be described. ORA-20004 - The object was specified with a syntax error.
reserved1 reserved2	Reserved for future use -- must be set to NULL or the empty string.
overload	A unique number assigned to the procedure's signature. If a procedure is overloaded, then this field holds a different value for each version of the procedure.
position	Position of the argument in the parameter list. Position 0 returns the values for the return type of a function.

Table 34–3 (Cont.) DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
level	If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the *Oracle Call Interface Programmer's Guide* for a description of the ODESSP call for an example.
argument_name	Name of the argument associated with the procedure that you are describing.
datatype	Oracle datatype of the argument being described. The datatypes and their numeric type codes are: 0 placeholder for procedures with no arguments 1 VARCHAR, VARCHAR, STRING 2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL 3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL 8 LONG 11 ROWID 12 DATE 23 RAW 24 LONG RAW 58 OPAQUE TYPE 96 CHAR (ANSI FIXED CHAR), CHARACTER 106 MLSLABEL 121 OBJECT 122 NESTED TABLE 123 VARRAY 178 TIME 179 TIME WITH TIME ZONE 180 TIMESTAMP 181 TIMESTAMP WITH TIME ZONE 231 TIMESTAMP WITH LOCAL TIME ZONE 250 PL/SQL RECORD 251 PL/SQL TABLE 252 PL/SQL BOOLEAN
default_value	1 if the argument being described has a default value; otherwise, the value is 0.
in_out	Describes the mode of the parameter: 0 IN 1 OUT 2 IN OUT
length	For %rowtype formal arguments, the length constraint is returned, otherwise 0 is returned.If the include_string_constraints parameter is set to TRUE, the argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
precision	If the argument being described is of datatype 2 (NUMBER), then this parameter is the precision of that number.
scale	If the argument being described is of datatype 2 (NUMBER), then this parameter is the scale of that number.
radix	If the argument being described is of datatype 2 (NUMBER), then this parameter is the radix of that number.
spare	Reserved for future functionality.
include_ string_ constraints	The default is FALSE. If the parameter is set to TRUE, the arguments' formal type constraints is passed back if it is of the appropriate type.Those are the string types: 1;8;23;24;96

Return Values

All values from DESCRIBE_PROCEDURE are returned in its OUT parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

35

DBMS_DIMENSION

DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

> **See Also:** *Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

Using DBMS_DIMENSION

This section contains topics which relate to using the `DBMS_DIMENSION` package.

Security Model

Security on this package can be controlled by granting `EXECUTE` to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: `CREATE ANY DIMENSION`, `ALTER ANY DIMENSION`, and `DROP ANY DIMENSION`.

Summary of DBMS_DIMENSION Subprograms

Table 35–1 DBMS_DIMENSION Package Subprograms

Subprogram	Description
DESCRIBE_DIMENSION Procedure on page 35-5	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
VALIDATE_DIMENSION Procedure on page 35-6	Verifies that the relationships specified in a dimension are correct

DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (
   dimension  IN VARCHAR2);
```

Parameters

Table 35–2 DESCRIBE_DIMENSION Procedure Parameter

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table DIMENSION_EXCEPTIONS in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
   dimension               IN VARCHAR2,
   incremental             IN BOOLEAN := TRUE,
   check_nulls             IN BOOLEAN := FALSE,
   statement_id            IN VARCHAR2 := NULL );
```

Parameters

Table 35–3 VALIDATE_DIMENSION Procedure Parameters

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.
incremental	If TRUE, check only the new rows for tables of this dimension. If FALSE, check all the rows.
check_nulls	If TRUE, then all level columns are verified to be non-null. If FALSE, this check is omitted. Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

36

DBMS_DISTRIBUTED_TRUST_ADMIN

DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

Using DBMS_DISTRIBUTED_TRUST_ADMIN

Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

Security Model

To execute DBMS_DISTRIBUTED_TRUST_ADMIN, the EXECUTE_CATALOG_ROLE role must be granted to the DBA. To select from the view TRUSTED_SERVERS, the SELECT_CATALOG_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the DENY_SERVER procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures DENY_ALL and ALLOW_ALL delete all entries (in other words, server names) that are explicitly allowed or denied using the ALLOW_SERVER procedure or DENY_SERVER procedure respectively.

Examples

If you have not yet used the package DBMS_DISTRIBUTED_TRUST_ADMIN to change the trust listing, by default you trust all databases in the same enterprise domain if that domain it listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST     NAME
--------- --------------------
Trusted   All
```

Because all servers are currently trusted, you can execute the DENY_SERVER Procedure and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
                           ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Untrusted SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the DENY_ALL Procedure, you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;

PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;

TRUST      NAME
--------- ----------------------------------------------
Untrusted All
```

The ALLOW_SERVER Procedure can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
                             ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Trusted   SALES.US.AMERICAS.ACME_AUTO.COM
```

Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Table 36–1 DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms

Subprogram	Description
ALLOW_ALL Procedure on page 36-7	Empties the list and inserts a row indicating that all servers should be trusted
ALLOW_SERVER Procedure on page 36-8	Enables a specific server to be allowed access even though `deny` all is indicated in the list
DENY_ALL Procedure on page 36-9	Empties the list and inserts a row indicating that all servers should be untrusted
on page 36-10DENY_ SERVER Procedure	Enables a specific server to be denied access even though allow all is indicated in the list

ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

ALLOW_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "`deny all`").

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 36–2 ALLOW_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be trusted.

Usage Notes

If the Trusted Servers List contains the entry "`deny all`", then this procedure adds a specification indicating that a specific database (for example, `DBx`) is to be trusted.

If the Trusted Servers List contains the entry "`allow all`", and if there is no "`deny DBx`" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "`allow all`", and if there is a "`deny DBx`" entry in the list, then that entry is deleted.

DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view TRUSTED_SERVERS will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified `allow all`).

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 36–3 DENY_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be untrusted.

Usage Notes

If the Trusted Servers List contains the entry `allow all`, then this procedure adds an entry indicating that the specified database (for example, `DBx`) is not to be trusted.

If the Trusted Servers List contains the entry "`deny all`", and if there is no "`allow DBx`" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "`deny all`", and if there is an "`allow DBx`" entry, then this procedure causes that entry to be deleted.

37

DBMS_EPG

The DBMS_EPG package implements the embedded PL/SQL gateway that enables a web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

Using DBMS_EPG

Overview

The DBMS_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of mod_plsql in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser via HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

Security Model

The XDBADMIN role is required to invoke the configuration interface. It may invoked by the database user "XDB".

The authorization interface can be invoked by any user.

Exceptions

The following table lists the exceptions raised by the DBMS_EPG package.

Table 37–1 DBMS_EPG Exceptions

Exception	Error Code	Description
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

Subprogram Groups

The DBMS_EPG consists of two interfaces:

- Configuration Subprograms
- Authorization Subprograms

Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 37–2 Configuration Subprogram Group

Subprogram	Description
CREATE_DAD Procedure on page 37-12	Creates a new DAD
DELETE_DAD_ATTRIBUTE Procedure on page 37-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 37-15	Deletes a global attribute
DROP_DAD Procedure on page 37-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 37-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 37-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 37-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 37-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 37-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 37-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 37-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 37-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 37-27	Sets the value of a global attribute
UNMAP_DAD Procedure on page 37-28	Unmaps a DAD from the specified virtual path

Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 37–3 Authorization Subprogram Group

Subprogram	Description
AUTHORIZE_DAD Procedure on page 37-11	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
DEAUTHORIZE_DAD Procedure on page 37-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

Summary of DBMS_EPG Subprograms

Table 37–4 DBMS_ALERT Package Subprograms

Subprogram	Description
AUTHORIZE_DAD Procedure on page 37-11	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
CREATE_DAD Procedure on page 37-12	Creates a new DAD
DEAUTHORIZE_DAD Procedure on page 37-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
DELETE_DAD_ATTRIBUTE Procedure on page 37-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 37-15	Deletes a global attribute
DROP_DAD Procedure on page 37-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 37-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 37-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 37-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 37-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 37-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 37-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 37-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 37-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 37-27	Sets the value of a global attribute
UNMAP_DAD Procedure on page 37-28	Unmaps a DAD from the specified virtual path

AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

> **See Also:** Authorization Subprograms on page 37-9 for other subprograms in this group

Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37–5 AUTHORIZE_DAD Procedure Parameters

Parameter	Description
`dad_name`	The name of the DAD to create
`user`	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the `ALTER USER` system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

CREATE_DAD Procedure

This procedure creates a new DAD.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.CREATE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37–6 CREATE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

> **See Also:** Authorization Subprograms on page 37-9 for other subprograms in this group

Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37–7 DEAUTHORIZE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to deauthorize use
user	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (
   dad_name      IN  VARCHAR2,
   attr_name     IN  VARCHAR2);
```

Parameters

Table 37–8 DELETE_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

Exceptions

Raises an error if DAD does not exist

DELETE_GLOBAL_ATTRIBUTE Procedure

This procedure deletes a global attribute.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (
   attr_name     IN  VARCHAR2);
```

Parameters

Table 37–9 DELETE_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to delete

DROP_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DROP_DAD (
   dadname  IN  VARCHAR2);
```

Parameters

Table 37–10 DROP_DAD Procedure Parameters

Parameter	Description
dad_name	The DAD to drop

Exceptions

Raises an error if the DAD does not exist.

GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
   dad_name      IN          VARCHAR2,
   attr_names    OUT NOCOPY  VARCHAR2_TABLE,
   attr_values   OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 37–11 GET_ALL_DAD_ATTRIBUTES Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then attr_names and attr_values will be set to empty arrays.

GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all virtual paths to which the specified DAD is mapped.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (
   dad_name      IN          VARCHAR2,
   paths         OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 37–12 GET_ALL_DAD_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which h the DAD is mapped

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD is not mapped to any virtual path, paths will be set to empty arrays.

GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
   attr_names     OUT   NOCOPY  VARCHAR2_TABLE,
   attr_values    OUT   NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 37–13 GET_ALL_GLOBAL_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

Usage Notes

If the gateway instance has no global attributes set, then attr_names and attr_values will be set to empty arrays.

GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (
   dad_name     IN  VARCHAR2,
   attr_name    IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 37–14 GET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_names	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_LIST (
   dad_names     OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 37–15 GET_DAD_LIST Procedure Parameters

Parameter	Description
dad_names	The list of all DADs

Usage Notes

If no DADs exist then dad_names will be set to an empty array.

GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (
   attr_name  IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 37–16 GET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to retrieve

Return Values

Returns the global attribute value. Returns NULL if attribute has not been set or is not a valid attribute.

MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.MAP_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2);
```

Parameters

Table 37–17 MAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

Exceptions

Raises and error if the DAD does not exist.

SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

See Also: Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
   dad_name    IN  VARCHAR2,
   attr_name   IN  VARCHAR2,
   attr_value  IN  VARCHAR2);
```

Parameters

Table 37–18 SET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

Table 37–19 Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String

Table 37–19 (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInputFilterEnable	input-filter-enable	No	Enumeration of On, Off
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetPackageState, StatelessWithFastRestPackageState, StatelessWithPreservePackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Char, Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. mod_plsql users should note the following
  - The `PlsqlDatabasePassword` attribute is not needed.
  - The `PlsqlDatabaseConnectString` attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
   attr_name    IN VARCHAR2,
   attr_value   IN VARCHAR2);
```

Parameters

Table 37–20 SET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

Table 37–21 Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If attr_name attribute has been set before, then the old value will be overwritten with the new attr_value argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

> **See Also:** Configuration Subprograms on page 37-8 for other subprograms in this group

Syntax

```
DBMS_EPG.UNMAP_DAD (
   dad_name IN VARCHAR2,
   path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 37–22 UNMAP_DAD Procedure Parameters

Parameter	Description
`dad_name`	The name of the DAD to unmap
`path`	The virtual path to unmap

Usage Notes

Raises and error if the DAD does not exist.

38

DBMS_ERRLOG

The DBMS_ERRLOG package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information regarding how to use DBMS_ERRLOG and *Oracle Database SQL Reference* for error_logging_clause syntax

This chapter contains the following topics:

Using DBMS_ERRLOG

This section contains topics which relate to using the `DBMS_ERRLOG` package.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

Summary of DBMS_ERRLOG Subprograms

Table 38–1 DBMS_ERRLOG Package Subprograms

Subprogram	Description
CREATE_ERROR_LOG Procedure on page 38-5	Creates the error logging table used in DML error logging

CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

LONG, CLOB, BLOB, BFILE, and ADT datatypes are not supported in the columns.

Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
   dml_table_name            IN VARCHAR2,
   err_log_table_name        IN VARCHAR2 := NULL,
   err_log_table_owner       IN VARCHAR2 := NULL,
   err_log_table_space       IN VARCHAR2 := NULL,
   skip_unsupported          IN BOOLEAN := FALSE);
```

Parameters

Table 38–2 CREATE_ERROR_LOG Procedure Parameters

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR$_'. Examples are the following: dml_table_name: 'EMP',err_log_table_name: 'ERR$_EMP' dml_table_name: '"Emp2"',err_log_table_name: 'ERR$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                                      Null?    Type
----------------------------              -------  -----
CHANNEL_ID                                NOT NULL CHAR(1)
```

```
CHANNEL_DESC                            NOT NULL    VARCHAR2(20)
CHANNEL_CLASS                                       VARCHAR2(20)
```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                            Null?    Type
------------------              ----     ----
ORA_ERR_NUMBER$                          NUMBER
ORA_ERR_MESG$                            VARCHAR2(2000)
ORA_ERR_ROWID$                           ROWID
ORA_ERR_OPTYP$                           VARCHAR2(2)
ORA_ERR_TAG$                             VARCHAR2(2000)
CHANNEL_ID                               VARCHAR2(4000)
CHANNEL_DESC                             VARCHAR2(4000)
CHANNEL_CLASS                            VARCHAR2(4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

39

DBMS_EXPFIL

The DBMS_EXPFIL package contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.

> **See Also:** *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.

This chapter contains the following topics:

- Summary of Expression Filter Subprograms

Summary of Expression Filter Subprograms

Table 39–1 describes the subprograms in the DBMS_EXPFIL package.

All the values and names passed to the procedures defined in the DBMS_EXPFIL package are not case sensitive, unless otherwise mentioned. To preserve the case, you use double quotation marks around the values.

Table 39–1 DBMS_EXPFIL Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the attribute set
ADD_FUNCTIONS Procedure	Adds a function, type, or package to the approved list of functions with an attribute set
ASSIGN_ATTRIBUTE_SET Procedure	Assigns an attribute set to a column storing expressions
BUILD_EXCEPTIONS_TABLE Procedure	Creates an exception table to hold references to invalid expressions
CLEAR_EXPRSET_STATS Procedure	Clears the predicate statistics for an expression set
COPY_ATTRIBUTE_SET Procedure	Makes a copy of the attribute set
CREATE_ATTRIBUTE_SET Procedure	Creates an attribute set
DEFAULT_INDEX_PARAMETERS Procedure	Assigns default index parameters to an attribute set
DEFAULT_XPINDEX_PARAMETERS Procedure	Assigns default XPath index parameters to an attribute set
DEFRAG_INDEX Procedure	Rebuilds the bitmap indexes online to reduce fragmentation
DROP_ATTRIBUTE_SET Procedure	Drops an unused attribute set
GET_EXPRSET_STATS Procedure	Collects predicate statistics for an expression set
GRANT_PRIVILEGE Procedure	Grants an expression DML privilege to a user
INDEX_PARAMETERS Procedure	Assigns index parameters to an expression set
MODIFY_OPERATOR_LIST Procedure	Modifies the list of common operators used in predicates with a certain attribute
REVOKE_PRIVILEGE Procedure	Revokes an expression DML privilege from a user
UNASSIGN_ATTRIBUTE_SET Procedure	Breaks the association between a column storing expressions and the attribute set
VALIDATE_EXPRESSIONS Procedure	Validates expression metadata and the expressions stored in a column
XPINDEX_PARAMETERS Procedure	Assigns XPath index parameters to an expression set

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to the attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   attr_type  IN   VARCHAR2,
   attr_defv1 IN   VARCHAR2 DEFAULT NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   tab_alias  IN   exf$table_alias);
```

Parameters

Table 39–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defv1	Default value for the elementary attribute
tab_alias	The type that identifies the database table to which the attribute is aliased

Usage Notes

- This procedure adds an elementary attribute to an attribute set. If the attribute set was originally created from an existing object type, then additional attributes cannot be added.
- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter*.
- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- The default value specification for an attribute is similar to a default value specification for a table column. The resulting default values should agree with the

datatype of the attribute. For example, valid default values for an attribute of `DATE` datatype are `SYSDATE` and `to_date('01-01-2004','DD-MM-YYYY')`.

- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding elementary attributes.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ATTRIBUTES`.

Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                              attr_set   => 'HRAttrSet',
                              attr_name  => 'HRREP',
                              attr_type  => 'VARCHAR2(30)'
                              attr_defv1 => 'Betty Smith');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                              attr_set  => 'HRAttrSet',
                              attr_name => 'DEPT',
                              tab_alias => exf$table_alias('DEPT'));
END;
```

The following commands define a CreationTime elementary attribute that takes the database time as the default value.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                         attr_set   => 'PurchaseOrder',
                         attr_name  => 'CreationTime',
                         attr_type  => 'DATE',
                         attr_defvl => 'SYSDATE');
END;
```

Alternately, the following commands initialize the CreationTime attribute to a specific value when it is not explicitly specified in the data item passed to the EVALUATE operator.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                         attr_set   => 'PurchaseOrder',
                         attr_name  => 'CreationTime',
                         attr_type  => 'DATE',
                         attr_defvl => 'to_date(''01-01-2004'',''DD-MM-YYYY'')');
END;
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the attribute set.

Syntax

```
DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   IN   VARCHAR2,
   funcs_name IN   VARCHAR2);
```

Parameters

Table 39–3 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use by the expression set. If the expression set refers to a user-defined function, the function must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list. The function added to the attribute set, and thus used in the stored expressions, should not perform any DML or DDL (database state changing) operations. Any violations to this rule will only be caught at run-time while evaluating the expressions (this implies that this will not be checked during the ADD_FUNCTIONS procedure call).
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the expression set are considered valid. The expressions in a set can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets"in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following commands add two functions to the attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   => 'Car4Sale',
   funcs_name => 'HorsePower');
  DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   => 'Car4Sale',
```

```
   funcs_name => 'Scott.CrashTestRating');
END;
```

ASSIGN_ATTRIBUTE_SET Procedure

This procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column.

Syntax

```
DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2,
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   force      IN   VARCHAR2 DEFAULT 'FALSE');
```

Parameters

Table 39–4 ASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
force	Argument used to trust the existing expressions in a table (and skip validation)

Usage Notes

- The ASSIGN_ATTRIBUTE_SET procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column. The attribute set contains the elementary attribute names and their datatypes and any functions used in the expressions. The attribute set is used by the Expression column to validate changes and additions to the expression set.
- An attribute set can be assigned only to a table column in the same schema as the attribute set. An attribute set can be assigned to one or more table columns. Assigning an attribute set to a column storing expressions implicitly creates methods for the associated object type. For this operation to succeed, the object type cannot have any dependent objects before the attribute set is assigned.
- By default, the column should not have any expressions at the time of association. However, if the values in the column are known to be valid expressions, you can use a value of 'TRUE' for the force argument to assign the attribute set to a column containing expressions.
- See "Defining Expression Columns" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following command assigns the attribute set to a column storing expressions. The expression set should be empty at the time of association.

```
BEGIN
  DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (attr_set => 'Car4Sale',
```

```
                                        expr_tab => 'Consumer',
                                        expr_col => 'Interest');
END;
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates the exception table, used in validation, in the current schema.

Syntax

```
DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (
   exception_tab IN VARCHAR2);
```

Parameters

Table 39–5 BUILD_EXCEPTIONS_TABLE Procedure Parameter

Parameter	Description
exception_tab	The name of the exception table

Usage Notes

- The expressions stored in a table column can be validated using the VALIDATE_EXPRESSIONS procedure. During expression validation, you can optionally provide the name of the exception table in which the references to the invalid expressions are stored. The BUILD_EXCEPTIONS_TABLE procedure creates the exception table in the current schema.
- See "Evaluation Semantics" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and VALIDATE_EXPRESSIONS Procedure in this chapter for more information.
- Related view: USER_TABLES

Examples

The following command creates the exception table, InterestExceptions, in the current schema:

```
BEGIN
  DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (
                              exception_tab => 'InterestExceptions');
END;
```

CLEAR_EXPRSET_STATS Procedure

This procedure clears the predicate statistics for the expression set stored in a table column.

Syntax

```
DBMS_EXPFIL.CLEAR_EXPRSET_STATS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 39–6 CLEAR_EXPRSET_STATS Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions

Usage Notes

- This procedure clears the predicate statistics for the expression set stored in a table column. See also GET_EXPRSET_STATS Procedure in this chapter for information about gathering the statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS

Examples

The following command clears the predicate statistics for the expression set stored in Interest column of the Consumer table:

```
BEGIN
  DBMS_EXPFIL.CLEAR_EXPRSET_STATS (expr_tab => 'Consumer',
                                   expr_col => 'Interest');
END;
```

COPY_ATTRIBUTE_SET Procedure

This procedure copies an attribute set along with its user-defined function list and default index parameters to another set.

Syntax

```
DBMS_EXPFIL.COPY_ATTRIBUTE_SET (
   from_set   IN   VARCHAR2,
   to_set     IN   VARCHAR2);
```

Parameters

Table 39–7 COPY_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
from_set	Name of an existing attribute set to be copied
to_set	Name of the new attribute set

Usage Notes

- A schema-extended name can be used for the from_set argument to copy an attribute set across schemas. The user issuing the command must have EXECUTE privileges for the object type associated with the original attribute set. The user must ensure that any references to schema objects (user-defined functions, tables, and embedded objects) are valid in the new schema.
- The default index parameters and the user-defined function list of the new set can be changed independent of the original set.
- Related views: ALL_EXPFIL_ATTRIBUTE_SETS and ALL_EXPFIL_ATTRIBUTES.

Examples

The following command makes a copy of the Car4Sale attribute set:

```
BEGIN
  DBMS_EXPFIL.COPY_ATTRIBUTE_SET (from_set => 'Car4Sale',
                                  to_set   => 'Vehicle');
END;
```

CREATE_ATTRIBUTE_SET Procedure

This procedure creates an empty attribute set or an attribute set with a complete set of elementary attributes derived from an object type with a matching name.

Syntax

```
DBMS_EXPFIL.CREATE_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2,
   from_type  IN   VARCHAR2 DEFAULT 'NO');
```

Parameters

Table 39–8 CREATE_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set to be created
from_type	YES, if the attributes for the attribute set should be derived from an existing object type

Usage Notes

- The object type used for an attribute set cannot contain any user methods, and it should not be an evolved type (with the use of ALTER TYPE command). This object type should not have any dependent objects at the time of the attribute set creation. If the attribute set is not derived from an existing object type, this procedure creates an object type with a matching name.
- An attribute set with one or more table alias attributes cannot be derived from an object type. For this purpose, create an empty attribute set and add one elementary attribute at a time using the DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE procedure. (See Appendix A in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.)
- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and ADD_ELEMENTARY_ATTRIBUTE Procedures in this chapter for more information.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.

Examples

The following commands create an attribute set with all the required elementary attributes derived from the Car4Sale type:

```
CREATE OR REPLACE TYPE Car4Sale AS OBJECT
                                  (Model   VARCHAR2(20),
                                   Year    NUMBER,
                                   Price   NUMBER,
                                   Mileage NUMBER);

BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set  => 'Car4Sale',
                                  from_type => 'YES');
END;
```

Assuming that the `Car4Sale` type does not exist, the attribute set can be created from scratch as shown in the following example:

```
BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Model',
                               attr_type => 'VARCHAR2(20)');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Year',
                               attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Price',
                               attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Mileage',
                               attr_type => 'NUMBER');
END;
```

DEFAULT_INDEX_PARAMETERS Procedure

This procedure assigns default index parameters to an attribute set. It also adds or drops a partial list of stored and indexed attributes to or from the default list associated with the attribute list.

Syntax

```
DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
   attr_set   IN   VARCHAR2,
   attr_list  IN   EXF$ATTRIBUTE_LIST,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–9 DEFAULT_INDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set
attr_list	An instance of EXF$ATTRIBUTE_LIST with a partial list of (default) stored and indexed attributes for an Expression Filter index
operation	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- Existing Expression Filter indexes are not modified when the default parameters for the corresponding attribute set are changed. The new index defaults are used when a new Expression Filter index is created and when an existing index is rebuilt. (See "Alter Index Rebuild" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about rebuilding indexes.)
- See "Creating an Index from Default Parameters" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about assigning default index parameters to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command adds the specified stored and indexed attributes to the attribute set's default index parameters list:

```
BEGIN
 DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERs(
    attr_set  => 'Car4Sale',
    attr_list => exf$attribute_list (
       exf$attribute (attr_name => 'Model',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'Price',
                      attr_oper => exf$indexoper('all'),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'HorsePower(Model, Year)',
                      attr_oper => exf$indexoper('=','<','>','>=','<='),
                      attr_indexed => 'FALSE'),
       exf$attribute (attr_name => 'CrashTestRating(Model, Year)',
```

```
                    attr_oper => exf$indexoper('=','<','>','>=','<='),
                    attr_indexed => 'FALSE')),
    operation => 'ADD');
END;
```

The following command drops the `CrashTestRating(Model, Year)` attribute (stored or indexed) from the previous list.

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS(
      attr_set  => 'Car4Sale',
      attr_list => exf$attribute_list (
         exf$attribute (attr_name => 'CrashTestRating(Model, Year)')),
      operation => 'DROP');
END;
```

DEFAULT_XPINDEX_PARAMETERS Procedure

This procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set.

Syntax

```
DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS (
   attr_set   IN   VARCHAR2,
   xmlt_attr  IN   VARCHAR2,
   xptag_list IN   EXF$XPATH_TAGS,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–10 DEFAULT_XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set
xmlt_attr	The name of the attribute with the XMLType datatype
xptag_list	An instance of EXF$XPATH_TAGS type with a partial list of XML elements and attributes to be configured for the Expression Filter index
operation	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- The attribute set used for an expression set may have one or more XML type attributes (defined with XMLType datatype) and the corresponding expressions may contain XPath predicates on these attributes. The Expression Filter index created for the expression set can be tuned to process these XPath predicates efficiently by using some XPath-specific index parameters (in addition to some non-XPath index parameters).
- The DEFAULT_XPINDEX_PARAMETERS procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set. The XPath parameters are assigned to a specific XMLType attribute in the attribute set and this information can be viewed using the USER_EXPFIL_DEF_INDEX_PARAMS view. The DEFAULT_INDEX_PARAMETERS procedure and the DEFAULT_XPINDEX_PARAMETERS procedure can be used independent of each other. They maintain a common list of default index parameters for the attribute set.
- See "Index Tuning for XPath Predicates"in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about XPath parameters to the default index parameters of an attribute set. See also DEFAULT_INDEX_PARAMETERS Procedure in this chapter for more information about default index parameters.
- Related views: USER_EXPFIL_ATTRIBUTES and USER_EXPFIL_DEF_INDEX_PARAMS.

> **Note:** The values assigned to the tag_name argument of exf$xpath_tag type are case sensitive.

Examples

The following command adds the specified XML tags to the default index parameters list along with their preferences such as positional or value filter and indexed or stored predicate group:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
       attr_set   => 'Car4Sale',
       xmlt_attr  => 'Details',
       xptag_list =>                                    --- XPath tag list
         exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(15)'), --- value filter
           exf$xpath_tag(tag_name    => 'stereo',       --- XML element
                         tag_indexed => 'FALSE',
                         tag_type    => null),          --- positional filter
           exf$xpath_tag(tag_name    => 'memory',       --- XML element
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(10)'), --- value filter
           exf$xpath_tag(tag_name    => 'GPS',
                         tag_indexed => 'TRUE',
                         tag_type    => null)
         )
        );
END;
```

The following command drops the `stereo@make` tag from the default index parameters:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
       attr_set   => 'Car4Sale',
       xmlt_attr  => 'Details',
       xptag_list =>                                    --- XPath tag list
         exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make')
         ),
       operation => 'DROP'
       );
END;
```

DEFRAG_INDEX Procedure

This procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.

Syntax

```
DBMS_EXPFIL.DEFRAG_INDEX (
   idx_name   IN  VARCHAR2);
```

Parameters

Table 39–11 DEFRAG_INDEX Procedure Parameter

Parameter	Description
idx_name	The name of the Expression Filter index

Usage Notes

- The bitmap indexes defined for the indexed attributes of an Expression Filter index become fragmented as additions and updates are made to the expression set. The DEFRAG_INDEX procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.
- Indexes can be defragmented when the expression set is being modified. However, you should schedule defragmentation when the workload is relatively light.
- See "Index Storage and Maintenance" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about rebuilding indexes.
- Related views: USER_EXPFIL_INDEXES and USER_INDEXES.

Examples

The following command is issued to defragment the bitmap indexes associated with the Expression Filter index:

```
BEGIN
  DBMS_EXPFIL.DEFRAG_INDEX (idx_name => 'InterestIndex');
END;
```

DROP_ATTRIBUTE_SET Procedure

This procedure drops an attribute set not being used for any expression set.

Syntax

```
DBMS_EXPFIL.DROP_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2);
```

Parameters

Table 39–12 DROP_ATTRIBUTE_SET Procedure Parameter

Parameter	Description
attr_set	The name of the attribute set to be dropped

Usage Notes

- The DROP_ATTRIBUTE_SET procedure drops an attribute set not being used for any expression set. If the attribute set was initially created from an existing object type, the object type remains after dropping the attribute set. Otherwise, the object type is dropped with the attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS.

Examples

Assuming that the attribute set is not used by an Expression column, the following command drops the attribute set:

```
BEGIN
  DBMS_EXPFIL.DROP_ATTRIBUTE_SET(attr_set => 'Car4Sale');
END;
```

GET_EXPRSET_STATS Procedure

This procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.

Syntax

```
DBMS_EXPFIL.GET_EXPRSET_STATS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 39–13 GET_EXPRSET_STATS Procedure Parameters

Parameter	Description
`expr_tab`	The table storing the expression set
`expr_col`	The column in the table that stores the expressions

Usage Notes

- When a representative set of expressions are stored in a table column, you can use predicate statistics for those expressions to configure the corresponding Expression Filter index (using the `TOP` parameters clause). The `GET_EXPRSET_STATS` procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.
- See "Creating an Index from Statistics"in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about using predicate statistics.
- Related views: `USER_EXPFIL_EXPRESSION_SETS` and `USER_EXPFIL_EXPRSET_STATS`.

Examples

The following command computes the predicate statistics for the expressions stored in the `Interest` column of the `Consumer` table:

```
BEGIN
  DBMS_EXPFIL.GET_EXPRSET_STATS (expr_tab => 'Consumer',
                                 expr_col => 'Interest');
END;
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on one or more Expression columns to other users.

Syntax

```
DBMS_EXPFIL.GRANT_PRIVILEGE (
   expr_tab   IN  VARCHAR2,
   expr_col   IN  VARCHAR2,
   priv_type  IN  VARCHAR2,
   to_user    IN  VARCHAR2);
```

Parameters

Table 39–14 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
priv_type	Type of the privilege to be granted. Valid values: INSERT EXPRESSION, UPDATE EXPRESSION, ALL.
to_user	The user to whom the privilege is to be granted

Usage Notes

- The SQL EVALUATE operator evaluates expressions with the privileges of the owner of the table that stores the expressions. The privileges of the user issuing the query are not considered. The owner of the table can insert, update, and delete expressions. Other users must have INSERT and UPDATE privileges for the table and INSERT EXPRESSION and UPDATE EXPRESSION privilege for a specific Expression column in the table.
- Using the GRANT_PRIVILEGE procedure, the owner of the table can grant INSERT EXPRESSION or UPDATE EXPRESSION privileges on one or more Expression columns to other users. Both the privileges can be granted to a user by specifying ALL for the privilege type.
- See REVOKE_PRIVILEGE Procedure in this chapter and "Granting and Revoking Privileges" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The owner of Consumer table can grant INSERT EXPRESSION privileges to user SCOTT with the following command. User SCOTT should also have INSERT privileges on the table so that he can add new expressions to the set.

```
BEGIN
  DBMS_EXPFIL.GRANT_PRIVILEGE (expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               priv_type => 'INSERT EXPRESSION',
                               to_user   => 'SCOTT');
END;
```

INDEX_PARAMETERS Procedure

This procedure fine-tunes the index parameters for each expression set before index creation.

Syntax

```
DBMS_EXPFIL.INDEX_PARAMETERS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   attr_list  IN   EXF$ATTRIBUTE_LIST,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–15 INDEX_PARAMETERS Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions.
attr_list	An instance of EXF$ATTRIBUTE_LIST with a partial list of stored and indexed attributes
operation	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- An attribute set can be used by multiple expression sets stored in different columns of user tables. By default, the index parameters associated with the attribute set are used to define an Expression Filter index on an expression set. If you need to fine-tune the index for each expression set, you can specify a small list of the index parameters in the PARAMETERS clause of the CREATE INDEX statement. However, when an Expression Filter index uses a large number of index parameters or if the index is configured for XPath predicates, fine-tuning the parameters with the CREATE INDEX statement is not possible.
- The INDEX_PARAMETERS procedure fine-tunes the index parameters for each expression set before index creation. This procedure can be used to copy the defaults from the corresponding attribute set and selectively add (or drop) additional index parameters for the expression set. (You use the XPINDEX_PARAMETERS procedure to add and drop XPath index parameters.) The Expression Filter index defined for an expression set with a non-empty list of index parameters always uses these parameters. The INDEX_PARAMETERS procedure cannot be used when the Expression Filter index is already defined for the column storing expressions.
- The operations allowed with this procedure include:
  - Deriving the current list of default index parameters (including any XPath-specific parameters) from the corresponding attribute set and assigning them to the specified expression set (a value of DEFAULT for the operation argument).
  - Adding (or dropping) one or more attributes to (or from) the current list of parameters assigned to the expression set (values of ADD or DROP for the operation argument).

– Clearing the index parameters assigned to the expression set. This enables the user to start using default parameters or tune the parameters from scratch (a value of CLEAR for the operation argument).

Note: This procedure is useful only when an attribute set is shared across multiple expression sets. In all other cases, the defaults assigned to the attribute set can be tuned for the expression set using it.

- See "Creating an Index from Exact Parameters" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and XPINDEX_PARAMETERS Procedure in this chapter for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_DEF_INDEX_PARAMS and USER_EXPFIL_INDEX_PARAMS.

Examples

The following command synchronizes the expression set's index parameters with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list => null,
                               operation => 'DEFAULT');
END;
```

The following command adds a stored attribute to the expression set's index parameters.

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list =>
                                exf$attribute_list (
                                 exf$attribute (
                                   attr_name => 'CrashTestRating(Model, Year)',
                                   attr_oper => exf$indexoper('all'),
                                   attr_indexed => 'FALSE')),
                               operation => 'ADD');
END;
```

The following command clears the index parameters associated with the expression set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list => null,
                               operation => 'CLEAR');
END;
```

A subsequent index creation will use the default index parameters assigned to the corresponding attribute set.

MODIFY_OPERATOR_LIST Procedure

This procedure modifies the list of common operators associated with a certain attribute in the attribute set.

Syntax

```
DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   attr_oper  IN   EXF$INDEXOPER);
```

Parameters

Table 39–16 MODIFY_OPERATOR_LIST Procedure Parameters

Parameter	Description
attr_set	The name of the attribute set
attr_name	The name of the stored or indexed attribute being modified
attr_oper	The new list of operators that are frequently used in the predicates with the attribute

Usage Notes

- The MODIFY_OPERATOR_LIST procedure modifies the operator list for the stored and indexed attributes defined in the attribute set's default index parameters. Existing Expression Filter indexes are not affected when an attribute's operator list is modified. The updated index defaults are used when a new Expression Filter index is created or when an existing index is rebuilt.
- Related views: USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command modifies the operator list associated with the HorsePower(Model,Year) attribute defined in the Car4Sale attribute set.

```
BEGIN
  DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
    attr_set => 'Car4Sale',
    attr_name => 'HorsePower(Model, Year)',
    attr_oper => exf$indexoper('=','<','>', 'between'));
END;
```

REVOKE_PRIVILEGE Procedure

This procedure revokes an expression privilege previously granted by the owner.

Syntax

```
DBMS_EXPFIL.REVOKE_PRIVILEGE (
   expr_tab   IN  VARCHAR2,
   expr_col   IN  VARCHAR2,
   priv_type  IN  VARCHAR2,
   from_user  IN  VARCHAR2);
```

Parameters

Table 39–17 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
priv_type	Type of privilege to be revoked
from_user	The user from whom the privilege is to be revoked

Usage Notes

- The REVOKE_PRIVILEGE procedure revokes an expression privilege previously granted by the owner.
- See GRANT_PRIVILEGE Procedure in this chapter and "Granting and Revoking Privileges" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The following command revokes the INSERT EXPRESSION privilege on the Interest column of the Consumer table from user SCOTT:

```
BEGIN
  DBMS_EXPFIL.REVOKE_PRIVILEGE (expr_tab  => 'Consumer',
                                 expr_col  => 'Interest',
                                 priv_type => 'INSERT EXPRESSION',
                                  from_user => 'SCOTT');
END;
```

UNASSIGN_ATTRIBUTE_SET Procedure

This procedure unassigns an attribute set from a column storing expressions.

Syntax

```
DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 39–18 UNASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
`expr_tab`	The table storing the expression set
`expr_col`	The column in the table that stores the expressions

Usage Notes

- A column of an expression datatype can be converted back to a `VARCHAR2` type by unassigning the attribute set. You can unassign an attribute set from a column storing expressions if an Expression Filter index is not defined on the column.
- See ASSIGN_ATTRIBUTE_SET Procedure in this chapter for information about assigning attribute sets.
- Related views: `USER_EXPFIL_EXPRESSION_SETS` and `USER_EXPFIL_INDEXES`.

Examples

The following command unassigns the attribute set previously assigned to the `Interest` column of the `Consumer` table. (See "Bulk Loading of Expression Data" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter*.)

```
BEGIN
  DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (expr_tab => 'Consumer',
                                      expr_col => 'Interest');
END;
```

VALIDATE_EXPRESSIONS Procedure

This procedure validates all the expressions in a set.

Syntax

```
DBMS_EXPFIL.VALIDATE_EXPRESSIONS (
   expr_tab      IN  VARCHAR2,
   expr_col      IN  VARCHAR2,
   exception_tab IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 39–19 VALIDATE_EXPRESSIONS Procedure Parameters

Parameter	Description
expr_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
exception_tab	The name of the exception table. This table is created using the BUILD_EXCEPTIONS_TABLE procedure.

Usage Notes

- The expressions stored in a table may have references to schema objects like user-defined functions and tables. When these schema objects are dropped or modified, the expressions could become invalid and the subsequent evaluation (query with EVALUATE operator) could fail.
- The VALIDATE_EXPRESSIONS procedure validates all the expressions in a set. By default, the expression validation utility fails on the first expression that is invalid. Optionally, the caller can pass an exception table to store references to all the invalid expressions. In addition to validating expressions in the set, this procedure validates the parameters (stored and indexed attributes) of the associated index and the approved list of user-defined functions. Any errors in the index parameters or the user-defined function list are immediately reported to the caller.
- See "Evaluation Semantics" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* and BUILD_EXCEPTIONS_TABLE Procedure in this chapter for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_ASET_FUNCTIONS, and USER_EXPFIL_PREDTAB_ATTRIBUTES.

Examples

The following command validates the expressions stored in the Interest column of the Consumer table.

```
BEGIN
  DBMS_EXPFIL.VALIDATE_EXPRESSIONS (expr_tab => 'Consumer',
                                    expr_col => 'Interest');
END;
```

XPINDEX_PARAMETERS Procedure

This procedure is used in conjunction with the INDEX_PARAMETERS procedure to fine-tune the XPath-specific index parameters for each expression set.

Syntax

```
DBMS_EXPFIL.XPINDEX_PARAMETERS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   xmlt_attr  IN   VARCHAR2,
   xptag_list IN   EXF$XPATH_TAGS,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 39–20 XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
exp_tab	The table storing the expression set
expr_col	The column in the table that stores the expressions
xmlt_attr	The name of the attribute with the XMLType datatype
xptag_list	An instance of EXF$XPATH_TAGS type with a partial list of XML elements and attributes
operation	The operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- When an attribute set is shared by multiple expression sets, the INDEX_PARAMETERS procedure can be used to tune the simple (non-XPath) index parameters for each expression set. The XPINDEX_PARAMETERS procedure is used in conjunction with the INDEX_PARAMETERS procedure to fine-tune the XPath-specific index parameters for each expression set.
- See also INDEX_PARAMETERS Procedure in this chapter and "Index Tuning for XPath Predicates" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.
- Related views: USER_EXPFIL_ATTRIBUTES, USER_EXPFIL_DEF_INDEX_PARAMS, and USER_EXPFIL_INDEX_PARAMS.

> **Note:** The values assigned to the tag_name argument of exf$xpath_tag type are case-sensitive.

Examples

The following command synchronizes the expression set's index parameters (XPath and non-XPath) with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'Consumer',
                               expr_col  => 'Interest',
                               attr_list => null,
                               operation => 'DEFAULT');
```

```
END;
```

The following command adds an XPath-specific index parameter to the expression set:

```
BEGIN
  DBMS_EXPFIL.XPINDEX_PARAMETERS(expr_tab   => 'Consumer',
                                 expr_col   => 'Interest',
                                 xmlt_attr  => 'Details',
                                 xptag_list =>
                                  exf$xpath_tags(
                                    exf$xpath_tag(tag_name    => 'GPS',
                                                  tag_indexed => 'TRUE',
                                                  tag_type    => NULL)),
                                 operation  => 'ADD');
END;
```

40

DBMS_FGA

The `DBMS_FGA` package provides fine-grained security functions.

This chapter contains the following topics:

Using DBMS_FGA

Security Model

Execute privilege on `DBMS_FGA` is needed for administering audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module will be executed with the module owner's privilege.

Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can refer to `DBA_FGA_AUDIT_TRAIL` to analyze the SQL text and corresponding bind variables that are issued.

Summary of DBMS_FGA Subprograms

Table 40–1 DBMS_FGA Package Subprograms

Subprogram	Description
ADD_POLICY Procedure on page 40-6	Creates an audit policy using the supplied predicate as the audit condition
DISABLE_POLICY Procedure on page 40-11	Disables an audit policy
DROP_POLICY Procedure on page 40-12	Drops an audit policy
ENABLE_POLICY Procedure on page 40-13	Enables an audit policy

ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition. The maximum number of FGA policies on any table or view object is 256.

Syntax

```
DBMS_FGA.ADD_POLICY(
   object_schema      VARCHAR2,
   object_name        VARCHAR2,
   policy_name        VARCHAR2,
   audit_condition    VARCHAR2,
   audit_column       VARCHAR2,
   handler_schema     VARCHAR2,
   handler_module     VARCHAR2,
   enable             BOOLEAN,
   statement_types    VARCHAR2,
   audit_trail        BINARY_INTEGER IN DEFAULT,
   audit_column_opts  BINARY_INTEGER IN DEFAULT);
```

Parameters

Table 40–2 ADD_POLICY Procedure Parameters

Parameter	Description	Default Value
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)	NULL
object_name	The name of the object to be audited.	-
policy_name	The unique name of the policy.	-
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.	NULL
audit_column	The columns to be checked for access. These can include hidden columns. The default, NULL, causes audit if any column is accessed or affected.	NULL
handler_schema	The schema that contains the event handler. The default, NULL, causes the current schema to be used.	NULL
handler_module	The function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.	NULL
enable	Enables the policy if TRUE, which is the default.	TRUE
statement_types	The SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only.	SELECT
audit_trail	Destination (DB or XML) of fine grained audit records. Also specifies whether to populate LSQLTEXT and LSQLBIND in fga_log$.	DB+EXTENDED
audit_column_opts	Establishes whether a statement is audited when the query references *any* column specified in the audit_column parameter or only when *all* such columns are referenced.	ANY_COLUMNS

Usage Notes

- If object_schema is not specified, the current log-on user schema is assumed.

- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. This condition can be NULL (or omitted), which is interpreted as `TRUE`, but it cannot contain the following elements:
  - Subqueries or sequences
  - Any direct use of `SYSDATE, UID, USER or USERENV` functions. However, a user-defined function and other SQL functions can use these functions to return the desired information.
  - Any use of the pseudo columns `LEVEL, PRIOR, or ROWNUM`.

  Specifying an audit condition of "1=1" to force auditing of all specified statements ("`statement_types`") affecting the specified column ("`audit_column`") is no longer needed to achieve this purpose. `NULL` will cause audit even if no rows were processed, so that all actions on a table with this policy are audited.
- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

  ```
  PROCEDURE <fname> ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
  VARCHAR2 )  AS ...
  ```

  where `fname` is the name of the procedure, `object_schema` is the name of the schema of the table audited, `object_name` is the name of the table to be audited, and `policy_name` is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.
- The `audit_trail` parameter specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):
  - If audit_trail includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\$DB_UNIQUE_NAME\adump` on Windows systems.)
  - If audit_trail includes DB instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database.
  - If audit_trail includes `EXTENDED`, then the query's SQL Text and SQL Bind variable information are included in the audit trail.
  - For example:

  * Setting audit_trail to DBMS_FGA.DB sends the audit trail to the SYS.FGA_LOG$ table in the database and omits SQL Text and SQL Bind.
  * Setting audit_trail to DBMS_FGA.DB + DBMS_FGA.EXTENDED sends the audit trail to the SYS.FGA_LOG$ table in the database and includes SQL Text and SQL Bind.
  * Setting audit_trail to DBMS_FGA.XML writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
  * Setting audit_trail to DBMS_FGA.XML + DBMS_FGA.EXTENDED writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

  The audit_trail parameter appears in the ALL_AUDIT_POLICIES view.

- You can change the operating system destination using the following command:

  ```
  ALTER SYSTEM SET AUDIT_FILE_DEST = '<New Directory>' DEFERRED
  ```

- On many platforms, XML audit files are named <process_name>_<processId>.xml, for example, ora_2111.xml, or s002_11.xml. On Windows, the XML audit files are named <process_name>_<ThreadId>.xml (or <process_name>_ProcessId>.xml if the process is not running as a thread).
- The audit_column_opts parameter establishes whether a statement is audited
  - when the query references *any* column specified in the audit_column parameter (audit_column_opts = DBMS_FGA.ANY_COLUMNS), or
  - only when *all* such columns are referenced (audit_column_opts = DBMS_FGA.ALL_COLUMNS).

  The default is DBMS_FGA.ANY_COLUMNS.

  The ALL_AUDIT_POLICIES view also shows audit_column_opts.
- When audit_column_opts is set to DBMS_FGA.ALL_COLUMNS, a SQL statement is audited only when all the columns mentioned in audit_column have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

  Also, all these columns must refer to a single table/view or alias.

  Thus, if a SQL statement selects the columns from different table aliases, the statement will not be audited.

V$XML_AUDIT_TRAIL View

The new values for the audit_trail parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

A new dynamic view, V$XML_AUDIT_TRAIL, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an .xml extension) in the AUDIT_FILE_DEST directory to be parsed and presented in relational table format.

The DBA_COMMON_AUDIT_TRAIL view includes the contents of the V$XML_AUDIT_TRAIL dynamic view for standard and fine-grained audit records.

Since the audit XML files are stored in files with extension .xml on all platforms, the dynamic view presents audit information similarly on all platforms, using the following schema:

Table 40–3 Elements in the V$XML_AUDIT_TRAIL Dynamic View

Element	Type
AUDIT_TYPE	VARCHAR2(18)
SESSION_ID	NUMBER
PROXY_SESSIONID	NUMBER
STATEMENTID	NUMBER
ENTRYID	NUMBER
EXTENDED_TIMESTAMP	TIMESTAMP(6) WITH TIME ZONE
GLOBAL_UID	VARCHAR2(32)
DB_USER	VARCHAR2(30)
CLIENT_ID	VARCHAR2(64)
EXT_NAME	VARCHAR2(4000)
OS_USER	VARCHAR2(255)
USERHOST	VARCHAR2(128)
OS_PROCESS	VARCHAR2(16)
TERMINAL	VARCHAR2(255)
INSTANCE_NUMBER	NUMBER
OBJECT_SCHEMA	VARCHAR2(30)
OBJECT_NAME	VARCHAR2(128)
POLICY_NAME	VARCHAR2(30)
STATEMENT_TYPE	VARCHAR2(28)
TRANSACTIONID	RAW(8)
SCN	NUMBER
COMMENT_TEXT	VARCHAR2(4000)
SQL_BIND	VARCHAR2(4000)
SQL_TEXT	VARCHAR2(4000)

Usage Notes

- Every XML audit record contains the elements AUDIT_TYPE and EXTENDED_TIMESTAMP, with the latter printed in UTC zone (with no timezone information). Values retrieved using V$XML_AUDIT_TRAIL view are converted to session timezone and printed.
- For SQL_TEXT and SQL_BIND element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such SQL_TEXT and SQL_BIND values.
- For large numbers of XML audit files, querying V$XML_AUDIT_TRAIL is faster when they are loaded into a database table using SQL*Loader or a similar tool. XML audit files are larger than the equivalent written to OS files when AUDIT_TRAIL=OS.

- Error handling is the same as when AUDIT_TRAIL=OS. If any error occurs in writing an audit record to disk, including the directory identified by AUDIT_FILE_DEST being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.

Examples

```
DBMS_FGA.ADD_POLICY (
   object_schema      =>  'scott',
   object_name        =>  'emp',
   policy_name        =>  'mypolicy1',
   audit_condition    =>  'sal < 100',
   audit_column       =>  'comm,sal',
   handler_schema     =>   NULL,
   handler_module     =>   NULL,
   enable             =>   TRUE,
   statement_types    =>  'INSERT, UPDATE',
   audit_trail        =>   DBMS_FGA.XML + DBMS_FGA.EXTENDED,
   audit_column_opts  =>   DBMS_FGA.ANY_COLUMNS);
```

DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```
DBMS_FGA.DISABLE_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2 );
```

Parameters

Table 40–4 DISABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

The default value for object_schema is NULL. (If NULL, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DISABLE_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

```
DBMS_FGA.DROP_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2 );
```

Parameters

Table 40–5 DROP_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema of the object to be audited. (If `NULL`, the current log-on user schema is assumed.)
`object_name`	The name of the object to be audited.
`policy_name`	The unique name of the policy.

Usage Notes

The `DBMS_FGA` procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the `DBMS_FGA` procedures are part of the DDL transaction. The default value for object_schema is `NULL`. (If `NULL`, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DROP_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2,
   enable         BOOLEAN);
```

Parameters

Table 40–6 ENABLE_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema of the object to be audited. (If `NULL`, the current log-on user schema is assumed.)
`object_name`	The name of the object to be audited.
`policy_name`	The unique name of the policy.
`enable`	Defaults to `TRUE` to enable the policy.

Examples

```
DBMS_FGA.ENABLE_POLICY (
object_schema    =>  'scott',
object_name      =>  'emp',
policy_name      =>  'mypolicy1',
enable           =>   TRUE);
```

41

DBMS_FILE_GROUP

The DBMS_FILE_GROUP package, one of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. This package can be used to create and manage file group repositories.

See Also: *Oracle Streams Concepts and Administration*

This chapter contains the following topics:

Using DBMS_FILE_GROUP

This section contains topics which relate to using the `DBMS_FILE_GROUP` package.

Overview

The following terms pertain to the DBMS_FILE_GROUP package:

File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is expdat.dmp.
- The directory object that contains the file is db_files.
- The file type is DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

Version

A **version** is a collection of related files. For example, a version might consist of a set of datafiles and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

File Group

A **file group** is a collection of versions. A file group can be used to logically group a set of versions. For example, a file group named financial_quarters can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as Q1FY04, Q2FY04, and so on.

Constants

The DBMS_FILE_GROUP package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, specify DBMS_FILE_GROUP.EXPORT_DUMP_FILE for an export dump file.

Table 41–1 DBMS_FILE_GROUP Parameters with Enumerated Constants

Parameter	Enumerated Constant	Type	Description
file_type new_file_type	■ DATAFILE ■ EXPORT_DUMP_FILE ■ DATAPUMP_LOG_FILE	VARCHAR2(30)	DATAFILE is a data file for a database. This constant can be specified as 'DATAFILE'. EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'. DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.
max_versions retention_days	■ INFINITE	NUMBER	INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.
privilege	System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure: ■ READ_ANY_FILE_GROUP ■ MANAGE_ANY_FILE_GROUP ■ MANAGE_FILE_GROUP Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure: ■ READ_ON_FILE_GROUP ■ MANAGE_ON_FILE_GROUP	BINARY_INTEGER	READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary. MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema. MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema. READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary. MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.

Summary of DBMS_FILE_GROUP Subprograms

Table 41–2 DBMS_FILE_GROUP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 41-6	Adds a file to a version of a file group
ALTER_FILE Procedure on page 41-8	Alters a file in a version of a file group
ALTER_FILE_GROUP Procedure on page 41-10	Alters a file group
ALTER_VERSION Procedure on page 41-12	Alters a version of a file group
CREATE_FILE_GROUP Procedure on page 41-14	Creates a file group
CREATE_VERSION Procedure on page 41-16	Creates a version of a file group
DROP_FILE_GROUP Procedure on page 41-17	Drops a file group
DROP_VERSION Procedure on page 41-18	Drops a version of a file group
GRANT_OBJECT_PRIVILEGE Procedure on page 41-19	Grants object privileges on a file group to a user
GRANT_SYSTEM_PRIVILEGE Procedure on page 41-20	Grants system privileges for file group operations to a user
PURGE_FILE_GROUP Procedure on page 41-21	Purges a file group using the file group's retention policy
REMOVE_FILE Procedure on page 41-22	Removes a file from a version of a file group
REVOKE_OBJECT_PRIVILEGE Procedure on page 41-23	Revokes object privileges on a file group from a user
REVOKE_SYSTEM_PRIVILEGE Procedure on page 41-24	Revokes system privileges for file group operations from a user

Note: All subprograms commit unless specified otherwise.

ADD_FILE Procedure

This procedure adds a file to a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  file_type        IN  VARCHAR2  DEFAULT NULL,
  file_directory   IN  VARCHAR2  DEFAULT NULL,
  version_name     IN  VARCHAR2  DEFAULT NULL,
  comments         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 41–3 ADD_FILE Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group that contains the version, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`file_name`	The name of the file being added to the version. Each file name in a version must be unique.

`file_type`	The file type. The following are reserved file types:
	■ If the file is a datafile, then enter the following:
	`'DATAFILE'`
	■ If the file is a Data Pump export dump file, then enter the following:
	`'DUMPSET'`
	Data Pump metadata is populated when a Data Pump export dump file is imported.
	■ If the file is a Data Pump export log file, then enter the following:
	`'DATAPUMPLOG'`
	If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify `NULL` to omit a file type description.
	See "Constants" on page 41-4 for more information about the reserved file types.

`file_directory`	The name of the directory object that corresponds to the directory containing the file. If `NULL`, then the procedure uses the default directory object for the version. If `NULL` and no default directory object exists for the version, then the procedure uses the default directory object for the file group. If `NULL` and no default directory object exists for the version or file group, then the procedure raises an error.

Table 41–3 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
version_name	The name of the version to which the file is added. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group. If NULL, then the procedure uses the version with the latest creation time for the file group.
comments	Comments about the file being added

Usage Notes

To run this procedure with either DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name     IN  VARCHAR2,
  file_name           IN  VARCHAR2,
  version_name        IN  VARCHAR2  DEFAULT NULL,
  new_file_name       IN  VARCHAR2  DEFAULT NULL,
  new_file_directory  IN  VARCHAR2  DEFAULT NULL,
  new_file_type       IN  VARCHAR2  DEFAULT NULL,
  remove_file_type    IN  VARCHAR2  DEFAULT 'N',
  new_comments        IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 41–4 ALTER_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name. **Note:** When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.
new_file_directory	The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If NULL, then the procedure does not change the directory object name. **Note:** When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.

Table 41–4 (Cont.) ALTER_FILE Procedure Parameters

Parameter	Description
new_file_type	The file type. The following are reserved file types: ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' If the file type is not one of the reserved file types, then enter a text description of the file type. If NULL, then the procedure does not change the file type. **See Also:** "Constants" on page 41-4 for more information about the reserved file types.
remove_file_type	If Y, then the procedure removes the file type. If Y and the new_file_type parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not remove the file type.
new_comments	New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the procedure removes the comments for the file. If Y and the new_comments parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not change the existing comments.

Usage Notes

If the file type is changed to DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the new_file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP(
  file_group_name           IN  VARCHAR2,
  keep_files                IN  VARCHAR2  DEFAULT NULL,
  min_versions              IN  NUMBER    DEFAULT NULL,
  max_versions              IN  NUMBER    DEFAULT NULL,
  retention_days            IN  NUMBER    DEFAULT NULL,
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 41–5 ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being altered, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. If NULL, then this parameter is not changed. **Note:** If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1. If NULL, then the procedure does not change the min_versions setting for the file group.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions. If NULL, then the procedure does not change the max_versions setting for the file group.

Table 41–5 (Cont.) ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist. If NULL, then the procedure does not change the retention_days setting for the file group.
new_default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory for the file group. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory for the file group.
new_comments	Comments about the file group. If non-NULL, then the new comments replace the existing comments for the file group. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the comments for the file group are removed. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not change the comments for the file group.

Usage Notes

If min_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set min_versions to at least 2 if a version of the file group must be available at all times.

ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name           IN  VARCHAR2,
  version_name              IN  VARCHAR2  DEFAULT NULL,
  new_version_name          IN  VARCHAR2  DEFAULT NULL,
  remove_version_name       IN  VARCHAR2  DEFAULT 'N',
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 41–6 ALTER_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the new_version_name parameter must be NULL. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_version_name	The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If NULL, then the procedure does not change the version name.
remove_version_name	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the new_version_name parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the version name.
new_default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.

Table 41–6 (Cont.) ALTER_VERSION Procedure Parameters

Parameter	Description
new_comments	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
remove_comments	If Y, then the procedure removes the comments for the version. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

CREATE_FILE_GROUP Procedure

This procedure creates a file group.

Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP(
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER    DEFAULT 2,
  max_versions       IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory  IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 41–7 CREATE_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. **Note:** If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.
comments	Comments about the file group being created.

Usage Notes

If `min_versions` is set to `1`, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least `2` if a version of the file group must be available at all times.

CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the PURGE_FILE_GROUP procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the OUT parameter version_out, and the other does not.

See Also: "PURGE_FILE_GROUP Procedure" on page 41-21

Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN  VARCHAR2,
  version_name       IN  VARCHAR2 DEFAULT NULL,
  default_directory  IN  VARCHAR2 DEFAULT NULL,
  comments           IN  VARCHAR2 DEFAULT NULL);

DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN   VARCHAR2,
  version_name       IN   VARCHAR2 DEFAULT NULL,
  default_directory  IN   VARCHAR2 DEFAULT NULL,
  comments           IN   VARCHAR2 DEFAULT NULL,
  version_out        OUT  VARCHAR2);
```

Parameters

Table 41–8 CREATE_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group to which the new version is added, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk ('*').
default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added.
comments	Comments about the version being created
version_out	If the version_name parameter is set to a non-NULL value, then this parameter contains the specified version name. If the version_name parameter is set to NULL, then this parameter contains the generated version number.

DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(
  file_group_name  IN  VARCHAR2,
  keep_files       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 41–9 DROP_FILE_GROUP Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group being dropped, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`keep_files`	If `Y`, then the procedure retains the files in the file group on hard disk. If `N`, then the procedure deletes the files in the file group from hard disk. If `NULL`, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_files       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 41–10 DROP_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped. If NULL, then the procedure uses the version with the oldest creation time for the file group. If '*', then the procedure drops all versions.
keep_files	If Y, then the procedure retains the files in the version on hard disk. If N, then the procedure deletes the files in the version from hard disk. If NULL, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name   IN  VARCHAR2,
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 41–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`object_name`	The name of the file group on which the privilege is granted, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`privilege`	The constant that specifies the privilege. See "Constants" on page 41-4 for valid privileges.
`grantee`	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
`grant_option`	If `TRUE`, then the specified user granted the specified privilege can grant this privilege to others. If `FALSE`, then the specified user granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

> **Note:** When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.
>
> If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS. Set the O7_DICTIONARY_ACCESSIBILITY initialization parameter with caution.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 41–12 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The constant that specifies the privilege. See "Constants" on page 41-4 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group except when purging a version will cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
  file_group_name  IN  VARCHAR2);
```

Parameter

Table 41–13 PURGE_FILE_GROUP Procedure Parameter

Parameter	Description
`file_group_name`	The name of the file group, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default. If `NULL` and this procedure is run by `SYS` user, then the procedure purges all file groups.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_file        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 41–14 REMOVE_FILE Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group that contains the version, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`file_name`	The name of the file being removed from the version
`version_name`	The name of the version from which the file is removed. If a positive integer is specified as a `VARCHAR2` value, then the integer is interpreted as a version number. For example, if `'1'` is specified, then the file is removed from version 1 of the file group. If `NULL`, then the procedure uses the version with the latest creation time for the file group. If `'*'`, then the procedure removes the file from all versions.
`keep_file`	If `Y`, then the procedure retains the file on hard disk. If `N`, then the procedure deletes the file from hard disk. If `NULL`, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  revokee      IN  VARCHAR2);
```

Parameters

Table 41–15 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`object_name`	The name of the file group on which the privilege is revoked, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`privilege`	The constant that specifies the privilege. See "Constants" on page 41-4 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(
  privilege  IN  BINARY_INTEGER,
  revokee    IN  VARCHAR2);
```

Parameters

Table 41–16 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The constant that specifies the privilege. See "Constants" on page 41-4 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

42

DBMS_FILE_TRANSFER

The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

See Also:

- *Oracle Database Concepts* for conceptual information about file transfer
- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

This chapter contains the following topic:

Using DBMS_FILE_TRANSFER

Operating Notes

Caution: `DBMS_FILE_TRANSFER` supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

Summary of DBMS_FILE_TRANSFER Subprograms

Table 42–1 DBMS_FILE_TRANSFER Package Subprograms

Subprogram	Description
COPY_FILE Procedure on page 42-5	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
GET_FILE Procedure on page 42-7	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
PUT_FILE Procedure on page 42-9	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2);
```

Parameters

Table 42–2 COPY_FILE Procedure Parameters

Parameter	Description
`source_directory_object`	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the `CREATE DIRECTORY` command).
`source_file_name`	The name of the file to copy. This file must exist in the source directory.
`destination_directory_object`	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, `+diskgroup1`) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: `+diskgroup1/dbs/control`).
`destination_file_name`	The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM: ■ The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type) ■ The file type tag assigned to the file is `COPY_FILE` ■ The value of the `destination_file_name` argument becomes the file's alias name in the designated destination directory The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- `READ` privilege on the directory object specified in the `source_directory_object` parameter
- `WRITE` privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

> **See Also:** *Oracle Database Administrator's Guide* for instructions about using file transfer

Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';

Directory created.

SQL>  BEGIN
   2    DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR','t_xdbtmp.f', 'DGROUP',
                                     't_xdbtmp.f');
   3  END;
   4  /

PL/SQL procedure successfully completed.

SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
   source_directory_object      IN  VARCHAR2,
   source_file_name             IN  VARCHAR2,
   source_database              IN  VARCHAR2,
   destination_directory_object IN  VARCHAR2,
   destination_file_name        IN  VARCHAR2);
```

Parameters

Table 42–3 GET_FILE Procedure Parameters

Parameter	Description
`source_directory_object`	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
`source_file_name`	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
`source_database`	The name of a database link to the remote database where the file is located.
`destination_directory_object`	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
`destination_file_name`	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the `source_directory_object` parameter.
- The current user at the local database must have write privilege on the directory object specified in the `destination_directory_object` parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS ''^t_work^'';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- asumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/
```

PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2,
   destination_database          IN  VARCHAR2);
```

Parameters

Table 42–4 PUT_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the source_directory_object parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user/password@inst1

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
 DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                               'dbs2' ) ;
END ;
```

43

DBMS_FLASHBACK

Using DBMS_FLASHBACK, you can flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)

> **See Also:** For detailed information about DBMS_FLASHBACK:
>
> - *Oracle Database Application Developer's Guide - Fundamentals*
> - *Oracle Database SQL Reference* .

This chapter contains the following topics:

Using DBMS_FLASHBACK

Overview

When DBMS_FLASHBACK is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use DBMS_FLASHBACK for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover the deleted rows.
- Packaged applications such as e-mail and voicemail: You can use Flashback to restore deleted e-mail by re-inserting the deleted message into the current message box.
- Decision support system (DSS) and online analytical processing (OLAP) applications: You can perform data analysis or data modeling to track seasonal demand.

Security Model

To use this package, a database administrator must grant `EXECUTE` privileges for `DBMS_FLASHBACK`.

Exceptions

Table 43–1 DBMS_FLASHBACK Error Messages

Error	Description
ORA-08180	Time specified is too old.
ORA-08181	Invalid system change number specified.
ORA-08182	User cannot begin read-only or serializable transactions in Flashback mode.
ORA-08183	User cannot enable Flashback within an uncommitted transaction.
ORA-08184	User cannot enable Flashback within another Flashback session.
ORA-08185	SYS cannot enable Flashback mode.

Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need.

If you need to perform a Flashback over a 24-hour period, the DBA should set the undo_retention parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the RETENTION GUARANTEE clause for the undo tablespace to ensure that unexpired undo is not discarded.UNDO_RETENTION is not in itself a complete guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, RETENTION GUARANTEE prevents this. For more information, see the *Oracle Database Administrator's Guide*

In a Flashback-enabled session, SYSDATE will not be affected; it will continue to provide the current time.

DBMS_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```
DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
   employee_no   number(5) PRIMARY KEY,
   employee_name varchar2(20),
   employee_mgr  number(5)
      CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
   salary        number,
   hiredate      date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20  seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;
```

```
REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Flashback to see Scott's organization
DECLARE
   restore_scn number;
BEGIN
   SELECT  scn INTO restore_scn FROM keep_scn;
   DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (restore_scn);
END;
/

REM -- Show Scott's org.
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no =
   (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger')
ORDER BY LEVEL;

REM -- Restore scott's organization.
DECLARE
   scotts_emp NUMBER;
   scotts_mgr NUMBER;
   CURSOR c1 IS
      SELECT employee_no, employee_name, employee_mgr, salary, hiredate
      FROM employee
      CONNECT BY PRIOR employee_no = employee_mgr
      START WITH employee_no =
         (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger');
   c1_rec c1 % ROWTYPE;
BEGIN
   SELECT employee_no, employee_mgr INTO scotts_emp, scotts_mgr FROM employee
   WHERE employee_name = 'Scott Tiger';
   /* Open c1 in flashback mode */
   OPEN c1;
   /* Disable Flashback */
   DBMS_FLASHBACK.DISABLE;
 LOOP
   FETCH c1 INTO c1_rec;
   EXIT WHEN c1%NOTFOUND;
   /*
     Note that all the DML operations inside the loop are performed
     with Flashback disabled
   */
   IF (c1_rec.employee_mgr = scotts_emp) then
      INSERT INTO employee VALUES (c1_rec.employee_no,
         c1_rec.employee_name,
         scotts_mgr,
         c1_rec.salary,
         c1_rec.hiredate);
   ELSE
   IF (c1_rec.employee_no != scotts_emp) THEN
   INSERT INTO employee VALUES (c1_rec.employee_no,
         c1_rec.employee_name,
```

```
        c1_rec.employee_mgr,
        c1_rec.salary,
        c1_rec.hiredate);
      END IF;
    END IF;
 END LOOP;
END;
/

REM -- Show the restored organization.
select lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;
```

Summary of DBMS_FLASHBACK Subprograms

Table 43–2 DBMS_FLASHBACK Package Subprograms

Subprogram	Description
DISABLE Procedure on page 43-11	Disables the Flashback mode for the entire session
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure on page 43-12	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries will return data consistent as of the specified wall-clock time or SCN
ENABLE_AT_TIME Procedure on page 43-13	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`
GET_SYSTEM_CHANGE_NUMBER Function on page 43-14	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
SCN_TO_TIMESTAMP Function on page 43-15	Takes the current SCN as an Oracle number datatype and returns a `TIMESTAMP`.
TIMESTAMP_TO_SCN Function on page 43-16	Takes a `TIMESTAMP` as input and returns the current SCN as an Oracle number datatype

DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

```
DBMS_FLASHBACK.DISABLE;
```

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;
```

ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
   query_scn IN NUMBER);
```

Parameters

Table 43–3 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in query_time.It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
   query_time   IN TIMESTAMP);
```

Parameters

Table 43–4 ENABLE_AT_TIME Procedure Parameters

Parameter	Description
query_time	This is an input parameter of type TIMESTAMP. A time stamp can be specified in the following ways: ■ Using the TIMESTAMP constructor EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00'). Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings. ■ Using the TO_TIMESTAMP function: EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS')) You provide the format you want to use. This example shows the TO_TIMESTAMP function for February 12, 2001, 2:35 PM. ■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. ■ Note that if the query time contains a time zone, the time zone information is truncated.

GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
 RETURN NUMBER;
```

SCN_TO_TIMESTAMP Function

This function takes the SCN as an Oracle number datatype and returns the corresponding `TIMESTAMP`.

Syntax

```
DBMS_FLASHBACK.SCN_TO_TIMESTAMP
  query_scn  IN        NUMBER)
RETURN TIMESTAMP;
```

Parameters

Table 43–5 SCN_TO_TIMESTAMP Procedure Parameters

Parameter	Description
`query_scn`	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

TIMESTAMP_TO_SCN Function

This function takes a TIMESTAMP as input and returns the corresponding SCN as an Oracle number datatype.

Syntax

```
DBMS_FLASHBACK.TIMESTAMP_TO_SCN
  query_time    IN        TIMESTAMP
RETURN NUMBER);
```

Parameters

Table 43–6 TIMESTAMP_TO_SCN Procedure Parameters

Parameter	Description

query_time	This is an input parameter of type TIMESTAMP. A time stamp can be specified in the following ways:
	■ Using the TIMESTAMP constructor
	`EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00')`
	Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.
	■ Using the TO_TIMESTAMP function:
	`EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))`
	You provide the format you want to use. This example shows the TO_TIMESTAMP function for February 12, 2001, 2:35 PM.
	■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M.
	■ Note that if the query time contains a time zone, the time zone information is truncated.

44

DBMS_FREQUENT_ITEMSET

The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

Summary of DBMS_FREQUENT_ITEMSET Subprograms

Table 44–1 DBMS_FREQUENT_ITEMSET Package Subprograms

Subprogram	Description
FI_HORIZONTAL Function on page 44-3	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
FI_TRANSACTIONAL Function on page 44-5	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 44–2 FI_HORIZONTAL Procedure Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns.Each column of cursor represents an item. All columns of the cursor must be of the same data type. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned.The default is NULL.

Return Values

Table 44–3 FI_HORIZONTAL Procedure Parameters

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

Example

Suppose you have a table horiz_table_in.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in horiz_table_in looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
                CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
                         FROM horiz_table_in),
                0.3,
                2,
                5,
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                    ('apple','banana','orange'))),
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk')))));
```

FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 44–4 FI_TRANSACTIONAL Procedure Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

Return Values

Table 44–5 FI_TRANSACTIONAL Procedure Parameters

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table tranx_table_in looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of VARCHAR2(30), you must create a nested table of VARCHAR2(30):

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                cursor(SELECT tid, iid FROM tranx_table_in),
                0.6,
                2,
                5,
                NULL,
                NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                CURSOR(SELECT tid, iid FROM tranx_table_in),
```

```
              0.6,
              2,
              5,
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                        ('apple','banana','orange'))),
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```
SELECT
  bt.setid, nt.*
FROM
(SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
 FROM table(
   DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
     CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
     NULL, NULL))) bt,
table(bt.itemset) nt;
```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the `NESTED_TABLE_FAST_INSERT` hint for performance:

```
CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */  INTO fq_nt
 SELECT cast(itemset as FI_VARCHAR_NT)
 FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL));
```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```
CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP
```

```
      FETCH freqC INTO coll_nt;
      EXIT WHEN freqC%NOTFOUND;
      num_rows := num_rows + 1;
      num_itms := num_itms + coll_nt.count;
    END LOOP;
  CLOSE freqC;
  DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
END;
/
```

45

DBMS_HS_PASSTHROUGH

The pass-through SQL feature allows an application developer to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows for operations in statements for which there is no equivalent in Oracle.

You can run these statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is run in the same transaction as regular "transparent" SQL statements.

This chapter discusses the following topic:

- Summary of DBMS_HS_PASSTHROUGH Subprograms

> **See Also:** *Oracle Database Heterogeneous Connectivity Administrator's Guide*

Summary of DBMS_HS_PASSTHROUGH Subprograms

Table 45–1 DBMS_HS_PASSTHROUGH Package Subprograms

Subprogram	Description
BIND_INOUT_VARIABLE Procedure on page 45-3	Binds `IN OUT` bind variables
BIND_INOUT_VARIABLE_ RAW Procedure on page 45-4	Binds `IN OUT` bind variables of datatype `RAW`
BIND_OUT_VARIABLE Procedure on page 45-5	Binds an `OUT` variable with a PL/SQL program variable
BIND_OUT_VARIABLE_RAW Procedure on page 45-6	Binds an `OUT` variable of datatype `RAW` with a PL/SQL program variable
BIND_VARIABLE Procedure on page 45-7	Binds an `IN` variable positionally with a PL/SQL program variable
BIND_VARIABLE_RAW Procedure on page 45-8	Binds `IN` variables of type `RAW`
CLOSE_CURSOR Procedure on page 45-9	Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system
EXECUTE_IMMEDIATE Procedure on page 45-10	Runs a (non-`SELECT`) SQL statement immediately, without bind variables
EXECUTE_NON_QUERY Function on page 45-11	Runs a (non-`SELECT`) SQL statement
FETCH_ROW Function on page 45-12	Fetches rows from a query
GET_VALUE Procedure on page 45-13	Retrieves column value from `SELECT` statement, or retrieves `OUT` bind parameters
GET_VALUE_RAW Procedure on page 45-14	Similar to `GET_VALUE`, but for datatype `RAW`
OPEN_CURSOR Function on page 45-15	Opens a cursor for running a passthrough SQL statement at the non-Oracle system
PARSE Procedure on page 45-16	Parses SQL statement at non-Oracle system

BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (
   c     IN     BINARY_INTEGER NOT NULL,
   p     IN     BINARY_INTEGER NOT NULL,
   v     IN OUT <dty>,
   n     IN     VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For binding IN OUT variables of datatype RAW see BIND_INOUT_VARIABLE_RAW Procedure on page 45-4.

Parameters

Table 45–2 BIND_INOUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–3 BIND_INOUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_INOUT_VARIABLE_RAW Procedure

This procedure binds IN OUT bind variables of datatype RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
   c      IN     BINARY_INTEGER NOT NULL,
   p      IN     BINARY_INTEGER NOT NULL,
   v      IN OUT RAW,
   n      IN     VARCHAR2);
```

Parameters

Table 45–4 BIND_INOUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–5 BIND_INOUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_OUT_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
   c      IN  BINARY_INTEGER NOT NULL,
   p      IN  BINARY_INTEGER NULL,
   v      OUT <dty>,
   n      IN  VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For binding OUT variables of datatype RAW, see BIND_OUT_VARIABLE_RAW Procedure on page 45-6.

Parameters

Table 45–6 BIND_OUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–7 BIND_OUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an OUT variable of datatype RAW with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
   c     IN  BINARY_INTEGER NOT NULL,
   p     IN  BINARY_INTEGER NOT NULL,
   v     OUT RAW,
   n     IN  VARCHAR2);
```

Parameters

Table 45–8 BIND_OUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–9 BIND_OUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
   c      IN BINARY_INTEGER NOT NULL,
   p      IN BINARY_INTEGER NOT NULL,
   v      IN <dty>,
   n      IN VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** To bind RAW variables use BIND_VARIABLE_RAW Procedure on page 45-8.

Parameters

Table 45–10 BIND_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable name.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–11 BIND_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined: WNDS, RNDS
```

BIND_VARIABLE_RAW Procedure

This procedure binds IN variables of type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
   c    IN BINARY_INTEGER NOT NULL,
   p    IN BINARY_INTEGER NOT NULL,
   v    IN RAW,
   n    IN VARCHAR2);
```

Parameters

Table 45–12 BIND_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 45–13 BIND_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

CLOSE_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (
   c IN BINARY_INTEGER NOT NULL);
```

Parameters

Table 45–14 CLOSE_CURSOR Procedure Parameters

Parameter	Description
c	Cursor to be released.

Exceptions

Table 45–15 CLOSE_CURSOR Procedure Exceptions

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately. The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN_CURSOR, PARSE, EXECUTE_NON_QUERY, CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
   s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 45–16 EXECUTE_IMMEDIATE Procedure Parameters

Parameter	Description
s	VARCHAR2 variable with the statement to be executed immediately.

Return Values

The number of rows affected by the execution of the SQL statement.

Exceptions

Table 45–17 EXECUTE_IMMEDIATE Procedure Exceptions

Exception	Description
ORA-28551	SQL statement is invalid.
ORA-28554	Max open cursors.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a SELECT statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (
   c IN BINARY_INTEGER NOT NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 45–18 EXECUTE_NON_QUERY Function Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.

Return Values

The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

Table 45–19 EXECUTE_NON_QUERY Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	BIND_VARIABLE procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A NULL value was passed for a NOT NULL parameter.

FETCH_ROW Function

This function fetches rows from a result set. The result set is defined with a SQL SELECT statement. When there are no more rows to be fetched, the exception NO_DATA_FOUND is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
   c   IN BINARY_INTEGER NOT NULL,
   f   IN BOOLEAN)
  RETURN BINARY_INTEGER;
```

Parameters

Table 45–20 FETCH_ROW Function Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
first	(Optional) Reexecutes SELECT statement. Possible values: – TRUE: reexecute SELECT statement. – FALSE: fetch the next row, or if run for the first time, then execute and fetch rows (default).

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

Table 45–21 FETCH_ROW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

GET_VALUE Procedure

This procedure has two purposes:

- It retrieves the select list items of SELECT statements, after a row has been fetched.
- It retrieves the OUT bind values, after the SQL statement has been run.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
   c      IN  BINARY_INTEGER NOT NULL,
   p    IN  BINARY_INTEGER NOT NULL,
   v    OUT <dty>);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For retrieving values of datatype RAW, see GET_VALUE_RAW Procedure on page 45-14.

Parameters

Table 45–22 GET_VALUE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable or select list item stores its value.

Exceptions

Table 45–23 GET_VALUE Procedure Exceptions

Exception	Description
ORA-1403	Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

GET_VALUE_RAW Procedure

This procedure is similar to GET_VALUE, but for datatype RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
   c    IN  BINARY_INTEGER NOT NULL,
   p    IN  BINARY_INTEGER NOT NULL,
   v    OUT RAW);
```

Parameters

Table 45–24 GET_VALUE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable or select list item stores its value.

Exceptions

Table 45–25 GET_VALUE_RAW Procedure Exceptions

Exception	Description
ORA-1403	Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

OPEN_CURSOR Function

This function opens a cursor for running a pass-through SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure `CLOSE_CURSOR`.

Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
  RETURN BINARY_INTEGER;
```

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

Table 45–26 OPEN_CURSOR Function Exceptions

Exception	Description
`ORA-28554`	Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' `OPEN_CURSORS` initialization parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

PARSE Procedure

This procedure parses SQL statement at non-Oracle system.

Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
   c       IN  BINARY_INTEGER NOT NULL,
   stmt    IN  VARCHAR2 NOT NULL);
```

Parameters

Table 45–27 PARSE Procedure Parameters

Parameter	Description
c	Cursor associated with the pass-through SQL statement. Cursor must be opened using function OPEN_CURSOR.
stmt	Statement to be parsed.

Exceptions

Table 45–28 PARSE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28551	SQL statement is illegal.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

46

DBMS_IOT

The DBMS_IOT package creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command. DBMS_IOT can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the enable_constraint operation.

DBMS_IOT is not loaded during database installation. To install DBMS_IOT, run dbmsiotc.sql, available in the ADMIN directory.

This chapter contains the following topics:

> **Note:** With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

Summary of DBMS_IOT Subprograms

Table 46–1 DBMS_IOT Package Subprograms

Subprogram	Description
BUILD_CHAIN_ROWS_TABLE Procedure on page 46-3	Creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command
BUILD_EXCEPTIONS_TABLE Procedure on page 46-4	Creates an exception table into which rows of an index-organized table that violate a constraint can be placed

BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command.

Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
   owner               IN VARCHAR2,
   iot_name            IN VARCHAR2,
   chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

Parameters

Table 46–2 BUILD_CHAIN_ROWS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
chainrow_table_name	Intended name for the chained-rows table.

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS','L','LC');
```

A chained-row table is created with the following columns:

```
Column Name                    Null?    Type
------------------------------ -------- ----
OWNER_NAME                              VARCHAR2(30)
TABLE_NAME                              VARCHAR2(30)
CLUSTER_NAME                            VARCHAR2(30)
PARTITION_NAME                          VARCHAR2(30)
SUBPARTITION_NAME                       VARCHAR2(30)
HEAD_ROWID                              ROWID
TIMESTAMP                               DATE
A                                       CHAR(16)
B                                       CHAR(16)
C                                       CHAR(16)
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates an exception table into which rows of an index-organized table that violate a constraint can be placed during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
   owner                 IN VARCHAR2,
   iot_name              IN VARCHAR2,
   exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

Parameters

Table 46–3 BUILD_EXCEPTIONS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
exceptions_table_name	Intended name for exception-table.

Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS','L','LE');
```

An exception table for the preceding index-organized table with the following columns:

```
Column Name                    Null?    Type
------------------------------ -------- ----
ROW_ID                                  VARCHAR2(30)
OWNER                                   VARCHAR2(30)
TABLE_NAME                              VARCHAR2(30)
CONSTRAINT                              VARCHAR2(30)
A                                       CHAR(16)
B                                       CHAR(16)
C                                       CHAR(16)
```

47

DBMS_JAVA

The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

- Documentation of DBMS_JAVA

Documentation of DBMS_JAVA

For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the *Oracle Database Java Developer's Guide.*

48

DBMS_JOB

The DBMS_JOB package schedules and manages jobs in the job queue.

> **Note:** The DBMS_JOB package has been superseded by the DBMS_SCHEDULER package. In particular, if you are administering jobs to manage system load, you should consider disabling DBMS_JOB by revoking the package execution privilege for users.
>
> For more information, see Chapter 93, "DBMS_SCHEDULER" and "Moving from DBMS_JOB to DBMS_SCHEDULER" in *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

Using DBMS_JOB

Security Model

No specific system privileges are required to use DBMS_JOB. No system privileges are available to manage DBMS_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

Operational Notes

Working with Real Application Clusters

DBMS_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the DBMS_SCHEDULER package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

DBMS_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(
   job       OUT    BINARY_INTEGER,
   what      IN     VARCHAR2, NEXT_DATE IN DATE DEFAULTSYSDATE,
   interval  IN     VARCHAR2 DEFAULT 'NULL',
   no_parse  IN     BOOLEAN DEFAULT FALSE,
   instance  IN     BINARY_INTEGER DEFAULT ANY_INSTANCE,
   force     IN     BOOLEAN DEFAULT FALSE);
```

Use the parameters instance and force to control job and instance affinity. The default value of instance is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the instance value. Oracle displays error ORA-23319 if the instance value is a negative number or NULL.

The force parameter defaults to false. If force is TRUE, any positive integer is acceptable as the job instance. If force is FALSE, the specified instance must be running, or Oracle displays error number ORA-23428.

DBMS_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE(  JOB IN BINARY_INTEGER,
  instance                IN BINARY_INTEGER,
  force                   IN BOOLEAN DEFAULT FALSE);
```

The FORCE parameter in this example defaults to FALSE. If the instance value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of force. If the INSTANCE value is positive and the FORCE parameter is FALSE, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the force parameter is TRUE, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the instance value is negative or NULL.

DBMS_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE(  JOB IN BINARY_INTEGER,
```

```
   what                 IN VARCHAR2 DEFAULT NULL,
next_date             IN DATE DEFAULT NULL,
interval              IN VARCHAR2 DEFAULT NULL,
instance              IN BINARY_INTEGER DEFAULT NULL,
force                 IN BOOLEAN DEFAULT FALSE );
```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the `instance` number is negative.

DBMS_JOB.RUN

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If force is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if force is `FALSE` and the connected instance is the incorrect instance.

```
DBMS_JOB.RUN(
   job    IN BINARY_INTEGER,
   force  IN BOOLEAN DEFAULT FALSE);
```

Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.

Summary of DBMS_JOB Subprograms

Table 48–1 DBMS_JOB Package Subprograms

Subprogram	Description
BROKEN Procedure on page 48-7	Disables job execution
CHANGE Procedure on page 48-8	Alters any of the user-definable parameters associated with a job
INSTANCE Procedure on page 48-9	Assigns a job to be run by a instance
INTERVAL Procedure on page 48-10	Alters the interval between executions for a specified job
NEXT_DATE Procedure on page 48-11	Alters the next execution time for a specified job
REMOVE Procedure on page 48-12	Removes specified job from the job queue
RUN Procedure on page 48-13	Forces a specified job to run
SUBMIT Procedure on page 48-14	Submits a new job to the job queue
USER_EXPORT Procedures on page 48-16	Re-creates a given job for export, or re-creates a given job for export with instance affinity
WHAT Procedure on page 48-17	Alters the job description for a specified job

BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

Syntax

```
DBMS_JOB.BROKEN (
   job       IN  BINARY_INTEGER,
   broken    IN  BOOLEAN,
   next_date IN  DATE DEFAULT SYSDATE);
```

Parameters

Table 48–2 BROKEN Procedure Parameters

Parameter	Description
job	Number of the job being run.
broken	Job broken: IN value is FALSE.
next_data	Date of the next refresh.

> **Note:** If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```
DBMS_JOB.CHANGE (
   job       IN  BINARY_INTEGER,
   what      IN  VARCHAR2,
   next_date IN  DATE,
   interval  IN  VARCHAR2,
   instance  IN  BINARY_INTEGER DEFAULT NULL,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–3 CHANGE Procedure Parameters

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.
next_date	Date of the next refresh.
interval	Date function; evaluated immediately before the job starts running.
instance	When a job is submitted, specifies which instance can run the job. This defaults to NULL, which indicates that instance affinity is not changed.
force	If this is FALSE, then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is TRUE, then any positive integer is acceptable as the job instance.

Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- The parameters instance and force are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters what, next_date, or interval are NULL, then leave that value as it is.

Example

```
BEGIN
   DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
   COMMIT;
END;
```

INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```
DBMS_JOB.INSTANCE (
   job        IN BINARY_INTEGER,
   instance   IN BINARY_INTEGER,
   force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–4 INSTANCE Procedure Parameters

Parameter	Description
job	Number of the job being run.
instance	When a job is submitted, a user can specify which instance can run the job.
force	If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

```
DBMS_JOB.INTERVAL (
   job       IN  BINARY_INTEGER,
   interval  IN  VARCHAR2);
```

Parameters

Table 48–5 INTERVAL Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`interval`	Date function, evaluated immediately before the job starts running.

Usage Notes

- If the job completes successfully, then this new date is placed in `next_date`. `interval` is evaluated by plugging it into the statement select `interval` into `next_date` from dual;
- The `interval` parameter must evaluate to a time in the future. Legal intervals include:

Interval	Description
`'sysdate + 7'`	Run once a week.
`'next_day(sysdate,''TUESDAY'')'`	Run once every Tuesday.
`'null'`	Run only once.

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- You must issue a `COMMIT` statement immediately after the statement.

NEXT_DATE Procedure

This procedure changes when an existing job next runs.

Syntax

```
DBMS_JOB.NEXT_DATE (
   job       IN  BINARY_INTEGER,
   next_date IN  DATE);
```

Parameters

Table 48–6 NEXT_DATE Procedure Parameters

Parameter	Description
job	Number of the job being run.
next_date	Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

Syntax

```
DBMS_JOB.REMOVE (
   job       IN  BINARY_INTEGER );
```

Parameters

Table 48–7 REMOVE Procedure Parameters

Parameter	Description
job	Number of the job being run.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

Example

```
BEGIN
   DBMS_JOB.REMOVE(14144);
   COMMIT;
END;
```

RUN Procedure

This procedure runs job `JOB` now. It runs it even if it is broken.

Running the job recomputes `next_date`. See view `user_jobs`.

Syntax

```
DBMS_JOB.RUN (
   job       IN  BINARY_INTEGER,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–8 RUN Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`force`	If this is `TRUE`, then instance affinity is irrelevant for running jobs in the foreground process. If this is `FALSE`, then the job can be run in the foreground only in the specified instance.

Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

Caution: This re-initializes the current session's packages.

Exceptions

An exception is raised if `force` is `FALSE`, and if the connected instance is the wrong one.

SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

Syntax

```
DBMS_JOB.SUBMIT (
   job       OUT BINARY_INTEGER,
   what      IN  VARCHAR2,
   next_date IN  DATE DEFAULT sysdate,
   interval  IN  VARCHAR2 DEFAULT 'null',
   no_parse  IN  BOOLEAN DEFAULT FALSE,
   instance  IN  BINARY_INTEGER DEFAULT any_instance,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48–9 SUBMIT Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`what`	PL/SQL procedure to run.
`next_date`	Next date when the job will be run.
`interval`	Date function that calculates the next time to run the job. The default is `NULL`. This must evaluate to a either a future point in time or `NULL`.
`no_parse`	A flag. The default is `FALSE`. If this is set to `FALSE`, then Oracle parses the procedure associated with the job. If this is set to `TRUE`, then Oracle parses the procedure associated with the job the first time that the job is run. For example, if you want to submit a job before you have created the tables associated with the job, then set this to `TRUE`.
`instance`	When a job is submitted, specifies which instance can run the job.
`force`	If this is `TRUE`, then any positive integer is acceptable as the job instance. If this is `FALSE` (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
```

```
   DBMS_JOB.SUBMIT(:jobno,
      'dbms_ddl.analyze_object(''TABLE'',
      ''DQUON'', ''ACCOUNTS'',
      ''ESTIMATE'', NULL, 50);'
      SYSDATE, 'SYSDATE + 1');
   COMMIT;
END;
/
Statement processed.
print jobno
JOBNO
----------
14144
```

USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (8*i* and after) and preserves the compatibility.

Syntax

```
DBMS_JOB.USER_EXPORT (
   job    IN     BINARY_INTEGER,
   mycall IN OUT VARCHAR2);

DBMS_JOB.USER_EXPORT (
   job      IN     BINARY_INTEGER,
   mycall   IN OUT VARCHAR2,
   myinst   IN OUT VARCHAR2);
```

Parameters

Table 48–10 USER_EXPORT Procedure Parameter

Parameter	Description
`job`	Number of the job being run.
`mycall`	Text of a call to re-create the given job.
`myinst`	Text of a call to alter instance affinity.

WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```
DBMS_JOB.WHAT (
   job       IN  BINARY_INTEGER,
   what      IN  VARCHAR2);
```

Parameters

Table 48–11 WHAT Procedure Parameters

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.

Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- Some legal values of what (assuming the routines exist) are:
  - 'myproc(''10-JAN-82'', next_date, broken);'
  - 'scott.emppackage.give_raise(''JENKINS'', 30000.00);'
  - 'dbms_job.remove(job);'

49

DBMS_LDAP

The DBMS_LDAP package lets you access data from LDAP servers.

- Documentation of DBMS_LDAP

Documentation of DBMS_LDAP

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP` in the *Oracle Internet Directory Application Developer's Guide.*

50

DBMS_LDAP_UTL

The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

- Documentation of DBMS_LDAP_UTL

Documentation of DBMS_LDAP_UTL

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP_UTL` in the *Oracle Internet Directory Application Developer's Guide.*

51

DBMS_LIBCACHE

The DBMS_LIBCACHE package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

Using DBMS_LIBCACHE

Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements. The open and parse functions are executed in advance for PL/SQL and DML. For PL/SQL, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

Security Model

To execute DBMS_LIBCACHE you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, DBMS_LIBCACHE should be called for each.

Alternatively, DBMS_LIBCACHE may be called with the generic user PARSER. However, this user cannot parse the SQL that uses objects with access granted though roles. This is a standard PL/SQL security limitation.

Summary of DBMS_LIBCACHE Subprograms

Table 51–1 DBMS_LIBCACHE Package Subprograms

Subprogram	Description
COMPILE_FROM_REMOTE Procedure on page 51-6	Extracts SQL in batch from the source instance and compiles the SQL at the target instance

COMPILE_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
   p_db_link                IN     dbms_libcache$def.db_link%type,
   p_username               IN     VARCHAR2 default null,
   p_threshold_executions   IN     NATURAL  default 3,
   p_threshold_sharable_mem IN     NATURAL  default 1000,
   p_parallel_degree        IN     NATURAL  default 1);
```

Parameters

Table 51–2 COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
p_db_link	Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role SELECT_ON_CATALOG at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with dbms_libcache$def.ACCESS_METHOD = DB_LINK_METHOD
p_instance_name	(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.
p_username	Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single user_id, for example APPS, APPS is the parsing user_id that is recorded in the shared pool. To select only SQL statements parsed by APPS, enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example GL. If the username is supplied, it must be valid. The name is not case sensitive.
p_threshold_executions	The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

Table 51–2 (Cont.) COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
p_threshold_sharable_mem	The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.
p_parallel_degree	The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.

52

DBMS_LOB

The DBMS_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS_LOB to access and manipulation specific parts of a LOB or complete LOBs.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects*

This chapter contains the following topics:

Using DBMS_LOB

Overview

DBMS_LOB can read and modify BLOBs, CLOBs, and NCLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

Security Model

This package must be created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS_LOB subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_LOB subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the AUTHID to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE proc1 authid definer ...
```

or

```
CREATE PROCEDURE proc1 authid current_user ...
```

> **See Also:** For more information on AUTHID and privileges, see *Oracle Database PL/SQL User's Guide and Reference*

You can provide secure access to BFILEs using the DIRECTORY feature discussed in BFILENAME function in the *Oracle Database Application Developer's Guide - Large Objects* and the *Oracle Database SQL Reference*.

For information about the security model pertaining to temporary LOBs, see Operational Notes.

Constants

DBMS_LOB defines the following constants:

```
file_readonly CONSTANT BINARY_INTEGER := 0;
lob_readonly  CONSTANT BINARY_INTEGER := 0;
lob_readwrite CONSTANT BINARY_INTEGER := 1;
lobmaxsize    CONSTANT INTEGER        := 18446744073709551615;
call          CONSTANT PLS_INTEGER    := 12;
session       CONSTANT PLS_INTEGER    := 10;
```

Datatypes

The DBMS_LOB package uses the datatypes shown in Table 52–1.

Table 52–1 Datatypes Used by DBMS_LOB

Type	Description
BLOB	Source or destination binary LOB.
RAW	Source or destination RAW buffer (used with BLOB).
CLOB	Source or destination character LOB (including NCLOB).
VARCHAR2	Source or destination character buffer (used with CLOB and NCLOB).
INTEGER	Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.
BFILE	Large, binary object stored outside the database.

The DBMS_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause ANY_CS in the specification of DBMS_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

Rules and Limits

General Rules and Limits

- The following rules apply in the specification of subprograms in this package:
  - `length`, `offset`, and `amount` parameters for subprograms operating on `BLOB`s and `BFILE`s must be specified in terms of *bytes*.
  - `length`, `offset`, and `amount` parameters for subprograms operating on `CLOB`s must be specified in terms of *characters*.
- A subprogram raises an `INVALID_ARGVAL` exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
  1. Only positive, absolute offsets from the beginning of `LOB` data are permitted: Negative offsets from the tail of the `LOB` are not permitted.
  2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as `amount`, `offset`, `newlen`, `nth`, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
  3. The value of `offset`, `amount`, `newlen`, `nth` must not exceed the value `lobmaxsize` (4GB-1) in any `DBMS_LOB` subprogram.
  4. For `CLOB`s consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed (`lobmaxsize/character_width_in_bytes`) characters .

     For example, if the `CLOB` consists of 2-byte characters, such as:

     ```
     JA16SJISFIXED
     ```

     Then, the maximum `amount` value should not exceed:

     ```
     4294967295/2 = 2147483647 characters.
     ```
- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for `RAW` and `VARCHAR2` parameters used in `DBMS_LOB` subprograms. For example, if you declare a variable to be:

  ```
  charbuf VARCHAR2(3000)
  ```

  Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for `DBMS_LOB` subprograms for `CLOB`s and `NCLOB`s.
- The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

  For example, in `DBMS_LOB` subprograms that take a `VARCHAR2` buffer parameter, the form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. If the input `LOB` parameter is of type `NCLOB`, then the buffer must contain `NCHAR`

data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

- If the value of amount plus the offset exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

  Under these input conditions, read subprograms, such as READ, COMPARE, INSTR, and SUBSTR, read until End of Lob/File is reached. For example, for a READ operation on a BLOB or BFILE, if the user specifies offset value of 3 GB and an amount value of 2 GB, then READ reads only ((4GB-1)-3GB) bytes.

- Functions with NULL or invalid input values for parameters return a NULL. Procedures with NULL values for destination LOB parameters raise exceptions.
- Operations involving patterns as parameters, such as COMPARE, INSTR, and SUBSTR do not support regular expressions or special matching characters (such as % in the LIKE operator in SQL) in the pattern parameter or substrings.
- The End Of LOB condition is indicated by the READ procedure using a NO_DATA_FOUND exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The READ buffer for the last read contains 0 bytes.
- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.
- Unless otherwise stated, the default value for an offset parameter is 1, which indicates the first byte in the BLOB or BFILE data, and the first character in the CLOB or NCLOB value. No default values are specified for the amount parameter — you must input the values explicitly.
- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as APPEND, COPY, ERASE, TRIM, or WRITE. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILEs)

- The subprograms COMPARE, INSTR, READ, SUBSTR, FILECLOSE, FILECLOSEALL and LOADFROMFILE operate only on an *opened* BFILE locator; that is, a successful FILEOPEN call must precede a call to any of these subprograms.
- For the functions FILEEXISTS, FILEGETNAME and GETLENGTH, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the DIRECTORY object and the file.
- DBMS_LOB does not support any concurrency control mechanism for BFILE operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the FILECLOSEALL subprogram to close all files opened in the session and resume file operations from the beginning.
- If you are the creator of a DIRECTORY, or if you have system privileges, then use the CREATE OR REPLACE, DROP, and REVOKE statements in SQL with extreme caution.

  If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to

invoke a program or anonymous block that calls FILECLOSEALL, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the BFILE.

  In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than SESSION_MAX_OPEN_FILES.

  In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the BFILE variable in its most current state.

  After the exception transfers program control outside the PL/SQL program block, all references to the open BFILEs are lost. The result is a larger open file count which may or may not exceed the SESSION_MAX_OPEN_FILES value.

  For example, consider a READ operation past the end of the BFILE value, which generates a NO_DATA_FOUND exception:

```
DECLARE
       fil BFILE;
       pos INTEGER;
       amt BINARY_INTEGER;
       buf RAW(40);
BEGIN
       SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
       dbms_lob.open(fil, dbms_lob.lob_readonly);
       amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
       dbms_lob.read(fil, amt, pos, buf);
       dbms_output.put_line('Read F1 past EOF: '||
           utl_raw.cast_to_varchar2(buf));
       dbms_lob.close(fil);
END;

ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

  After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
     fil BFILE;
     pos INTEGER;
     amt BINARY_INTEGER;
     buf RAW(40);
BEGIN
     SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
     dbms_lob.open(fil, dbms_lob.lob_readonly);
     amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
     dbms_lob.read(fil, amt, pos, buf);
     dbms_output.put_line('Read F1 past EOF: '||
          utl_raw.cast_to_varchar2(buf));
     dbms_lob.close(fil);
     exception
     WHEN no_data_found
```

```
      THEN
        BEGIN
          dbms_output.put_line('End of File reached. Closing file');
          dbms_lob.fileclose(fil);
          -- or dbms_lob.filecloseall if appropriate
        END;
END;
      /

Statement processed.
End of File reached. Closing file
```

In general, you should ensure that files opened in a PL/SQL block using DBMS_LOB are closed before normal or abnormal termination of the block.

Maximum LOB Size

The maximum size of a LOB supported by the database is equal to the value of the db_block_size initialization parameter times the value 4294967295. This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

Maximum Buffer Size

The maximum buffer size, 32767 bytes, is represented by maxbufsize.

Operational Notes

All DBMS_LOB subprograms work based on LOB locators. For the successful completion of DBMS_LOB subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system. See also Chapter 1 of *Oracle Database Application Developer's Guide - Large Objects.*

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- Internal LOBs
- External LOBs
- Temporary LOBs

Internal LOBs

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

External LOBs

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a DIRECTORY object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the DIRECTORY object and the filename of the external LOB you are adding to the BFILENAME function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the given LOB locator.

After the LOBs are defined and created, you can then SELECT from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to DBMS_LOB for access to the LOB value.

For details on the different ways to do this, you must refer to the section of the *Oracle Database Application Developer's Guide - Large Objects* that describes "Accessing External LOBs (BFILEs)."

Temporary LOBs

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either BLOBs, CLOBs, or NCLOBs.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as CACHE/ NOCACHE. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and rollbacks are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL DBMS_LOB package, PRO*C, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the EMPTY_BLOB or EMPTY_CLOB functions that are supported for permanent LOBs. The EMPTY_BLOB function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the DBMS_LOB package by using the appropriate FREETEMPORARY or OCIDurationEnd statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and DBMS_LOB statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or DBMS_LOB COPY command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a v$ view called V$TEMPORARY_LOBS, which contains information about how many temporary LOBs exist for each session. V$ views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using V$TEMPORARY_LOBS in conjunction with DBA_SEGMENTS, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in DBMS_LOB return NULL if any of the input parameters are NULL. All procedures in DBMS_LOB raise an exception if the LOB locator is input as NULL.
2. Operations based on CLOBs do not verify if the character set IDs of the parameters (CLOB parameters, VARCHAR2 buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.
4. Temporary LOBs still adhere to value semantics in order to be consistent with permanent LOBs and to try to conform to the ANSI standard for LOBs. As a result, each time a user does an OCILobLocatatorAssign, or the equivalent assignment in PL/SQL, the database makes a copy of the temporary LOB.

   Each locator points to its own LOB value. If one locator is used to create a temporary LOB, and then is assigned to another LOB locator using OCILobLOcatorAssign in OCI or through an assignment operation in PL/SQL, then the database copies the original temporary LOB and causes the second locator to point to the copy.

   In order for users to modify the same LOB, they must go through the same locator. In OCI, this can be accomplished fairly easily by using pointers to locators and assigning the pointers to point to the same locator. In PL/SQL, the same LOB variable must be used to update the LOB to get this effect.

   The following example shows a place where a user incurs a copy, or at least an extra round-trip to the server.

```
DECLARE
  a blob;
  b blob;
BEGIN
  dbms_lob.createtemporary(b, TRUE);
  -- the following assignment results in a deep copy
  a := b;
END;
```

   The PL/SQL compiler makes temporary copies of actual arguments bound to OUT or IN OUT parameters. If the actual parameter is a temporary LOB, then the temporary copy is a deep (value) copy.

   The following PL/SQL block illustrates the case where the user incurs a deep copy by passing a temporary LOB as an IN OUT parameter.

```
DECLARE
  a blob;
  procedure foo(parm IN OUT blob) is
  BEGIN
   ...
  END;
```

```
BEGIN
  dbms_lob.createtemporary(a, TRUE);
  -- the following call results in a deep copy of the blob a
  foo(a);
END;
```

To minimize deep copies on PL/SQL parameter passing, use the `NOCOPY` compiler hint where possible.

The duration parameter passed to `dbms_lob.createtemporary()` is a hint. The duration of the new temp `LOB` is the same as the duration of the locator variable in PL/SQL. For example, in the preceding program block, the program variable `a` has the duration of the residing frame. Therefore at the end of the block, memory of `a` will be freed at the end of the function.

If a PL/SQL package variable is used to create a temp `LOB`, it will have the duration of the package variable, which has a duration of `SESSION`.

```
BEGIN
   y clob;
  END;
/
BEGIN
   dbms_lob.createtemporary(package.y, TRUE);
END;
```

See Also: *Oracle Database PL/SQL User's Guide and Reference* for more information on `NOCOPY` syntax

Exceptions

Table 52–2 DBMS_LOB Exceptions

Exception	Code	Description
INVALID_ARGVAL	21560	The argument is expecting a nonNULL, valid value but the argument value passed in is NULL, invalid, or out of range.
ACCESS_ERROR	22925	You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes.
NOEXIST_ DIRECTORY	22285	The directory leading to the file does not exist.
NOPRIV_ DIRECTORY	22286	The user does not have the necessary access privileges on the directory or the file for the operation.
INVALID_ DIRECTORY	22287	The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access.
OPERATION_ FAILED	22288	The operation attempted on the file failed.
UNOPENED_FILE	22289	The file is not open for the required operation to be performed.
OPEN_TOOMANY	22290	The number of open files has reached the maximum limit.
NO_DATA_FOUND		EndofLob indicator for looping read operations. This is not a hard error.
VALUE_ERROR	6502	PL/SQL error for invalid values to subprogram's parameters.

Summary of DBMS_LOB Subprograms

Table 52–3 DBMS_LOB Package Subprograms

Subprogram	Description
APPEND Procedures on page 52-18	Appends the contents of the source LOB to the destination LOB
CLOSE Procedure on page 52-19	Closes a previously opened internal or external LOB
COMPARE Functions on page 52-20	Compares two entire LOBs or parts of two LOBs
CONVERTTOBLOB Procedure on page 52-22	Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets
CONVERTTOCLOB Procedure on page 52-25	Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets
COPY Procedures on page 52-28	Copies all, or part, of the source LOB to the destination LOB
CREATETEMPORARY Procedures on page 52-30	Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace
ERASE Procedures on page 52-31	Erases all or part of a LOB
FILECLOSE Procedure on page 52-33	Closes the file
FILECLOSEALL Procedure on page 52-34	Closes all previously opened files
FILEEXISTS Function on page 52-35	Checks if the file exists on the server
FILEGETNAME Procedure on page 52-36	Gets the directory object name and file name
FILEISOPEN Function on page 52-37	Checks if the file was opened using the input BFILE locators
FILEOPEN Procedure on page 52-38	Opens a file
FREETEMPORARY Procedures on page 52-39	Frees the temporary BLOB or CLOB in the user's default temporary tablespace
GETCHUNKSIZE Functions on page 52-41	Returns the amount of space used in the LOB chunk to store the LOB value
GETLENGTH Functions on page 52-42	Gets the length of the LOB value
GET_STORAGE_LIMIT on page 52-40	Returns the storage limit for LOBs in your database configuration
INSTR Functions on page 52-43	Returns the matching position of the *nth* occurrence of the pattern in the LOB
ISOPEN Functions on page 52-45	Checks to see if the LOB was already opened using the input locator

Table 52–3 (Cont.) DBMS_LOB Package Subprograms

Subprogram	Description
ISTEMPORARY Functions on page 52-46	Checks if the locator is pointing to a temporary `LOB`
LOADBLOBFROMFILE Procedure on page 52-47	Loads `BFILE` data into an internal `BLOB`
LOADCLOBFROMFILE Procedure on page 52-49	Loads `BFILE` data into an internal `CLOB`
LOADFROMFILE Procedure on page 52-52	Loads `BFILE` data into an internal `LOB`
OPEN Procedures on page 52-54	Opens a `LOB` (internal, external, or temporary) in the indicated mode
READ Procedures on page 52-56	Reads data from the `LOB` starting at the specified offset
SUBSTR Functions on page 52-58	Returns part of the `LOB` value starting at the specified offset
TRIM Procedures on page 52-60	Trims the `LOB` value to the specified shorter length
WRITE Procedures on page 52-62	Writes data to the `LOB` from a specified offset
WRITEAPPEND Procedures on page 52-64	Writes a buffer to the end of a `LOB`

APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

There are two overloaded APPEND procedures.

Syntax

```
DBMS_LOB.APPEND (
   dest_lob IN OUT  NOCOPY BLOB,
   src_lob  IN             BLOB);

DBMS_LOB.APPEND (
   dest_lob IN OUT  NOCOPY CLOB  CHARACTER SET ANY_CS,
   src_lob  IN             CLOB  CHARACTER SET dest_lob%CHARSET);
```

Parameters

Table 52–4 APPEND Procedure Parameters

Parameter	Description
dest_lob	Locator for the internal LOB to which the data is to be appended.
src_lob	Locator for the internal LOB from which the data is to be read.

Exceptions

Table 52–5 APPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Either the source or the destination LOB is NULL.

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

```
DBMS_LOB.CLOSE (
   lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
   lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
   file_loc   IN OUT NOCOPY BFILE);
```

Parameters

Table 52–6 CLOSE Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILEs), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close APIs. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

Syntax

```
DBMS_LOB.COMPARE (
   lob_1            IN BLOB,
   lob_2            IN BLOB,
   amount           IN INTEGER := 4294967295,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.COMPARE (
   lob_1            IN CLOB  CHARACTER SET ANY_CS,
   lob_2            IN CLOB  CHARACTER SET lob_1%CHARSET,
   amount           IN INTEGER := 4294967295,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.COMPARE (
   lob_1            IN BFILE,
   lob_2            IN BFILE,
   amount           IN INTEGER,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–7 COMPARE Function Parameters

Parameter	Description
lob_1	LOB locator of first target for comparison.
lob_2	LOB locator of second target for comparison.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to compare.
offset_1	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.
offset_2	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.

Return Values

- INTEGER: Zero if the comparison succeeds, nonzero if not.
- NULL, if
  - amount < 1
  - amount > LOBMAXSIZE
  - offset_1 or offset_2 < 1

* offset_1 or offset_2 > LOBMAXSIZE

Usage Notes

You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

COMPARE returns zero if the data exactly matches over the range specified by the offset and amount parameters. Otherwise, a nonzero INTEGER is returned.

For fixed-width *n*-byte CLOBs, if the input amount for COMPARE is specified to be greater than (4294967295/*n*), then COMPARE matches characters in a range of size (4294967295/*n*), or Max(length(clob1), length(clob2)), whichever is lesser.

Exceptions

Table 52–8 COMPARE Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_ DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_ DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_ OPERATION	File does not exist, or you do not have access privileges on the file.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOBLOB(
  dest_lob       IN OUT     NOCOPY  BLOB,
  src_clob       IN         CLOB CHARACTER SET ANY_CS,
  amount         IN         INTEGER,
  dest_offset    IN OUT     INTEGER,
  src_offset     IN OUT     INTEGER,
  blob_csid      IN         NUMBER,
  lang_context   IN OUT     INTEGER,
  warning        OUT        INTEGER);
```

Parameters

Table 52–9 CONVERTTOBLOB Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number ofcharacters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB.
dest_offset	(IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write.
src_offset	(IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 52–9 (Cont.) CONVERTTOBLOB Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.

Usage Notes

Preconditions

Before calling the CONVERTTOBLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 52–10 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.

Table 52–10 DBMS_LOB.CONVERTTOBLOB Typical Values

Parameter	Value	Description
amount	LOBMAXSIZE (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	DEFAULT_CSID (IN)	default CSID, use same CSID as source LOB
lang_context	DEFAULT_LANG_CTX (IN)	default language context
warning	NO_WARNING (OUT)	no warning message, success
	WARN_INCONVERTIBLE_CHAR (OUT)	character in source cannot be properly converted

General Notes

You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the desired character set is the same as the source LOB character set, and performs a binary copy of the data—no character set conversion is performed.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source `LOB`. The `amount` and `src_offset` values are in characters and the `dest_offset` is in bytes. To convert the entire `LOB`, you can specify `LOBMAXSIZE` for the `amount` parameter.

Exceptions

Table 52–11 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

Table 52–11 CONVERTTOBLOB Procedure Exceptions

Exception	Description
`VALUE_ERROR`	Any of the input parameters are `NULL` or `INVALID`.
`INVALID_ARGVAL`	One or more of the following: - `src_offset` or `dest_offset` < 1. - `src_offset` or `dest_offset` > `LOBMAXSIZE`. - `amount` < 1. - `amount` > `LOBMAXSIZE`.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for more information on using LOBs in application development

CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOCLOB(
   dest_lob       IN OUT NOCOPY  CLOB CHARACTER SET ANY_CS,
   src_blob       IN             BLOB,
   amount         IN             INTEGER,
   dest_offset    IN OUT         INTEGER,
   src_offset     IN OUT         INTEGER,
   blob_csid      IN             NUMBER,
   lang_context   IN OUT         INTEGER,
   warning        OUT            INTEGER);
```

Parameters

Table 52–12 CONVERTTOCLOB Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of bytes to convert from the source LOB. If you want to copy the entire BLOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the BLOB.
dest_offset	(IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write.
src_offset	(IN) Offset in bytes in the source LOB for the start of the read. (OUT) Offset in bytes in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 52–12 (Cont.) CONVERTTOCLOB Procedure Parameters

Parameter	Description
warning	Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.

Usage Notes

Preconditions

Before calling the CONVERTTOCLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the CONVERTTOCLOB procedure. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 52–13 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.

Table 52–13 DBMS_LOB.CONVERTTOCLOB Typical Values

Parameter	Value	Description
amount	LOBMAXSIZE (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	DEFAULT_CSID (IN)	default CSID, use destination CSID
lang_context	DEFAULT_LANG_CTX (IN)	default language context
warning	NO_WARNING (OUT)	no warning message, success
	WARN_INCONVERTIBLE_CHAR (OUT)	character in source cannot be properly converted

General Notes

You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the BLOB contains character data in the same character set as the destination CLOB, and performs a binary copy of the data to the destination LOB, no character set conversion being performed.

You must specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BLOB. The amount and src_offset values are in bytes and the dest_offset is in characters. To convert the entire BLOB, you can specify LOBMAXSIZE for the amount parameter.

Exceptions

Table 52–14 CONVERTTOCLOB Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for more information on using LOBs in application development

COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

Syntax

```
DBMS_LOB.COPY (
  dest_lob    IN OUT NOCOPY BLOB,
  src_lob     IN            BLOB,
  amount      IN            INTEGER,
  dest_offset IN            INTEGER := 1,
  src_offset  IN            INTEGER := 1);

DBMS_LOB.COPY (
  dest_lob    IN OUT NOCOPY CLOB  CHARACTER SET ANY_CS,
  src_lob     IN            CLOB  CHARACTER SET dest_lob%CHARSET,
  amount      IN            INTEGER,
  dest_offset IN            INTEGER := 1,
  src_offset  IN            INTEGER := 1);
```

Parameters

Table 52–15 COPY Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the copy target.
src_lob	LOB locator of source for the copy.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to copy.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.
src_offset	Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.

Exceptions

Table 52–16 COPY Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or invalid.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1 - src_offset or dest_offset > LOBMAXSIZE - amount < 1 - amount > LOBMAXSIZE

Usage Notes

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the src_offset to the end of the source LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (
   lob_loc IN OUT NOCOPY BLOB,
   cache   IN            BOOLEAN,
   dur     IN            PLS_INTEGER := 10);

DBMS_LOB.CREATETEMPORARY (
   lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   cache   IN            BOOLEAN,
   dur     IN            PLS_INTEGER := 10);
```

Parameters

Table 52–17 CREATETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
cache	Specifies if LOB should be read into buffer cache or not.
dur	1 of 2 predefined duration values (SESSION or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session or call. If dur is omitted, then the session duration is used.

See Also:

- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure
- *Oracle Database PL/SQL User's Guide and Reference* for more information about NOCOPY and passing temporary lobs as parameters

ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

Syntax

```
DBMS_LOB.ERASE (
   lob_loc           IN OUT   NOCOPY   BLOB,
   amount            IN OUT   NOCOPY   INTEGER,
   offset            IN                INTEGER := 1);

DBMS_LOB.ERASE (
   lob_loc           IN OUT   NOCOPY   CLOB CHARACTER SET ANY_CS,
   amount            IN OUT   NOCOPY   INTEGER,
   offset            IN                INTEGER := 1);
```

Parameters

Table 52–18 ERASE Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be erased.For more information, see Operational Notes.
amount	Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.
offset	Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).

Usage Notes

Note: The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "TRIM Procedures" on page 52-60.

When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.

The actual number of bytes or characters erased can differ from the number you specified in the amount parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.

Exceptions

Table 52–19 ERASE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any input parameter is NULL.
INVALID_ARGVAL	Either: - amount < 1 or amount > LOBMAXSIZE - offset < 1 or offset > LOBMAXSIZE

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "TRIM Procedures" on page 52-60
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

> **Note:** The database has only read-only access to BFILEs. This means that BFILEs cannot be written through the database.

Syntax

```
DBMS_LOB.FILECLOSE (
    file_loc IN OUT NOCOPY BFILE);
```

Parameters

Table 52–20 FILECLOSE Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE to be closed.

Exceptions

Table 52–21 FILECLOSE Procedure Exceptions

Exception	Description
VALUE_ERROR	NULL input value for file_loc.
UNOPENED_FILE	File was not opened with the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- "FILEOPEN Procedure" on page 52-38
- "FILECLOSEALL Procedure" on page 52-34
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILECLOSEALL Procedure

This procedure closes all BFILEs opened in the session.

Syntax

```
DBMS_LOB.FILECLOSEALL;
```

Exceptions

Table 52–22 FILECLOSEALL Procedure Exception

Exception	Description
UNOPENED_FILE	No file has been opened in the session.

See Also:

- "FILEOPEN Procedure" on page 52-38
- "FILECLOSE Procedure" on page 52-33
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEEXISTS Function

This function finds out if a given BFILE locator points to a file that actually exists on the server's file system.

Syntax

```
DBMS_LOB.FILEEXISTS (
   file_loc     IN    BFILE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–23 FILEEXISTS Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

Table 52–24 FILEEXISTS Function Return Values

Return	Description
0	Physical file does not exist.
1	Physical file exists.

Exceptions

Table 52–25 FILEEXISTS Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- "FILEISOPEN Function" on page 52-37.
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator. This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the dir_alias buffer is 30, and for the entire path name, it is 2000.

Syntax

```
DBMS_LOB.FILEGETNAME (
   file_loc   IN    BFILE,
   dir_alias  OUT   VARCHAR2,
   filename   OUT   VARCHAR2);
```

Parameters

Table 52–26 FILEGETNAME Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE
dir_alias	Directory object name
filename	Name of the BFILE

Exceptions

Table 52–27 FILEGETNAME Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	dir_alias or filename are NULL.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEISOPEN Function

This function finds out whether a BFILE was opened with the given FILE locator.

Syntax

```
DBMS_LOB.FILEISOPEN (
   file_loc   IN    BFILE)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–28 FILEISOPEN Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

INTEGER: 0 = file is not open, 1 = file is open

Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

Exceptions

Table 52–29 FILEISOPEN Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- "FILEEXISTS Function" on page 52-35
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

Syntax

```
DBMS_LOB.FILEOPEN (
   file_loc   IN OUT NOCOPY  BFILE,
   open_mode  IN             BINARY_INTEGER := file_readonly);
```

Parameters

Table 52–30 FILEOPEN Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE.
open_mode	File access is read-only.

Exceptions

Table 52–31 FILEOPEN Procedure Exceptions

Exception	Description
VALUE_ERROR	file_loc or open_mode is NULL.
INVALID_ARGVAL	open_mode is not equal to FILE_READONLY.
OPEN_TOOMANY	Number of open files in the session exceeds session_max_open_files.
NOEXIST_DIRECTORY	Directory associated with file_loc does not exist.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- "FILECLOSE Procedure" on page 52-33
- "FILECLOSEALL Procedure" on page 52-34
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in your default temporary tablespace.

Syntax

```
DBMS_LOB.FREETEMPORARY (
   lob_loc  IN OUT  NOCOPY BLOB);

DBMS_LOB.FREETEMPORARY (
   lob_loc  IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 52–32 FREETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator.For more information, see Operational Notes.

Usage Notes

After the call to FREETEMPORARY, the LOB locator that was freed is marked as invalid.

If an invalid LOB locator is assigned to another LOB locator using OCILobLocatorAssign in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

GET_STORAGE_LIMIT

The DBMS_LOB.GET_STORAGE_LIMIT function returns the LOB storage limit for your database configuration. The DBMS_LOB package supports LOB instances up to this storage limit in size.

Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT
  RETURN INTEGER;
```

Return Value

The value returned from this function is the maximum allowable size for LOB instances for your database configuration. The return value depends on your DB_BLOCK_SIZE initialization parameter setting and is calculated as (4 gigabytes minus 1) times the value of the DB_BLOCK_SIZE initialization parameter.

Usage

Note that BLOB instances are sized in bytes while CLOB and NCLOB instances are sized in characters.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for details on LOB storage limits

GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, which can be a multiple of database blocks. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value.

This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

```
DBMS_LOB.GETCHUNKSIZE (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksize, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–33 GETCHUNKSIZE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Return Values

The value returned for BLOBs is in terms of bytes. The value returned for CLOBs is in terms of characters.

Usage Notes

Performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the WRITE until you have enough for a chunk, instead of issuing several WRITE calls for the same chunk.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```
DBMS_LOB.GETLENGTH (
   lob_loc    IN  BLOB)
  RETURN INTEGER;

DBMS_LOB.GETLENGTH (
   lob_loc    IN  CLOB   CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.GETLENGTH (
   file_loc    IN  BFILE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–34 GETLENGTH Function Parameter

Parameter	Description
file_loc	The file locator for the LOB whose length is to be returned.

Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob_loc is NULL. An error is returned in the following cases for BFILEs:

- lob_loc does not have the necessary directory and operating system privileges
- lob_loc cannot be read because of an operating system read error

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

INSTR Functions

This function returns the matching position of the *nth* occurrence of the pattern in the LOB, starting from the offset you specify.

Syntax

```
DBMS_LOB.INSTR (
   lob_loc    IN   BLOB,
   pattern    IN   RAW,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.INSTR (
   lob_loc    IN   CLOB      CHARACTER SET ANY_CS,
   pattern    IN   VARCHAR2  CHARACTER SET lob_loc%CHARSET,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.INSTR (
   file_loc   IN   BFILE,
   pattern    IN   RAW,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–35 INSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
pattern	Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs.The maximum size of the pattern is 16383 bytes.
offset	Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)
nth	Occurrence number, starting at 1.

Return Values

Table 52–36 INSTR Function Return Values

Return	Description
INTEGER	Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.

Table 52–36 (Cont.) INSTR Function Return Values

Return	Description
NULL	Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE.

Usage Notes

The form of the VARCHAR2 buffer (the pattern parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

Exceptions

Table 52–37 INSTR Function Exceptions for BFILES

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_ DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_ DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_ OPERATION	File does not exist, or you do not have access privileges on the file.

- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

Syntax

```
DBMS_LOB.ISOPEN (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
   file_loc IN BFILE)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–38 ISOPEN Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
file_loc	File locator.

Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (BFILEs), ISOPEN also requires a round-trip, because that's where the state is kept.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

Syntax

```
DBMS_LOB.ISTEMPORARY (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 52–39 ISTEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Return Values

This function returns TRUE in temporary if the locator is pointing to a temporary LOB. It returns FALSE otherwise.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
   dest_lob    IN OUT NOCOPY BLOB,
   src_bfile   IN            BFILE,
   amount      IN            INTEGER,
   dest_offset IN OUT        INTEGER,
   src_offset  IN OUT        INTEGER);
```

Parameters

Table 52–40 LOADBLOBFROMFILE Procedure Parameters

Parameter	Descriptionw
dest_lob	BLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in bytes for BLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect

performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

Table 52–41 Suggested Values of the Parameter

Parameter	Default Value	Description
amount	DBMSLOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Constants defined in DBMSLOB.SQL

```
lobmaxsize                    CONSTANT INTEGER        := 4294967295;
```

Exceptions

Table 52–42 LOADBLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
   dest_lob       IN OUT NOCOPY   BLOB,
   src_bfile      IN              BFILE,
   amount         IN              INTEGER,
   dest_offset    IN OUT          INTEGER,
   src_offset     IN OUT          INTEGER,
   bfile_csid     IN              NUMBER,
   lang_context   IN OUT          INTEGER,
   warning        OUT             INTEGER);
```

Parameters

Table 52–43 LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
dest_lob	CLOB/NCLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. Use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.
bfile_csid	Character set id of the source (BFILE) file.
lang_context	(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call

Table 52–43 (Cont.) LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined as warn_inconvertible_char in DBMSLOB.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
- csid=0 indicates the default behavior that uses database csid for CLOB and national csid for NCLOB in the place of source csid. Conversion is still necessary if it is of varying width
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

  If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Constants

Here is a summary of the constants and the suggested values that can be used.

Table 52–44 Suggested Values of the Parameter

Parameter	Suggested Value	Description
amount	DBMSLOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Table 52–44 (Cont.) Suggested Values of the Parameter

Parameter	Suggested Value	Description
csid	0 (IN)	default csid, use destination csid
lang_context	0 (IN)	default language context
warning	0 (OUT)	no warning message, everything is ok

Constants defined in DBMSLOB.SQL

```
lobmaxsize                  CONSTANT INTEGER       := 18446744073709551615;
warn_inconvertible_char     CONSTANT INTEGER       := 1;
default_csid                CONSTANT INTEGER       := 0;
default_lang_ctx            CONSTANT INTEGER       := 0;
no_warning                  CONSTANT INTEGER       := 0;
```

Exceptions

Table 52–45 LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

LOADFROMFILE Procedure

This procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

Syntax

```
DBMS_LOB.LOADFROMFILE (
   dest_lob    IN OUT NOCOPY BLOB,
   src_file    IN            BFILE,
   amount      IN            INTEGER,
   dest_offset IN            INTEGER  := 1,
   src_offset  IN            INTEGER  := 1);
```

Parameters

Table 52–46 LOADFROMFILE Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the target for the load.
src_file	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.
src_offset	Offset in bytes in the source BFILE (origin: 1) for the start of the load.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is either in bytes or characters for BLOBs and CLOBs respectively.

> **Note:** The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

Note: If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using DBMS_LOB.LOADFROMFILE, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use sql*loader instead of LOADFROMFILE to load data into a CLOB or NCLOB because sql*loader will provide the necessary character set conversions.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Exceptions

Table 52–47 LOADFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

```
DBMS_LOB.OPEN (
   lob_loc   IN OUT NOCOPY BLOB,
   open_mode IN            BINARY_INTEGER);

DBMS_LOB.OPEN (
   lob_loc   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   open_mode IN            BINARY_INTEGER);

DBMS_LOB.OPEN (
   file_loc  IN OUT NOCOPY BFILE,
   open_mode IN            BINARY_INTEGER := file_readonly);
```

Parameters

Table 52–48 OPEN Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
open_mode	Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.

Usage Notes

Note: If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILEs), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close APIs. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and nonLOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input offset points past the End of LOB, then amount is set to 0, and a NO_DATA_FOUND exception is raised.

Syntax

```
DBMS_LOB.READ (
   lob_loc   IN             BLOB,
   amount    IN OUT  NOCOPY BINARY_INTEGER,
   offset    IN             INTEGER,
   buffer    OUT            RAW);

DBMS_LOB.READ (
   lob_loc   IN             CLOB CHARACTER SET ANY_CS,
   amount    IN OUT  NOCOPY BINARY_INTEGER,
   offset    IN             INTEGER,
   buffer    OUT            VARCHAR2 CHARACTER SET lob_loc%CHARSET);

DBMS_LOB.READ (
   file_loc   IN              BFILE,
   amount    IN OUT   NOCOPY BINARY_INTEGER,
   offset    IN              INTEGER,
   buffer    OUT             RAW);
```

Parameters

Table 52–49 READ Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).
buffer	Output buffer for the read operation.

Exceptions

Table 52–50 lists exceptions that apply to any LOB instance. Table 52–51 lists exceptions that apply only to BFILEs.

Table 52–50 READ Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL.

Table 52–50 (Cont.) READ Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE - amount is greater, in bytes or characters, than the capacity of buffer.
NO_DATA_FOUND	End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0.

Table 52–51 READ Procedure Exceptions for BFILEs

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_ DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_ DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_ OPERATION	File does not exist, or you do not have access privileges on the file.

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

> **See Also:** *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width n-byte CLOBs, if the input amount for SUBSTR is greater than (32767/n), then SUBSTR returns a character buffer of length (32767/n), or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, n is the maximum byte-width used for characters in the CLOB.

Syntax

```
DBMS_LOB.SUBSTR (
   lob_loc     IN    BLOB,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN RAW;

DBMS_LOB.SUBSTR (
   lob_loc     IN    CLOB   CHARACTER SET ANY_CS,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;

DBMS_LOB.SUBSTR (
   file_loc     IN    BFILE,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 52–52 SUBSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to be read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).

Return Values

Table 52–53 SUBSTR Function Return Values

Return	Description
RAW	Function overloading that has a BLOB or BFILE in parameter.
VARCHAR2	CLOB version.

Table 52–53 (Cont.) SUBSTR Function Return Values

Return	Description
NULL	Either: - any input parameter is NULL - amount < 1 - amount > 32767 - offset < 1 - offset > LOBMAXSIZE

Exceptions

Table 52–54 SUBSTR Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_ DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_ DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_ OPERATION	File does not exist, or you do not have access privileges on the file.

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

- "INSTR Functions" on page 52-43
- "READ Procedures" on page 52-56
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the newlen parameter. Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

> **Note:** The TRIM procedure decreases the length of the LOB to the value specified in the newlen parameter.

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in newlen is greater than the size of the LOB, then an exception is raised.

Syntax

```
DBMS_LOB.TRIM (
   lob_loc         IN OUT  NOCOPY BLOB,
   newlen          IN              INTEGER);

DBMS_LOB.TRIM (
   lob_loc         IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS,
   newlen          IN              INTEGER);
```

Parameters

Table 52–55 RIM Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes.
newlen	New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.

Exceptions

Table 52–56 TRIM Procedure Exceptions

Exception	Description
VALUE_ERROR	lob_loc is NULL.
INVALID_ARGVAL	Either: - new_len < 0 - new_len > LOBMAXSIZE

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "ERASE Procedures" on page 52-31
- "WRITEAPPEND Procedures" on page 52-64
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the buffer parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```
DBMS_LOB.WRITE (
   lob_loc  IN OUT NOCOPY  BLOB,
   amount   IN             BINARY_INTEGER,
   offset   IN             INTEGER,
   buffer   IN             RAW);

DBMS_LOB.WRITE (
   lob_loc  IN OUT  NOCOPY CLOB   CHARACTER SET ANY_CS,
   amount   IN             BINARY_INTEGER,
   offset   IN             INTEGER,
   buffer   IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 52–57 WRITE Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB to be written to. For more information, see Operational Notes.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to write, or number that were written.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.
buffer	Input buffer for the write.

Exceptions

Table 52–58 WRITE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data

currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITE from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "APPEND Procedures" on page 52-18
- "COPY Procedures" on page 52-28
- *Oracle Database Application Developer's Guide - Large Objects* for additional details on usage of this procedure

WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the buffer parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (
   lob_loc IN OUT NOCOPY BLOB,
   amount  IN            BINARY_INTEGER,
   buffer  IN            RAW);

DBMS_LOB.WRITEAPPEND (
   lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount  IN            BINARY_INTEGER,
   buffer  IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 52–59 WRITEAPPEND Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB to be written to. For more information, see Operational Notes.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to write, or number that were written.
buffer	Input buffer for the write.

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

Table 52–60 WRITEAPPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE

Usage Notes

The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

When calling DBMS_LOB.WRITEAPPEND from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set.

The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

It is not mandatory that you wrap the LOB operation inside the Open/Close APIs. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

53

DBMS_LOCK

The DBMS_LOCK package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

> **See Also:** For more information, and an example of how to use the DBMS_LOCK package, see "About User Locks" in *Oracle Database Application Developer's Guide - Fundamentals*

This chapter contains the following topics:

Using DBMS_LOCK

Overview

Some uses of user locks:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

Constants

The DBMS_LOCK package uses the constants shown in Table 53–1.

Table 53–1 DBMS_LOCK Constants

Name	Alternate Name(s)	Type	Value	OEM Abbreviation	Description
NL_MODE	NuL1	INTEGER	1	-	-
SS_MODE	Sub Shared	INTEGER	2	ULRS	This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.
SX_MODE	■ Sub eXclusive ■ Row Exclusive Mode	INTEGER	3	ULRX	This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.
S_MODE	■ Shared ■ Row Exclusive Mode ■ Intended Exclusive	INTEGER	4	ULRSX	-
SSX_MODE	■ Shared Sub eXclusive ■ Share Row Exclusive Mode	INTEGER	5	-	This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.
X_MODE	Exclusive	INTEGER	6	ULX	-

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

Rules and Limits

When another process holds "held", an attempt to get "get" does the following:

Table 53–2 Lock Compatibility

HELD MODE	GET NL	GET SS	GET SX	GET S	GET SSX	GET X
NL	Success	Success	Success	Success	Success	Success
SS	Success	Success	Success	Success	Success	Fail
SX	Success	Success	Success	Fail	Fail	Fail
S	Success	Success	Fail	Success	Fail	Fail
SSX	Success	Success	Fail	Fail	Fail	Fail
X	Success	Fail	Fail	Fail	Fail	Fail

```
maxwait  constant integer := 32767;
```

The constant `maxwait` waits forever.

Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views. User locks are automatically released when a session terminates.The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

`DBMS_LOCK` is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

Summary of DBMS_LOCK Subprograms

Table 53–3 DBMS_LOCK Package Subprograms

Subprogram	Description
ALLOCATE_UNIQUE Procedure on page 53-9	Allocates a unique lock ID to a named lock.
CONVERT Function on page 53-11	Converts a lock from one mode to another.
RELEASE Function on page 53-12	Releases a lock.
REQUEST Function on page 53-13	Requests a lock of a specific mode.
SLEEP Procedure on page 53-14	Puts a procedure to sleep for a specific time.

ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) given a lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
   lockname         IN  VARCHAR2,
   lockhandle       OUT VARCHAR2,
   expiration_secs  IN  INTEGER   DEFAULT 864000);
```

Parameters

Table 53–4 ALLOCATE_UNIQUE Procedure Parameters

Parameter	Description
lockname	Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA$; these are reserved for products supplied by Oracle.
lockhandle	Returns the handle to the lock ID generated by ALLOCATE_UNIQUE. You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE. A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.
expiration_specs	Number of seconds to wait after the last ALLOCATE_UNIQUE has been performed on a given lock, before permitting that lock to be deleted from the DBMS_LOCK_ALLOCATED table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to ALLOCATE_UNIQUE may delete expired locks to recover space.

Usage Notes

If you choose to identify locks by name, you can use ALLOCATE_UNIQUE to generate a unique lock identification number for these named locks.

The first session to call ALLOCATE_UNIQUE with a new lock name causes a unique lock ID to be generated and stored in the dbms_lock_allocated table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least expiration_secs (defaults to 10 days) past the last call to ALLOCATE_UNIQUE with the given lock name. After this time, the row in the dbms_lock_allocated table for this lock name may be deleted in order to recover space. ALLOCATE_UNIQUE performs a commit.

Note: Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a given name.

Exceptions

`ORA-20000,ORU-10003: Unable to find or insert lock <lockname> into catalog dbms_lock_allocated.`

CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.CONVERT(
   id         IN INTEGER ||
   lockhandle IN VARCHAR2,
   lockmode   IN INTEGER,
   timeout    IN NUMBER DEFAULT MAXWAIT)
  RETURN INTEGER;
```

Parameters

Table 53–5 CONVERT Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	New mode that you want to assign to the given lock. For the available modes and their associated integer identifiers, see Constants on page 53-5.
timeout	Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).

Return Values

Table 53–6 CONVERT Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Don't own lock specified by id or lockhandle
5	Illegal lock handle

RELEASE Function

This function explicitly releases a lock previously acquired using the REQUEST function. Locks are automatically released at the end of a session. RELEASE is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.RELEASE (
   id         IN INTEGER)
  RETURN INTEGER;

DBMS_LOCK.RELEASE (
   lockhandle IN VARCHAR2)
  RETURN INTEGER;
```

Parameters

Table 53–7 RELEASE Function Parameter

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.

Return Values

Table 53–8 RELEASE Function Return Values

Return Value	Description
0	Success
3	Parameter error
4	Do not own lock specified by id or lockhandle
5	Illegal lock handle

REQUEST Function

This function requests a lock with a given mode. REQUEST is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.REQUEST(
   id                 IN  INTEGER ||
   lockhandle         IN  VARCHAR2,
   lockmode           IN  INTEGER DEFAULT X_MODE,
   timeout            IN  INTEGER DEFAULT MAXWAIT,
   release_on_commit  IN  BOOLEAN DEFAULT FALSE)
  RETURN INTEGER;
```

The current default values, such as X_MODE and MAXWAIT, are defined in the DBMS_LOCK package specification.

Parameters

Table 53–9 REQUEST Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see Constants on page 53-5.
timeout	Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 (timeout).
release_on_commit	Set this parameter to TRUE to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session.

Return Values

Table 53–10 REQUEST Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Already own lock specified by id or lockhandle
5	Illegal lock handle

SLEEP Procedure

This procedure suspends the session for a given period of time.

Syntax

```
DBMS_LOCK.SLEEP (
   seconds  IN NUMBER);
```

Parameters

Table 53–11 SLEEP Procedure Parameters

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

54

DBMS_LOGMNR

The DBMS_LOGMNR package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

> **See Also:** *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

Using DBMS_LOGMNR

This section contains the following topics, which relate to using the `DBMS_LOGMNR` package:

Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

> **See Also:** Chapter 55, "DBMS_LOGMNR_D" for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR package.

Constants

The DBMS_LOGMNR package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGMNR.NEW.

Table 54–1 describes the constants for the ADD_LOGFILE options flag in the DBMS_LOGMNR package.

Table 54–1 Constants for ADD_LOGFILE Options Flag

Constant	Description
NEW	Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.
ADDFILE	Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.

Table 54–2 describes the constants for the START_LOGMNR options flag in the DBMS_LOGMNR package.

Table 54–2 Constants for START_LOGMNR Options Flag

Constant	Description
COMMITTED_DATA_ONLY	If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on). If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).
SKIP_CORRUPTION	Directs a select operation on the V$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.
DDL_DICT_TRACKING	If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open. This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9*i*.

Table 54–2 (Cont.) Constants for START_LOGMNR Options Flag

Constant	Description
DICT_FROM_ONLINE_CATALOG	Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed. This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files. Expect to see a value of 2 in the STATUS column of the V$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.
DICT_FROM_REDO_LOGS	If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.
NO_SQL_DELIMITER	If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.
NO_ROWID_IN_STMT	If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled. When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.
PRINT_PRETTY_SQL	If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.
CONTINUOUS_MINE	Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled. Beginning with Oracle Database release 10.1, the CONTINUOUS_MINE options is supported for use in an Oracle Real Application Clusters environment.

Views

The DBMS_LOGMNR package uses the views listed in the section on Accessing LogMiner Operational Information in Views in *Oracle Database Utilities*.

Operational Notes

A **LogMiner session** begins with a call to DBMS_LOGMNR.ADD_LOGFILE or DBMS_LOGMNR.START_LOGMNR (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to DBMS_LOGMNR.END_LOGMNR. Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue SQL SELECT statements against the V$LOGMNR_CONTENTS view to retrieve the data of interest.

Summary of DBMS_LOGMNR Subprograms

Table 54–3 DBMS_LOGMNR Package Subprograms

Subprogram	Description
ADD_LOGFILE Procedure on page 54-10	Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session
COLUMN_PRESENT Function on page 54-12	Call this function for any row returned from the `V$LOGMNR_CONTENTS` view to determine if undo or redo column values exist for the column specified by the `column_name` input parameter to this function
END_LOGMNR Procedure on page 54-14	Finishes a LogMiner session
MINE_VALUE Function on page 54-15	Call this function for any row returned from the `V$LOGMNR_CONTENTS` view to retrieve the undo or redo column value of the column specified by the `column_name` input parameter to this function
REMOVE_LOGFILE Procedure on page 54-17	Removes a redo log file from the list of redo log files for LogMiner to process
START_LOGMNR Procedure on page 54-18	Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to `DBMS_LOGMNR.ADD_LOGFILE`)

ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
   LogFileName     IN VARCHAR2,
   options         IN BINARY_INTEGER default ADDFILE );
```

Parameters

Table 54–4 ADD_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.
options	Does one of the following: ■ Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW) ■ Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE) See Table 54–1, " Constants for ADD_LOGFILE Options Flag".

Exceptions

Table 54–5 ADD_LOGFILE Procedure Exceptions

Exception	Description
ORA-01284	Specified file cannot be opened.
ORA-01287	Specified file is from a different database incarnation.
ORA-01289	Specified file has already been added to the list. Duplicate redo log files cannot be added.
ORA-01290	Specified file is not in the current list and therefore cannot be removed from the list.
ORA-01324	Specified file cannot be added to the list because there is a DB_ID mismatch.

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS_MINE option and you want to analyze more than one redo log file, you must call the ADD_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.

- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)
- To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

COLUMN_PRESENT Function

This function is designed to be used in conjunction with the MINE_VALUE function.

If the MINE_VALUE function returns a NULL value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a NULL value.

To distinguish between these two cases, use the COLUMN_PRESENT function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
     sql_redo_undo      IN  RAW,
     column_name        IN  VARCHAR2 default '') RETURN NUMBER;
```

Parameters

Table 54–6 COLUMN_PRESENT Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 54–7 describes the return values for the COLUMN_PRESENT function. The COLUMN_PRESENT function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of NULL values returned by the DBMS_LOGMNR.MINE_VALUE function.

Table 54–7 Return Values for COLUMN_PRESENT Function

Return	Description
0	Specified column is not present in this row of V$LOGMNR_CONTENTS.
1	Column is present in this row of V$LOGMNR_CONTENTS.

Exceptions

Table 54–8 COLUMN_PRESENT Function Exceptions

Exception	Description
ORA-01323	Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Value specified for the column_name parameter is not a fully qualified column name.

Usage Notes

- To use the COLUMN_PRESENT function, you must have successfully started LogMiner.
- The COLUMN_PRESENT function must be invoked in the context of a select operation on the V$LOGMNR_CONTENTS view.
- The COLUMN_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be NULL).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be NULL).

END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

Exceptions

Table 54–9 END_LOGMNR Procedure Exception

Exception	Description
`ORA-01307`	No LogMiner session is currently active. The `END_LOGMNR` procedure was called without adding any log files or before the `START_LOGMNR` procedure was called

MINE_VALUE Function

This function facilitates queries based on a column's data value. This function takes two arguments. The first one specifies whether to mine the redo (REDO_VALUE) or undo (UNDO_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE_VALUE function always returns a string that can be converted back to the original datatype.

Syntax

```
DBMS_LOGMNR.MINE_VALUE (
     sql_redo_undo      IN  RAW,
     column_name        IN  VARCHAR2 default '') RETURN VARCHAR2;
```

Parameters

Table 54–10 MINE_VALUE Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 54–11 Return Values for MINE_VALUE Function

Return	Description
NULL	The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.
NON-NULL	The column is contained within the self-describing record; the value is returned in string format.

Exceptions

Table 54–12 MINE_VALUE Function Exceptions

Exception	Description
ORA-01323	Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Invalid identifier. The value specified for the column_name parameter was not a fully qualified column name.

Usage Notes

- To use the MINE_VALUE function, you must have successfully started LogMiner.
- The MINE_VALUE function must be invoked in the context of a select operation from the V$LOGMNR_CONTENTS view.

- The MINE_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be null).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be null).

REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

> **Note:** This procedure replaces the REMOVEFILE constant that was an option on the ADD_LOGFILE procedure prior to Oracle Database 10*g*.

Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (
   LogFileName     IN VARCHAR2);
```

Parameters

Table 54–13 REMOVE_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.

Exceptions

Table 54–14 REMOVE_LOGFILE Procedure Exception

Exception	Description
ORA-01290	Cannot remove unlisted log file

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

START_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

Syntax

```
DBMS_LOGMNR.START_LOGMNR (
   startScn           IN NUMBER default 0,
   endScn             IN NUMBER default 0,
   startTime          IN DATE default '01-jan-1988',
   endTime            IN DATE default '31-dec-2110',
   DictFileName       IN VARCHAR2 default '',
   Options            IN BINARY_INTEGER default 0 );
```

Parameters

Table 54–15 START_LOGMNR Procedure Parameters

Parameter	Description
`startScn`	Directs LogMiner to return only redo records with an SCN greater than or equal to the `startScn` specified. This fails if there is no redo log file containing the specified `startScn` value. (You can query the `FILENAME`, `LOW_SCN`, and `NEXT_SCN` columns in the `V$LOGMNR_LOGS` view for each redo log file to determine the range of SCN values contained in each redo log file.)
`endScn`	Directs LogMiner to return only redo records with an SCN less than or equal to the `endScn` specified. If you specify an `endScn` value that is beyond the value in any redo log file, then LogMiner will use the greatest endScn value in the redo log file that contains the most recent changes. (You can query the `FILENAME`, `LOW_SCN`, and `NEXT_SCN` columns in the `V$LOGMNR_LOGS` view for each redo log file to determine the range of SCN values contained in each redo log file.)
`startTime`	Directs LogMiner to return only redo records with a timestamp greater than or equal to the `startTime` specified. This fails if there is no redo log file containing the specified `startTime` value. (You can query the `FILENAME`, `LOW_TIME`, and `HIGH_TIME` columns in the `V$LOGMNR_LOGS` view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if `startScn` is specified. See the Usage Notes for additional information.
`endTime`	Directs LogMiner to return only redo records with a timestamp less than or equal to the `endTime` specified. If you specify an `endTime` value that is beyond the value in any redo log file, then LogMiner will use the greatest `endTime` in the redo log file that contains the most recent changes. You can query the `FILENAME`, `LOW_TIME`, and `HIGH_TIME` columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if `endScn` is specified. See the Usage Notes for additional information.

Table 54–15 (Cont.) START_LOGMNR Procedure Parameters

Parameter	Description
DictFileName	Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct SQL_REDO and SQL_UNDO columns in V$LOGMNR_CONTENTS, as well as to fully translate SEG_NAME, SEG_OWNER, SEG_TYPE_NAME, TABLE_NAME, and TABLE_SPACE columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the DBMS_LOGMNR_D.BUILD procedure.) You need to specify this parameter only if neither DICT_FROM_REDO_LOGS nor DICT_FROM_ONLINE_CATALOG is specified.
options	See Table 54–2, " Constants for START_LOGMNR Options Flag".

Exceptions

Table 54–16 START_LOGMNR Procedure Exceptions

Exception	Description
ORA-01280	Internal error encountered.
ORA-01281	startScn or endScn parameter value is not a valid SCN, or endScn is less than startScn.
ORA-01282	value for the startTime parameter was greater than the value specified for the endTime parameter, or there was no redo log file that was compatible with the date range specified with the startTime and endTime parameters.
ORA-01283	Options parameter specified is invalid.
ORA-01284	LogMiner dictionary file specified in the DictFileName parameter has a full path length greater than 256 characters, or the file cannot be opened.
ORA-01285	Error reading specified file.
ORA-01291	Redo log files that are needed to satisfy the user's requested SCN or time range are missing.
ORA-01292	No log file has been specified for the current LogMiner session.
ORA-01293	Mounted database required for specified LogMiner options.
ORA-01294	Error occurred while processing information in the specified dictionary file, possible corruption.
ORA-01295	Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.
ORA-01296	Character set mismatch between specified LogMiner dictionary and log files.
ORA-01297	Redo version mismatch between LogMiner dictionary and log files.
ORA-01299	Specified LogMiner dictionary corresponds to a different database incarnation.
ORA-01300	Writable database required for specified LogMiner options.

Usage Notes

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system. See *Oracle Database Utilities* and

Chapter 55, "DBMS_LOGMNR_D" in this manual for more information about the LogMiner dictionary.

- After executing the START_LOGMNR procedure, you can query the following views:
  - V$LOGMNR_CONTENTS - contains history of information in redo log files
  - V$LOGMNR_DICTIONARY - contains current information about the LogMiner dictionary file extracted to a flat file
  - V$LOGMNR_PARAMETERS - contains information about the LogMiner session

  (You can query the V$LOGMNR_LOGS view after a redo log file list has been added to the list of files that LogMiner is to mine.)
- Parameters and options are not persistent across calls to DBMS_LOGMNR.START_LOGMNR. You must specify all desired parameters and options (including SCN and time ranges) each time you call DBMS_LOGMNR.START_LOGMNR
- Be aware that specifying redo log files using a timestamp is not precise.
- The CONTINUOUS_MINE option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the CONTINUOUS_MINE option:
  - The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the V$ARCHIVED_LOGS view to determine which redo log file entries will be found by LogMiner.

    Even if an entry is listed in the database control file (and the V$ARCHIVED_LOGS view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be not available.
  - If you specify the CONTINUOUS_MINE option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the V$LOGMNR_CONTENTS view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.
  - LogMiner can mine online redo logs. However, if the CONTINUOUS_MINE option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.
- Keep the following in mind regarding starting and ending times or SCN ranges:

- If you specify neither a startTime nor a startScn parameter, LogMiner will set the startScn parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
- If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
- If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
- If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR without the CONTINUOUS_MINE option, and you specify:
  * 0 for the startTime or startScn value, then the lowest SCN in the LogMiner redo log file list will be used as the startScn
  * A nonzero number for the startTime or startScn value, then an error is returned
  * 0 or a nonzero number for the endTime or endScn value, then the highest SCN in the LogMiner redo log file list will be used as the endScn
- If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR with the CONTINUOUS_MINE option, and you specify:
  * 0 for the startTime or startScn value, then an error is returned.
  * A startTime or startScn value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the V$LOGMNR_CONTENTS view.
  * An endTime or endScn parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
  * 0 for the endTime or endScn parameter value, then LogMiner includes the online redo log files when it mines. When you query the V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until you enter CTL+C or you terminate the PL/SQL cursor.

55

DBMS_LOGMNR_D

The DBMS_LOGMNR_D package, one of a set of LogMiner packages, contains two subprograms:

- The BUILD procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The SET_TABLESPACE procedure re-creates all LogMiner tables in an alternate tablespace.

  The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

  See Also: *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

Using DBMS_LOGMNR_D

This section contains the following topics, which relate to using the `DBMS_LOGMNR_D` package:

Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you. LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

> **See Also:** DBMS_LOGMNR for information on the package subprograms used in running a LogMiner session.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR_D package.

Summary of DBMS_LOGMNR_D Subprograms

Table 55–1 DBMS_LOGMNR_D Package Subprograms

Subprogram	Description
BUILD Procedure on page 55-6	Extracts the LogMiner dictionary to either a flat file or one or more redo log files
SET_TABLESPACE Procedure on page 55-9	Re-creates all LogMiner tables in an alternate tablespace

BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

Syntax

```
DBMS_LOGMNR_D.BUILD (
     dictionary_filename  IN  VARCHAR2,
     dictionary_location  IN  VARCHAR2,
     options              IN  NUMBER);
```

Parameters

Table 55–2 BUILD Procedure Parameters

Parameter	Description
dictionary_filename	Specifies the name of the LogMiner dictionary file.
dictionary_location	Specifies the path to the LogMiner dictionary file directory.
options	Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).

Exceptions

Table 55–3 BUILD Procedure Exceptions

Exception	Description
ora-01302	Dictionary build options are missing or incorrect. This error is returned under the following conditions: ■ If the value of the OPTIONS parameter is not one of the supported values (STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified ■ If the STORE_IN_REDO_LOGS option is not specified and neither the dictionary_filename nor the dictionary_location parameter is specified ■ If the STORE_IN_REDO_LOGS option is specified and either the dictionary_filename or the dictionary_location parameter is specified
ora-01308	Initialization parameter UTL_FILE_DIR is not set.
ora-01336	Specified dictionary file cannot be opened. This error is returned under the following conditions: ■ The specified value for the dictionary_location does not exist. ■ The UTL_FILE_DIR initialization parameter is not set to have access to the dictionary_location ■ The dictionary file is read-only.

Usage Notes

- To extract the LogMiner dictionary to a flat file, you must supply a filename and location.

To extract the LogMiner dictionary to the redo log files, specify only the STORE_IN_REDO_LOGS option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

- If you do not specify any parameters, an error is returned.
- If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
- If you specify a filename and location, as well as the STORE_IN_FLAT_FILE option, the LogMiner dictionary is extracted to a flat file with the specified name.
- If you do not specify a filename and location, but do specify the STORE_IN_REDO_LOGS option, the LogMiner dictionary is extracted to the redo log files.
- If you specify a filename and location, as well as the STORE_IN_REDO_LOGS option, an error is returned.
- If you do not specify a filename and location, but do specify the STORE_IN_FLAT_FILE option, an error is returned.

- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9*i* release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- Do not run the DBMS_LOGMNR_D.BUILD procedure if there are any ongoing DDL operations.
- The database must be open when you run the DBMS_LOGMNR_D.BUILD procedure.
- When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:
  - You must specify a directory for use by the PL/SQL procedure. To do so, set the initialization parameter UTL_FILE_DIR in the initialization parameter file. For example:

    ```
    UTL_FILE_DIR = /oracle/dictionary
    ```

    After setting the parameter, you must shut down and restart the database for this parameter to take effect. If you do not set this parameter, the procedure will fail.
  - You must ensure that no DDL operations occur while the LogMiner dictionary build is running. Otherwise, the LogMiner dictionary file may not contain a consistent snapshot of the database dictionary.

  Be aware that the DDL_DICT_TRACKING option to the DBMS_LOGMNR.START_LOGMNR procedure is not supported for flat file dictionaries created prior to Oracle9*i*. If you attempt to use the DDL_DICT_TRACKING option with a LogMiner database extracted to a flat file prior to Oracle9*i*, the ORA-01330 error (problem loading a required build table) is returned.
- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:

- The DBMS_LOGMNR_D.BUILD procedure must be run on a system that is running Oracle9*i* or later.
- Archivelog mode must be enabled in order to generate usable redo log files.
- The COMPATIBLE parameter in the initialization parameter file must be set to 9.2.0 or higher.
- The database to which LogMiner is attached must be Oracle9*i* or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers. See *Oracle Database Utilities* for information about using supplemental logging with LogMiner.

Examples

Example 1: Extracting the LogMiner Dictionary to a Flat File

The following example extracts the LogMiner dictionary file to a flat file named dictionary.ora in a specified path (/oracle/database).

```
SQL> EXECUTE dbms_logmnr_d.build('dictionary.ora', -
     '/oracle/database/', -
     options => dbms_logmnr_d.store_in_flat_file);
```

Example 2: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -
     options => dbms_logmnr_d.store_in_redo_logs);
```

SET_TABLESPACE Procedure

By default, all LogMiner tables are created to use the SYSAUX tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to an alternate tablespace.

Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (
     new_tablespace        IN VARCHAR2);
```

Parameters

Table 55–4 SET_TABLESPACE Parameter

Parameter	Description
new_tablespace	A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the SYSTEM tablespace. Oracle encourages such users to consider using the SET_TABLESPACE procedure to move the tables to the SYSAUX tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

  See Also: *Oracle Database Concepts* and *Oracle Database SQL Reference* for information about tablespaces and how to create them

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the DBMS_LOGMNR_D.SET_TABLESPACE procedure.

```
SQL> CREATE TABLESPACE  logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'
     SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

56

DBMS_LOGSTDBY

The DBMS_LOGSTDBY package provides subprograms for configuring and managing the logical standby database environment.

> **See Also:** *Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

This chapter contains the following topics:

Using DBMS_LOGSTDBY

This section contains topics which relate to using the `DBMS_LOGSTDBY` package.

Overview

The DBMS_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment. The subprograms in the DBMS_LOGSTDBY package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.

  For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

Operational Notes

Case Sensitivity

Ensure you use the correct case when supplying schema and table names to the DBMS_LOGSTDBY package. For example, the following statements show incorrect and correct syntax for a SKIP procedure that skips changes to OE.TEST.

Incorrect statement:

```
EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'DML', schema_name => 'oe', -
   object_name => 'test', proc_name => null);
```

Because the names are specified with lowercase characters, the transactions that update these columns will still be applied to the logical standby database.

Correct statement:

```
EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'DML', schema_name => 'OE', -
   object_name => 'TEST', proc_name => null);
```

Privileges and Security

A prototype role, LOGSTDBY_ADMINISTRATOR, is created by default with RESOURCE, and EXECUTE on DBMS_LOGSTDBY privileges. If you choose to use this role, consider granting ALTER DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard. Oracle recommends using an account with DBA privileges to perform administration tasks on logical standby databases.

The six procedures associated with skipping transactions (SKIP and UNSKIP, SKIP_ERROR and UNSKIP_ERROR, and SKIP_TRANSACTION and UNSKIP_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

Deprecated Subprograms

The `transaction_consistency` parameter of the APPLY_SET Procedure is being deprecated with this release of the Oracle Database. The `transaction_consistency` parameter is being replaced by the `preserve_commit_order` parameter.

Summary of DBMS_LOGSTDBY Subprograms

Table 56–1 DBMS_LOGSTDBY Package Subprograms

Subprogram	Description
APPLY_SET Procedure on page 56-7	Sets the values of various parameters that configure and maintain SQL Apply
APPLY_UNSET Procedure on page 56-9	Restores the default values of various parameters that configure and maintain SQL Apply
BUILD Procedure on page 56-10	Ensures supplemental logging is enabled properly and builds the LogMiner dictionary
INSTANTIATE_TABLE Procedure on page 56-11	Creates and populates a table in the standby database from a corresponding table in the primary database
PREPARE_FOR_NEW_PRIMARY Procedure on page 56-12	Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency
PURGE_SESSION Procedure on page 56-14	Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply
REBUILD Procedure on page 56-15	Records relevant metadata (including the LogMiner Multiversioned Data Dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process
SET_TABLESPACE Procedure on page 56-16	Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the `SYSAUX` tablespace.
SKIP Procedure on page 56-17	Specifies rules that control database operations that should not be applied to the logical standby database
SKIP_ERROR Procedure on page 56-24	Specifies rules regarding what action to take upon encountering errors
SKIP_TRANSACTION Procedure on page 56-28	Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.
UNSKIP Procedure on page 56-30	Deletes rules specified by the `SKIP` procedure
UNSKIP_ERROR Procedure on page 56-32	Deletes rules specified by the `SKIP_ERROR` procedure
UNSKIP_TRANSACTION Procedure on page 56-34	Deletes rules specified by the `SKIP_TRANSACTION` procedure

APPLY_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. SQL Apply cannot be running when you use this procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
     parameter          IN VARCHAR,
     value              IN VARCHAR);
```

Parameters

Table 56–2 APPLY_SET Procedure Parameters

Parameter	Description
LOG_AUTO_DELETE	Automatically deletes archived redo log files once they have been applied on the logical standby database. Set to TRUE to enable automatic deletion of archived redo log files, and FALSE to disable automatic deletion.The default value is TRUE.
MAX_SGA	Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower.
MAX_SERVERS	Number of parallel query servers that SQL Apply uses to read and apply redo. It defaults to the value of the PARALLEL_MAX_SERVERS initialization parameter or 9, whichever is lower.
MAX_EVENTS_RECORDED	Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value.
PRESERVE_COMMIT_ORDER	TRUE: Transaction are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting. FALSE: Transactions are applied out of order from how they were committed on the primary database, and no attempt is made to provide read-consistent results. Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened in the primary database. See the Usage Notes for details and recommendations.
RECORD_SKIP_ERRORS	Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. Specify one of the following values: TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.

Table 56–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
RECORD_SKIP_DDL	Controls whether skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. Specify one of the following values: TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_APPLIED_DDL	Controls whether DDL statements that have been applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. Specify one of the following values: TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.
APPLY_SERVERS	Controls the number of APPLIER processes (parallel execution servers) used to apply changes
PREPARE_SERVERS	Controls the number of PREPARER processes (parallel execution servers) used to prepare changes

Exceptions

Table 56–3 APPLY_SET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- SQL Apply must be stopped before calling the APPLY_SET procedure.
- Use the APPLY_UNSET procedure to restore the default settings of a parameter.
- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

Examples

To record DDLs in the DBA_LOGSTDBY_EVENTS view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

APPLY_UNSET Procedure

Use the APPLY_UNSET procedure to restore the default values of the parameters that you changed with the APPLY_SET procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
     parameter          IN VARCHAR);
```

Parameters

The parameter information for the APPLY_UNSET procedure is the same as that described for the APPLY_SET procedure. See Table 56–2 for complete parameter information.

Exceptions

Table 56–4 APPLY_UNSET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- SQL Apply must be stopped before calling the APPLY_UNSET procedure.
- Use the APPLY_SET procedure to specify a nondefault value for a parameter.

Examples

If you previously specified that applied DDLs show up in the DBA_LOGSTDBY_EVENTS view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- `DBMS_LOGSTDBY.BUILD` should be run only once for each logical standby database you want to create. You do not need to use DBMS_LOGSTDBY.BUILD for each RAC instance.

Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database. The table requires the name of the database link (`dblink`) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the `INSTANTIATE_TABLE` procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
     schema_name         IN VARCHAR2,
     table_name          IN VARCHAR2,
     dblink              IN VARCHAR2);
```

Parameters

Table 56–5 INSTANTIATE_TABLE Procedure Parameters

Parameter	Description
`schema_name`	Name of the schema
`table_name`	Name of the table to be created or re-created in the standby database
`dblink`	Name of the database link account that has privileges to read and lock the table in the primary database

Exceptions

Table 56–6 INSTANTIATE_TABLE Procedure Exceptions

Exception	Description
`ORA-16103`	Logical Standby apply must be stopped to allow this operation
`ORA-16236`	Logical Standby metadata operation in progress

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until the redo log that was current on the primary database at the time of execution is applied to the standby database.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-
     SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -
     DBLINK => 'INSTANTIATE_TBL_LINK');
```

PREPARE_FOR_NEW_PRIMARY Procedure

The PREPARE_FOR_NEW_PRIMARY procedure must be invoked at a logical standby database following a failover if that standby database was not the target of the failover operation. Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the alert.log. These logs must be copied to the logical standby and registered using the ALTER DATABASE REGISTER LOGICAL LOGFILE statement.

Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
           FORMER_STANDBY_TYPE         IN VARCHAR2,
           DBLINK                      IN VARCHAR2);
```

Parameters

Table 56–7 PREPARE_FOR_NEW_PRIMARY Procedure Parameters

Parameter	Description
FORMER_STANDBY_TYPE	The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.
DBLINK	The name of a database link to the new primary database

Exceptions

Table 56–8 PREPARE_FOR_NEW_PRIMARY Procedure Exceptions

Exception	Description
ORA-16104	Invalid Logical Standby option.
ORA-16109	Failed to apply log data from previous primary.

Usage Notes

- This routine is intended only for logical standby systems.
- This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully.
- Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally.
- Upon manual registration of the terminal logs, users should complete the process by calling either START LOGICAL STANDBY APPLY if the new primary database was formerly a physical standby database or START LOGICAL STANDBY APPLY NEW PRIMARY if the new primary database was formerly a logical standby database.
- See the alert log for more details regarding the reasons for any exception.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (  -
                FORMER_STANDBY_TYPE => 'LOGICAL',    -
                DBLINK => 'dblink_to_newprimary');
```

PURGE_SESSION Procedure

Identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply. Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

Exceptions

Table 56–9 PURGE_SESSION Procedure Exceptions

Exception	Description
ORA-01309	Invalid session

Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the DBA_LOGMNR_PURGED_LOG view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10*g* Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the LOG_AUTO_DELETE parameter described in the DBMS_LOGSTDBY.APPLY_SET procedure described on page 56-7.

Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the DBA_LOGMNR_PURGED_LOG view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;

FILE_NAME
   -----------------------------------
   /boston/arc_dest/arc_1_40_509538672.log
   /boston/arc_dest/arc_1_41_509538672.log
   /boston/arc_dest/arc_1_42_509538672.log
   /boston/arc_dest/arc_1_43_509538672.log
   /boston/arc_dest/arc_1_44_509538672.log
   /boston/arc_dest/arc_1_45_509538672.log
   /boston/arc_dest/arc_1_46_509538672.log
   /boston/arc_dest/arc_1_47_509538672.log
```

3. Use operating system-specific commands to delete archived redo log files from the file system.

REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner Multiversioned Data Dictionary) in the redo stream required for other logical standby databases.

Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

Usage Notes

- LogMiner Multiversioned Data Dictionary information is logged in the redo log files.
- The standby redo log files (if present) are archived.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

SET_TABLESPACE Procedure

Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the SYSAUX tablespace.

Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE(
           NEW_TABLESPACE IN VARCHAR2)
```

Parameters

Table 56–10 SET_TABLE SPACE Procedure Parameters

Parameter	Description
NEW_TABLESPACE	Name of the new tablespace where metadata tables will reside.

Exceptions

Table 56–11 SET_TABLESPACE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress

Examples

To move metadata tables to a new tablespace named LOGSTDBY_TBS, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

SKIP Procedure

The SKIP procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database. For example, the SKIP procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

Syntax

```
DBMS_LOGSTDBY.SKIP (
     stmt                    IN VARCHAR2,
     schema_name             IN VARCHAR2 DEFAULT NULL,
     object_name             IN VARCHAR2 DEFAULT NULL,
     proc_name               IN VARCHAR2 DEFAULT NULL,
     use_like                IN BOOLEAN DEFAULT TRUE,
     esc                     IN CHAR1 DEFAULT NULL);
```

Parameters

Table 56–12 SKIP Procedure Parameters

Parameter	Description
stmt	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 56–13 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
schema_name	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.
object_name	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.

Table 56–12 (Cont.) SKIP Procedure Parameters

Parameter	Description
proc_name	Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: '"schema"."package"."procedure"' This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter ■ IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter ■ IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable ■ IN NAME VARCHAR2 -- The object_name of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid values are: SKIP_ACTION_APPLY -- Execute the statement SKIP_ACTION_SKIP -- Skip the statement SKIP_ACTION_REPLACE -- Execute the replacement statement supplied in the NEW_STATEMENT output parameter
use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the *Oracle Database SQL Reference*.
esc	Identifies an escape character (such as the character "/") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See*Oracle Database SQL Reference* for more information about pattern matching.

Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104: invalid Logical Standby option requested error:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'DML', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'DML_HANDLER');
```

Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the SCHEMA_DDL event for the HR.EMPLOYEES table, and a rule for the ALTER TABLE event for the HR.EMPLOYEES table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'SCHEMA DDL', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'TABLE_ALTER_HANDLER');
```

On encountering an ALTER TABLE statement, the schema_ddl_handler procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement.

Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the empddl_handler procedure being invoked upon encountering the ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMP%', -
     proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'EMPLOYEE_DDL_HANDLER');
```

- Use the SKIP procedure with caution, particularly when skipping DDL statements. If a CREATE TABLE statement is skipped, for example, you must also specify other DDL statements that refer to that table in the SKIP procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the SKIP procedure, SQL Apply must be halted. Do this by issuing an ALTER DATABASE STOP LOGICAL STANDBY APPLY statement. Once all desired filters have been specified, issue an ALTER DATABASE START LOGICAL STANDBY APPLY IMMEDIATE statement to start SQL Apply using the new filter settings.
- See the UNSKIP procedure on page 56-30 for information about reversing (undoing) the settings of the SKIP procedure.
- For USER statements, the SCHEMA_NAME parameter will be the user and specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is supplied, it must already exist in DBA_PROCEDURES and it must execute with DEFINER rights. If the procedure is declared with INVOKER rights, the ORA-1031: insufficient privileges message will be returned.

- If the procedure returns a REPLACEMENT statement, the REPLACEMENT statement will be executed using the SYSTEM and OBJECT privileges of the owner of the procedure.
- The PL/SQL block of a SKIP procedure cannot contain transaction control statements (for example, COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction.

Skip Statement Options

Table 56–13 lists the supported values for the stmt parameter of the SKIP procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. Any of the SQL statements in the right column, however, are also valid values. Note that keywords are generally defined by database object.

Table 56–13 Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
NON_SCHEMA_DDL	*All DDL that does not pertain to a particular schema* **Note:** SCHEMA_NAME and OBJECT_NAME must be null
SCHEMA_DDL	*All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)* **Note:** SCHEMA_NAME and OBJECT_NAME must *not* be null
DML	Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE)
CLUSTER	AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER
CONTEXT	CREATE CONTEXT DROP CONTEXT
DATABASE LINK	CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK
DIMENSION	ALTER DIMENSION CREATE DIMENSION DROP DIMENSION
DIRECTORY	CREATE DIRECTORY DROP DIRECTORY
INDEX	ALTER INDEX CREATE INDEX DROP INDEX

Table 56–13 (Cont.) Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
PROCEDURE[1]	ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE
PROFILE	ALTER PROFILE CREATE PROFILE DROP PROFILE
ROLE	ALTER ROLE CREATE ROLE DROP ROLE SET ROLE
ROLLBACK STATEMENT	ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT
SEQUENCE	ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE
SYNONYM	CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM
TABLE	ALTER TABLE CREATE TABLE DROP TABLE
TABLESPACE	CREATE TABLESPACE DROP TABLESPACE TRUNCATE TABLESPACE
TRIGGER	ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER
TYPE	ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY

Table 56–13 (Cont.) Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
USER	ALTER USER CREATE USER DROP USER
VIEW	CREATE VIEW DROP VIEW

[1] Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

Exceptions

Table 56–14 DBMS_LOGSTDBY.SKIP Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical standby apply must be stopped to allow this operation.
ORA-16104	Invalid logical standby option requested.
ORA-16203	"Unable to interpret SKIP procedure return values." Indicates that a SKIP procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the DBA_LOGSTDBY_EVENTS view.
ORA-16236	Logical standby metadata operation in progress.

Examples

Example 1 Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA DDL', -
     schema_name => 'HR', -
     table_name => '%', -
     proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -
     schema_name => 'HR', -
     table_name => '%', -
     proc_name => null);
```

Example 2 Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a SKIP procedure to handle DDL statements with file specifications transparently.

The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. Create the SKIP procedure to handle tablespace DDL statements:

```
CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl (
```

```
  old_stmt  IN  VARCHAR2,
  stmt_typ  IN  VARCHAR2,
  schema    IN  VARCHAR2,
  name      IN  VARCHAR2,
  xidusn    IN  NUMBER,
  xidslt    IN  NUMBER,
  xidsqn    IN  NUMBER,
  action    OUT NUMBER,
  new_stmt  OUT VARCHAR2
) AS
BEGIN

-- All primary file specification that contains a directory
-- /usr/orcl/primary/dbs
-- should go to /usr/orcl/stdby directory specification

  new_stmt = replace(old_stmt,
                     '/usr/orcl/primary/dbs',
                     '/usr/orcl/stdby');

  action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;

EXCEPTION
  WHEN OTHERS THEN
    action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
    new_stmt := NULL;
END handle_tbs_ddl;
```

2. Register the `SKIP` procedure with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
             proc_name => 'SYS.HANDLE_TBS_DDL');
```

SKIP_ERROR Procedure

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine if the error should cause SQL Apply to stop. All errors to be skipped are stored in system tables that describe how exceptions should be handled.

Syntax

```
DBMS_LOGSTDBY.SKIP_ERROR (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2,
     object_name               IN VARCHAR2,
     proc_name                 IN VARCHAR2,
     use_like                  IN BOOLEAN,
     esc                       IN CHAR1);
```

Parameters

Table 56–15 SKIP_ERROR Procedure Parameters

Parameter	Description
`stmt`	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 56–13 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
`schema_name`	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the `stmt` parameter. If not applicable, this value must be set to `NULL`.
`object_name`	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the `stmt`. If not applicable, this value must be set to `NULL`.

Table 56–15 (Cont.) SKIP_ERROR Procedure Parameters

Parameter	Description
proc_name	Name of a stored procedure to call when SQL Apply determines a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: '"schema"."package"."procedure"' This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR(4000) -- The first 4K of the statement ■ IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter ■ IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable ■ IN NAME VARCHAR2 -- The object_name of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ IN ERROR VARCHAR(4000) -- Text of error to be recorded (optional) ■ OUT NEW_ERROR VARCHAR(4000) -- Null or modified error text
use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the *Oracle Database SQL Reference*.
esc	Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See*Oracle Database SQL Reference* for more information about pattern matching.

Usage Notes

- A stored procedure provided to the SKIP_ERROR procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the STATUS column of the DBA_LOGSTDBY_EVENTS table. The STATUS_CODE column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the NEW_ERROR is written to the events table. To truly have no effect, set NEW_ERROR to ERROR in the procedure.
- If the stored procedure requires that a shutdown be avoided, then you must set NEW_ERROR to NULL.
- This procedure requires DBA privileges to execute.

- For USER statements, the SCHEMA_NAME parameter will be the user and you should specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is specified, it must already exist in DBA_PROCEDURES and it must execute with DEFINERS rights. If the procedure is declared with INVOKERS rights, the ORA-1031: insufficient privileges message will be returned.
- The PL/SQL block of a SKIP_ERROR procedure cannot contain transaction control statements (for example: COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

Exceptions

Table 56–16 SKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Examples

To skip errors on GRANT statements on SYS or HR schemas, define a procedure handle_error_ddl and register it. In the following example, assume that handle_error_ddl is a free-standing procedure in the SYS schema.

1. Create the error-handler procedure:

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl (
  old_stmt    IN  VARCHAR2,
  stmt_type   IN  VARCHAR2,
  schema      IN  VARCHAR2,
  name        IN  VARCHAR2,
  xidusn      IN  NUMBER,
  xidslt      IN  NUMBER,
  xidsqn      IN  NUMBER,
  error       IN  VARCHAR2,
  new_stmt    OUT VARCHAR2
) AS

BEGIN
  -- Default to what we already have
  new_stmt := old_stmt;

  -- Ignore any GRANT errors on SYS or HR schemas
  IF INSTR(UPPER(old_stmt),'GRANT') > 0
  THEN
    IF schema IS NULL
    OR (schema IS NOT NULL AND
          (UPPER(schema) = 'SYS'  OR UPPER(schema) = 'HR' )
    THEN
```

```
      new_stmt := NULL;
      -- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
      -- code not shown here
    END IF;
  END IF;

END handle_error_ddl;
/
```

2. Register the error handler with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
     statement => 'NON_SCHEMA_DDL', -
     schema_name => NULL, -
     object_name => NULL, -
     proc_name => 'SYS.HANDLE_ERROR_DDL');
```

SKIP_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

Syntax

```
DBMS_LOGSTDBY.SKIP_TRANSACTION (
     XIDUSN                IN NUMBER,
     XIDSLT NUMBER         IN NUMBER,
     XIDSQN NUMBER         IN NUMBER);
```

Parameters

Table 56–17 SKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN NUMBER	Transaction ID undo segment number of the transaction being skipped
XIDSLT NUMBER	Transaction ID slot number of the transaction being skipped
XIDSQN NUMBER	Transaction ID sequence number of the transaction being skipped

Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

> **CAUTION: `SKIP_TRANSACTION` is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the `V$LOGMNR_CONTENTS` view and have taken compensating actions at the logical standby database. `SKIP_TRANSACTION` is not the appropriate procedure to invoke to skip DML changes to a table.**
>
> **To skip a DML failure, use a `SKIP` procedure, such as `SKIP('DML','MySchema','MyFailed Table')`. Using the `SKIP_TRANSACTION` procedure for DML transactions may skip changes for other tables, thus logically corrupting them.**

- This procedure requires DBA privileges to execute.
- Use the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.
- Also, see the ALTER DATABASE START LOGICAL STANDBY SKIP FAILED TRANSACTION statement in *Oracle Database SQL Reference*.

Exceptions

Table 56–18 SKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Examples

To skip a DDL transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-
     XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure. The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2,
     object_name               IN VARCHAR2);
```

Parameters

The parameter information for the UNSKIP procedure is the same as that described for the SKIP procedure. See Table 56–12 on page 56-17 for complete parameter information.

Exceptions

Table 56–19 UNSKIP Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

CAUTION: If DML changes for a table have been skipped and not compensated for, you must follow the call to the UNSKIP procedure with a call to the INSTANTIATE_TABLE procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema_name or the object_name parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the UNSKIP procedure, and you will need a distinct UNSKIP procedure call to delete each rule that was previously specified.

  For example, assume you have specified the following two rules to skip applying DML statements to the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPLOYEE', -
     PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPTEMP', -
     PROC_NAME => null);
```

In the following example, the wildcard in the TABLE_NAME parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMP%');
```

In fact, this UNSKIP procedure matches neither of the rules, because the wildcard character in the TABLE_NAME parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding SKIP rule.

UNSKIP_ERROR Procedure

Use the UNSKIP_ERROR procedure to delete rules specified earlier with the SKIP_ERROR procedure. The parameters specified in the UNSKIP_ERROR procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2,
     object_name               IN VARCHAR2);
```

Parameters

The parameter information for the UNSKIP_ERROR procedure is the same as that described for the SKIP_ERROR procedure. See Table 56–15 for complete parameter information.

Exceptions

Table 56–20 UNSKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema_name or the object_name parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the UNSKIP_ERROR procedure, and you need a distinct UNSKIP_ERROR procedure call to delete each rule that you previously specified.

  For example, assume you have specified the following two rules to handle the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPLOYEE', -
     PROC_NAME => 'hr_employee_handler');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPTEMP', -
     PROC_NAME => 'hr_tempemp_handler');
```

  In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMP%');
```

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT_NAME parameter will not be expanded.

Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -
      statement => 'NON_SCHEMA_DDL', -
      schema_name => NULL, -
      object_name => NULL);
```

UNSKIP_TRANSACTION Procedure

Use the UNSKIP_TRANSACTION procedure to delete rules specified earlier with the SKIP_TRANSACTION procedure. The parameters specified in the UNSKIP_TRANSACTION procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
     XIDUSN           NUMBER,
     XIDSLT           NUMBER,
     XIDSQN           NUMBER);
```

Parameters

Table 56–21 UNSKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN	Transaction ID undo segment number of the transaction being skipped
XIDSLT	Transaction ID slot number of the transaction being skipped
XIDSQN	Transaction ID sequence number of the transaction being skipped

Exceptions

Table 56–22 UNSKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Query the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

57

DBMS_METADATA

The DBMS_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

> **See Also:** *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

Using DBMS_METADATA

This section contains topics which relate to using the `DBMS_METADATA` package.

Overview

You can use the DBMS_METADATA package to retrieve metadata and also to submit XML.

- Retrieving Metadata
- Submitting XML

Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

DBMS_METADATA provides the following retrieval interfaces:

- For programmatic use: OPEN, SET_FILTER, SET_COUNT, GET_QUERY, SET_PARSE_ITEM, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, FETCH_xxx, and CLOSE retrieve multiple objects.
- For use in SQL queries and for browsing: GET_XML and GET_DDL return metadata for a single named object. The GET_DEPENDENT_XML, GET_DEPENDENT_DDL, GET_GRANTED_XML, and GET_GRANTED_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, SET_PARSE_ITEM, CONVERT, PUT, and CLOSE.

Security Model

The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- `SYS` and users with `SELECT_CATALOG_ROLE` can see all objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.

Rules and Limits

In an Oracle Shared Server (OSS) environment, the DBMS_METADATA package must disable session migration and connection pooling. This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the MAX_SHARED_SERVERS initialization parameter.

Data Structures - Object and Table Types

The DBMS_METADATA package defines, in the SYS schema, the following OBJECT and TABLE types.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (
  item            VARCHAR2(30),
  value           VARCHAR2(4000),
  object_row      NUMBER )
/

CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;

CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item
/

CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;

CREATE TYPE sys.ku$_ddl AS OBJECT (
   ddlText        CLOB,
parsedItem sys.ku$_parsed_items )
/

CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;

CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl
/

CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;

CREATE TYPE sys.ku$_multi_ddl AS OBJECT (
   object_row     NUMBER,
   ddls           sys.ku$_ddls )
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;

CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR
                          sys.ku$_multi_ddls;

CREATE TYPE sys.ku$_ErrorLine IS OBJECT (
   errorNumber    NUMBER,
   errorText      VARCHAR2(2000) )
/

CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;

CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine
/
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;

CREATE TYPE sys.ku$_SubmitResult AS OBJECT (
   ddl          sys.ku$_ddl,
   errorLines   sys.ku$_ErrorLines );
/
```

```
CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult
/

CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;
```

Subprogram Groupings

The DBMS_METADATA subprograms are used to retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- Table 57–1 provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to retrieve multiple objects from a database.
- Table 57–2 provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to submit XML metadata to a database.

Subprograms for Retrieving Multiple Objects From the Database

Table 57–1 lists the subprograms used for retrieving multiple objects from the database.

Table 57–1 DBMS_METADATA Subprograms for Retrieving Multiple Objects

Subprogram	Description
ADD_TRANSFORM Function on page 57-12	Specifies a transform that `FETCH_xxx` applies to the XML representation of the retrieved objects
CLOSE Procedure on page 57-15	Invalidates the handle returned by `OPEN` and cleans up the associated state
FETCH_xxx Functions and Procedures on page 57-18	Returns metadata for objects meeting the criteria established by `OPEN`, `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on
GET_QUERY Function on page 57-25	Returns the text of the queries that are used by `FETCH_xxx`
GET_xxx Functions on page 57-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
OPEN Function on page 57-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
SET_COUNT Procedure on page 57-36	Specifies the maximum number of objects to be retrieved in a single `FETCH_xxx` call
SET_FILTER Procedure on page 57-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 57-47	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 57-50	Specifies parameters to the XSLT stylesheets identified by `transform_handle`

Subprograms for Submitting XML to the Database

Table 57–2 lists the subprograms used for submitting XML to the database.

Table 57–2 DBMS_METADATA Subprograms for Submitting XML

Subprogram	Description
ADD_TRANSFORM Function on page 57-12	Specifies a transform for the XML documents
CLOSE Procedure on page 57-15	Closes the context opened with `OPENW`
CONVERT Functions and Procedures on page 57-16	Converts an XML document to DDL
OPENW Function on page 57-33	Opens a write context
PUT Function on page 57-34	Submits an XML document to the database
SET_PARSE_ITEM Procedure on page 57-47	Specifies an object attribute to be parsed
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 57-50	`SET_TRANSFORM_PARAM` specifies a parameter to a transform `SET_REMAP_PARAM` specifies a remapping for a transform

Summary of All DBMS_METADATA Subprograms

Table 57–3 DBMS_METADATA Package Subprograms

Subprogram	Description
ADD_TRANSFORM Function on page 57-12	Specifies a transform that FETCH_xxx applies to the XML representation of the retrieved objects
CLOSE Procedure on page 57-15	Invalidates the handle returned by OPEN and cleans up the associated state
CONVERT Functions and Procedures on page 57-16	Converts an XML document to DDL.
FETCH_xxx Functions and Procedures on page 57-18	Returns metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on
GET_xxx Functions on page 57-21	Fetches the metadata for a specified object as XML or DDL, using only a single call
GET_QUERY Function on page 57-25	Returns the text of the queries that are used by FETCH_xxx
OPEN Function on page 57-26	Specifies the type of object to be retrieved, the version of its metadata, and the object model
OPENW Function on page 57-33	Opens a write context
PUT Function on page 57-34	Submits an XML document to the database
SET_COUNT Procedure on page 57-36	Specifies the maximum number of objects to be retrieved in a single FETCH_xxx call
SET_FILTER Procedure on page 57-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 57-47	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 57-50	Specifies parameters to the XSLT stylesheets identified by transform_handle

ADD_TRANSFORM Function

This function is used for both retrieval and submission:

- When this procedure is used to retrieve objects, it specifies a transform that FETCH_xxx applies to the XML representation of the retrieved objects.
- When used to submit objects, it specifies a transform that CONVERT or PUT applies to the XML representation of the submitted objects. It is possible to add more than one transform.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9
- Subprograms for Submitting XML to the Database on page 57-10

Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
   handle       IN NUMBER,
   name         IN VARCHAR2,
   encoding     IN VARCHAR2 DEFAULT NULL,
   object_type  IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 57–4 ADD_TRANSFORM Function Parameters

Parameters	Description
handle	The handle returned from OPEN when this transform is used to retrieve objects. Or the handle returned from OPENW when this transform is used in the submission of XML metadata.
name	The name of the transform. If name contains a period, colon, or forward slash, it is interpreted as the URL of a user-supplied XSLT script. See *Oracle XML DB Developer's Guide.* Otherwise, name designates a transform implemented by this project. The following transforms are defined: ■ DDL - the document is transformed to DDL that creates the object. The output of this transform is *not* an XML document. ■ MODIFY - The document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged.
encoding	The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left NULL and the URL is external to the database, UTF-8 encoding is assumed. If left NULL and the URL is internal to the database (that is, it begins with /oradb/), then the encoding is assumed to be the database character set.

Table 57–4 (Cont.) ADD_TRANSFORM Function Parameters

Parameters	Description
object_type	The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata. 1. When you use ADD_TRANFORM to retrieve objects, the following definition of object_type applies: Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur: ■ if object_type is omitted, the transform applies to all object types within the heterogeneous collection ■ if object_type is specified, the transform only applies to that specific object type within the collection If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type. 2. When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.

Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. Transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of the DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. ADD_TRANSFORM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:

- `encoding` is specified even though name is not a URL
- `object_type` is not part of the collection designated by handle

CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by OPEN (or OPENW) and cleans up the associated state.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9
- Subprograms for Submitting XML to the Database on page 57-10

Syntax

```
DBMS_METADATA.CLOSE (
   handle  IN NUMBER);
```

Parameters

Table 57–5 CLOSE Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).

Usage Notes

Note: The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by OPEN or (OPENW).

- If a call to FETCH_xxx returns NULL, indicating no more objects, a call to CLOSE is made transparently. In this case, you can still call CLOSE on the handle and not get an exception. (The call to CLOSE is not required.)
- If you know that only one specific object will be returned, you should explicitly call CLOSE after the single FETCH_xxx call to free resources held by the handle.

Exceptions

- INVALID_ARGVAL. The value for the handle parameter is NULL or invalid.

CONVERT Functions and Procedures

The CONVERT functions and procedures transform input XML documents. The CONVERT functions return creation DDL. The CONVERT procedures return either XML or DDL, depending on the specified transforms.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Submitting XML to the Database on page 57-10

Syntax

The CONVERT functions are as follows:

```
DBMS_METADATA.CONVERT (
   handle   IN NUMBER,
   document IN sys.XMLType)
 RETURN sys.ku$_multi_ddls;

DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB)
 RETURN sys.ku$_multi_ddls;
```

The CONVERT procedures are as follows:

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN sys.XMLType,
  result   IN OUT NOCOPY CLOB);

DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB,
  result   IN OUT NOCOPY CLOB);
```

Parameters

Table 57–6 CONVERT Subprogram Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata of the type of the OPENW handle.
result	The converted document.

Return Values

DDL to create the object(s).

Usage Notes

You can think of CONVERT as the second half of FETCH_xxx, either FETCH_DDL (for the function variants) or FETCH_CLOB (for the procedure variants). There are two differences:

- FETCH_xxx gets its XML document from the database, but CONVERT gets its XML document from the caller
- FETCH_DDL returns its results in a sys.ku$_ddls nested table, but CONVERT returns a sys.ku$_multi_ddls nested table

The transforms specified with ADD_TRANSFORM are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the parsedItems column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. No transform was specified. The DDL transform was not specified (function variants only).
- INCOMPATIBLE_DOCUMENT. The version of the XML document is not compatible with this version of the software.

FETCH_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. See "Usage Notes" on page 57-19 for the variants.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 57-9

Syntax

The FETCH functions are as follows:

```
DBMS_METADATA.FETCH_XML (
   handle  IN NUMBER)
RETURN sys.XMLType;
```

> **See Also:** *Oracle XML DB Developer's Guide* for a description of XMLType

```
DBMS_METADATA.FETCH_DDL (
   handle  IN NUMBER)
RETURN sys.ku$_ddls;

DBMS_METADATA.FETCH_CLOB (
   handle       IN NUMBER,
   cache_lob    IN BOOLEAN DEFAULT TRUE,
   lob_duration IN PLS INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The FETCH procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
   handle  IN NUMBER,
   doc     IN OUT NOCOPY CLOB);

DBMS_METADATA.FETCH_XML_CLOB (
   handle  IN NUMBER,
   doc     IN OUT NOCOPY CLOB,
   parsed_items OUT sys.ku$_parsed_items,
   object_type_path OUT VARCHAR2);
```

Parameters

Table 57–7 FETCH_xxx Function Parameters

Parameters	Description
handle	The handle returned from OPEN.
cache_lob	TRUE=read LOB into buffer cache
lob_duration	The duration for the temporary LOB created by FETCH_CLOB, either DBMS_LOB.SESSION (the default) or DBMS_LOB.CALL.
doc	The metadata for the objects, or NULL if all objects have been returned.

Table 57–7 (Cont.) FETCH_xxx Function Parameters

Parameters	Description
parsed_items	A nested table containing the items specified by SET_PARSE_ITEM. If SET_PARSE_ITEM was not called, a NULL is returned.
object_type_path	For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to FETCH_XXX. If handle designates a homogeneous object type, a NULL is returned.

Return Values

The metadata for the objects or NULL if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to OPEN that returned the handle, and subsequent calls to SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. Each call to FETCH_xxx returns the number of objects specified by SET_COUNT (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to FETCH_xxx return NULL and cause the stream created by OPEN to be transparently closed.

There are several different FETCH_xxx functions and procedures:

- The FETCH_XML function returns the XML metadata for an object as an XMLType. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The FETCH_DDL function returns the DDL (to create the object) in a sys.ku$_ddls nested table. It assumes that the DDL transform has been specified. Each row of the sys.ku$_ddls nested table contains a single DDL statement in the ddlText column; if requested, parsed items for the DDL statement will be returned in the parsedItems column. Multiple DDL statements may be returned under the following circumstances:
  - When you call SET_COUNT to specify a count greater than 1
  - When an object is transformed into multiple DDL statements. For example, A TYPE object that has a DDL transform applied to it can be transformed into both CREATE TYPE and CREATE TYPE BODY statements. A TABLE object can be transformed into a CREATE TABLE, and one or more ALTER TABLE statements
- The FETCH_CLOB function simply returns the object, transformed or not, as a CLOB. By default, the CLOB is read into the buffer cache and has session duration, but these defaults can be overridden with the cache_lob and lob_duration parameters.
- The FETCH_CLOB procedure returns the objects by reference in an IN OUT NOCOPY parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The FETCH_XML_CLOB procedure returns the XML metadata for the objects as a CLOB in an IN OUT NOCOPY parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

- All LOBs returned by FETCH_xxx are temporary LOBs. You must free the LOB. If the LOB is supplied as an IN OUT NOCOPY parameter, you must also create the LOB.
- If SET_PARSE_ITEM was called, FETCH_DDL and FETCH_XML_CLOB return attributes of the object's metadata (or the DDL statement) in a sys.ku$_parsed_items nested table. For FETCH_XML_CLOB, the nested table is an OUT parameter. For FETCH_DDL, it is a column in the returned sys.ku$_ddls nested table. Each row of the nested table corresponds to an item specified by SET_PARSE_ITEM and contains the following columns:
  - item—the name of the attribute as specified in the name parameter to SET_PARSE_ITEM.
  - value—the attribute value, or NULL if the attribute is not present in the DDL statement.
  - object-row—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by FETCH_xxx, (because SET_COUNT specified a count greater than 1) then object_row=1 for all items for the first object, 2 for the second, and so on.
- The rows of the sys.ku$_parsed_items nested table are ordered by ascending object_row, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on item.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be NULL.
- If SET_PARSE_ITEM was not called, NULL is returned as the value of the parsed items nested table.
- It is expected that the same variant of FETCH_xxx will be called for all objects selected by OPEN. That is, programs will not intermix calls to FETCH_XML, FETCH_DDL, FETCH_CLOB, and so on using the same OPEN handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the FETCH_xxx calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. Either FETCH_XML was called when the DDL transform had been specified, or FETCH_DDL was called when the DDL transform had *not* been specified.

GET_xxx Functions

The following GET_xxx functions let you fetch metadata for objects with a single call:

- GET_XML
- GET_DDL
- GET_DEPENDENT_XML
- GET_DEPENDENT_DDL
- GET_GRANTED_XML
- GET_GRANTED_DDL

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9

Syntax

```
DBMS_METADATA.GET_XML (
object_type     IN VARCHAR2,
name            IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA.GET_DDL (
object_type     IN VARCHAR2,
name            IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL')
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_XML (
object_type        IN VARCHAR2,
base_object_name   IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version            IN VARCHAR2 DEFAULT 'COMPATIBLE',
model              IN VARCHAR2 DEFAULT 'ORACLE',
transform          IN VARCHAR2 DEFAULT NULL,
object_count       IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_DDL (
object_type         IN VARCHAR2,
base_object_name    IN VARCHAR2,
base_object_schema  IN VARCHAR2 DEFAULT NULL,
version             IN VARCHAR2 DEFAULT 'COMPATIBLE',
model               IN VARCHAR2 DEFAULT 'ORACLE',
transform           IN VARCHAR2 DEFAULT 'DDL',
object_count        IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_XML (
```

```
object_type     IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL,
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_DDL (
object_type     IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

Parameters

Table 57–8 GET_xxx Function Parameters

Parameter	Description
object_type	The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.
name	The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified See Table 57–17 for a list of filters.
schema	The object schema. It is used internally in a SCHEMA filter. The default is the current user.
version	The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.
model	The object model to use. This parameter takes the same values as the OPEN model parameter.
transform	The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.
base_object_name	The base object name. It is used internally in a BASE_OBJECT_NAME filter.
base_object_schema	The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.
grantee	The grantee. It is used internally in a GRANTEE filter. The default is the current user.
object_count	The maximum number of objects to return. See SET_COUNT Procedure on page 57-36.

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML or DDL.
  - GET_xxx is used to fetch named objects, especially schema objects (tables, views).
  - GET_DEPENDENT_xxx is used to fetch dependent objects (audits, object grants).
  - GET_GRANTED_xxx is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET_xxx to fetch an index by name, or GET_DEPENDENT_xxx to fetch the same index by specifying the table on which it is defined.
- GET_xxx only returns a single named object.
- For GET_DEPENDENT_xxx and GET_GRANTED_xxx, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)
- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND. The specified object was not found in the database.

Examples

Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE','EMP','SCOTT')
FROM DUAL;
```

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses SET_TRANSFORM_PARAM (with the handle value = DBMS_METADATA.SESSION_TRANSFORM meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
```

```
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM,'STORAGE',false);
SELECT DBMS_METADATA.GET_DDL('TABLE',u.table_name)
     FROM USER_ALL_TABLES u
     WHERE u.nested='NO'
     AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM,'DEFAULT');
```

Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
    'EMPLOYEES','HR') FROM DUAL;
```

Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT','SCOTT')
    FROM DUAL;
```

GET_QUERY Function

This function returns the text of the queries that are used by FETCH_xxx. This function assists in debugging.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9

Syntax

```
DBMS_METADATA.GET_QUERY (
   handle  IN NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 57–9 GET_QUERY Function Parameters

Parameter	Description
handle	The handle returned from OPEN. It cannot be the handle for a heterogeneous object type.

Return Values

The text of the queries that will be used by FETCH_xxx.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for the handle parameter.

OPEN Function

This function specifies the type of object to be retrieved, the version of its metadata, and the object model. The return value is an opaque context handle for the set of objects to be used in subsequent calls.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9

Syntax

```
DBMS_METADATA.OPEN (
   object_type  IN VARCHAR2,
   version      IN VARCHAR2 DEFAULT 'COMPATIBLE',
   model        IN VARCHAR2 DEFAULT 'ORACLE',
   network_link IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 57–10 Open Function Parameters

Parameter	Description
`object_type`	The type of object to be retrieved. Table 57–11 lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see `model` in this table). The Attributes column in Table 57–11 specifies some object type attributes: ■ Schema objects, such as tables, belong to schemas. ■ Named objects have unique names (if they are schema objects, the name is unique to the schema). ■ Dependent objects, such as indexes, are defined with reference to a base schema object. ■ Granted objects are granted or assigned to a user or role and therefore have a named grantee. ■ Heterogeneous object types denote a collection of related objects of different types. See Table 57–12 for a listing of object types returned for the heterogeneous object type. These attributes are relevant when choosing object selection criteria. See "SET_FILTER Procedure" on page 57-37 for more information.
`version`	The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: `COMPATIBLE` (default)—the version of the metadata corresponds to the database compatibility level. `LATEST`—the version of the metadata corresponds to the database version. A specific database version, for example, 9.2.0. As of Oracle Database 10*g*, this value cannot be lower than 9.2.0.

Table 57–10 (Cont.) Open Function Parameters

Parameter	Description
model	Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported as of Oracle Database 10*g*.
network_link	Reserved.

Table 57–11 provides the name, meaning, attributes, and notes for the DBMS_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

Table 57–11 DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
AQ_QUEUE	queues	SND	Dependent on table
AQ_QUEUE_TABLE	additional metadata for queue tables	ND	Dependent on table
AQ_TRANSFORM	transforms	SN	None
ASSOCIATION	associate statistics	D	None
AUDIT	audits of SQL statements	DG	Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited.
AUDIT_OBJ	audits of schema objects	D	None
CLUSTER	clusters	SN	None
COMMENT	comments	D	None
CONSTRAINT	constraints	SND	Does not include: ▪ primary key constraint for IOT ▪ column NOT NULL constraints ▪ certain REF SCOPE and WITH ROWID constraints for tables with REF columns
CONTEXT	application contexts	N	None
DATABASE_EXPORT	all metadata objects in a database	H	Corresponds to a full database export
DB_LINK	database links	SN	Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner.
DEFAULT_ROLE	default roles	G	Granted to a user by ALTER USER
DIMENSION	dimensions	SN	None
DIRECTORY	directories	N	None
FGA_POLICY	fine-grained audit policies	D	Not modeled as named object because policy names are not unique.
FUNCTION	stored functions	SN	None

Table 57–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
INDEX_STATISTICS	precomputed statistics on indexes	D	The base object is the index's table.
INDEX	indexes	SND	None
INDEXTYPE	indextypes	SN	None
JAVA_SOURCE	Java sources	SN	None
JOB	jobs	S	None
LIBRARY	external procedure libraries	SN	None
MATERIALIZED_VIEW	materialized views	SN	None
MATERIALIZED_ VIEW_LOG	materialized view logs	D	None
OBJECT_GRANT	object grants	DG	None
OPERATOR	operators	SN	None
OUTLINE	stored outlines	N	This type is being deprecated.
PACKAGE	stored packages	SN	By default, both package specification and package body are retrieved. See "SET_ FILTER Procedure" on page 57-37.
PACKAGE_SPEC	package specifications	SN	None
PACKAGE_BODY	package bodies	SN	None
PROCEDURE	stored procedures	SN	None
PROFILE	profiles	N	None
PROXY	proxy authentications	G	Granted to a user by ALTER USER
REF_CONSTRAINT	referential constraint	SND	None
REFRESH_GROUP	refresh groups	SN	None
RESOURCE_COST	resource cost info		None
RLS_CONTEXT	driving contexts for enforcement of fine-grained access-control policies	D	Corresponds to the DBMS_RLS.ADD_ POLICY_CONTENT procedure
RLS_GROUP	fine-grained access-control policy groups	D	Corresponds to the DBMS_RLS.CREATE_ GROUP procedure
RLS_POLICY	fine-grained access-control policies	D	Corresponds to DBMS_RLS.ADD_ GROUPED_POLICY. Not modeled as named objects because policy names are not unique.
RMGR_CONSUMER_ GROUP	resource consumer groups	SN	Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects.
RMGR_INTITIAL_ CONSUMER_GROUP	assign initial consumer groups to users	G	None
RMGR_PLAN	resource plans	SN	None
RMGR_PLAN_ DIRECTIVE	resource plan directives	D	Dependent on resource plan
ROLE	roles	N	None

Table 57–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
ROLE_GRANT	role grants	G	None
ROLLBACK_SEGMENT	rollback segments	N	None
SCHEMA_EXPORT	all metadata objects in a schema	H	Corresponds to user-mode export.
SEQUENCE	sequences	SN	None
SYNONYM	synonyms	See notes	Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in CREATE PUBLIC SYNONYM FOO FOR BAR, the resultant object is considered to have name FOO and schema PUBLIC.
SYSTEM_GRANT	system privilege grants	G	None
TABLE	tables	SN	None
TABLE_DATA	metadata describing row data for a table, nested table, or partition	SND	For partitions, the object name is the partition name. For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table (*not* the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself.
TABLE_EXPORT	metadata for a table and its associated objects	H	Corresponds to table-mode export
TABLE_STATISTICS	precomputed statistics on tables	D	None
TABLESPACE	tablespaces	N	None
TABLESPACE_QUOTA	tablespace quotas	G	Granted with ALTER USER
TRANSPORTABLE_EXPORT	metadata for objects in a transportable tablespace set	H	Corresponds to transportable tablespace export
TRIGGER	triggers	SND	None
TRUSTED_DB_LINK	trusted links	N	None
TYPE	user-defined types	SN	By default, both type and type body are retrieved. See "SET_FILTER Procedure" on page 57-37.
TYPE_SPEC	type specifications	SN	None
TYPE_BODY	type bodies	SN	None
USER	users	N	None
VIEW	views	SN	None
XMLSCHEMA	XML schema	SN	The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it.

Table 57–12 lists the types of objects returned for the major heterogeneous object types. For SCHEMA_EXPORT, certain object types are only returned if the INCLUDE_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE_USER.

Table 57–12 Object Types Returned for the Heterogeneous Object Type

Object Type	DATABASE_ EXPORT	SCHEMA_ EXPORT	TABLE_ EXPORT	TRANSPORTABLE_ EXPORT
ASSOCIATION	Yes	No	No	No
AUDIT	Yes	No	No	No
AUDIT_OBJ	Yes	Yes	Yes	Yes

TYPE_SPEC	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
TYPE_BODY	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
USER	Yes	INCLUDE_USER	No	No
VIEW	Yes	Yes	No	No
XMLSCHEMA	Yes	Yes	No	No

Return Values

An opaque handle to the class of objects. This handle is used as input to SET_FILTER, SET_COUNT, ADD_TRANSFORM, GET_QUERY, SET_PARSE_ITEM, FETCH_xxx, and CLOSE.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `version` or `model` parameter was not valid for the `object_type`.

OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

See Also: For more information about related subprograms:

- Subprograms for Submitting XML to the Database on page 57-10

Syntax

```
DBMS_METADATA.OPENW
  (object_type  IN VARCHAR2,
  version       IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model         IN VARCHAR2 DEFAULT 'ORACLE')
 RETURN NUMBER;
```

Parameters

Table 57–13 OPENW Function Parameters

Parameter	Description
object_type	The type of object to be submitted. Valid types names and their meanings are listed in Table 57–11. The type cannot be a heterogeneous object type.
version	The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: ■ COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher. ■ LATEST - The version of the DDL corresponds to the database version. ■ A specific database version. As of Oracle Database 10*g*, this value cannot be lower than 9.2.0.
model	Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.

Return Values

An opaque handle to write context. This handle is used as input to the ADD_TRANSFORM, CONVERT, PUT, and CLOSE procedures.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The model parameter was not valid for the object_type.

PUT Function

This function submits an XML document containing object metadata to the database to create the object.

See Also: For more information about related subprograms:

- Subprograms for Submitting XML to the Database on page 57-10

Syntax

```
DBMS_METADATA.PUT (
   handle     IN             NUMBER,
   document   IN             sys.XMLType,
   flags      IN             NUMBER,
   results    IN OUT NOCOPY  sys.ku$_SubmitResults)
  RETURN BOOLEAN;

DBMS_METADATA.PUT (
   handle     IN             NUMBER,
   document   IN             CLOB,
   flags      IN             NUMBER,
   results    IN OUT NOCOPY  sys.ku$_SubmitResults)
 RETURN BOOLEAN;
```

Parameters

Table 57–14 PUT Function Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata for the type of the OPENW handle.
flags	Reserved for future use
results	Detailed results of the operation.

Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the sys.ku$_SubmitResults nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. The DDL transform was not specified.
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

SET_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single FETCH_xxx call. By default, each call to FETCH_xxx returns one object. You can use the SET_COUNT procedure to override this default. If FETCH_xxx is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single FETCH_xxx operation only returns objects of a single object type.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9

Syntax

```
DBMS_METADATA.SET_COUNT (
   handle           IN NUMBER,
   value            IN NUMBER,
   object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57–15 SET_COUNT Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
value	The maximum number of objects to retrieve.
object_type_path	A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: ■ if object_type_path is omitted, the count applies to all object types within the heterogeneous collection ■ if object_type_path is specified, the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_COUNT was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_COUNT for the current OPEN context are permitted.
- INCONSISTENT_ARGS. object_type parameter is not consistent with handle.

SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9

Syntax

```
DBMS_METADATA.SET_FILTER (
   handle           IN NUMBER,
   name             IN VARCHAR2,
   value            IN VARCHAR2,
   object_type_path IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_FILTER (
   handle            IN NUMBER,
   name              IN VARCHAR2,
   value             IN BOOLEAN DEFAULT TRUE,
   object_type_path  IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_FILTER (
   handle            IN NUMBER,
   name              IN VARCHAR2,
   value             IN NUMBER,
   object_type_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57–16 SET_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
name	The name of the filter. For each filter, Table 57–17 lists the object_type it applies to, its name, its datatype (text or Boolean) and its meaning or effect (including its default value, if any). The Datatype column of Table 57–17 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.)) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (*not* a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXPR filter in PL/SQL is as follows: 'IN (''DEPT'',''EMP'')' The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.
value	The value of the filter. Text, Boolean, and Numeric filters are supported.

Table 57–16 (Cont.) SET_FILTER Procedure Parameters

Parameter	Description
object_type_path	A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 57–18 for a listing of some of the values for this parameter.

Table 57–17 describes the object type, name, datatype, and meaning of the filters available with the SET_FILTER procedure.

Table 57–17 SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Named objects	NAME	text	Objects with this exact name are selected.
Named objects	NAME_EXPR	text expression	The filter value is combined with the object attribute corresponding to the object name to produce a WHERE condition in the query that fetches the objects. By default, all named objects of object_type are selected.
Named objects	EXCLUDE_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched. By default, all named objects of the object type are selected.
Schema objects	SCHEMA	text	Objects in this schema are selected. If the object type is SYNONYM, specify PUBLIC to select public synonyms.
Schema objects	SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's schema. The default is determined as follows: - if BASE_OBJECT_SCHEMA is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected.
PACKAGE, TYPE	SPECIFICATION	Boolean	If TRUE, retrieve the package or type specification. Defaults to TRUE.
PACKAGE, TYPE	BODY	Boolean	If TRUE, retrieve the package or type body. Defaults to TRUE.
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE	text	Objects in this tablespace (or having a partition in this tablespace) are selected.

Table 57–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE, CLUSTER, INDEX,TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_ EXPORT	TABLESPACE_ EXPR	text expression	The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected.
TABLE, objects dependent on tables	PRIMARY	Boolean	If TRUE, retrieve primary tables (that is, tables for which the secondary object bit in obj$ is clear. Defaults to TRUE.
TABLE, objects dependent on tables	SECONDARY	Boolean	If TRUE, retrieve secondary tables (that is, tables for which the secondary object bit in obj$ is set). Defaults to TRUE.
Dependent Objects	BASE_OBJECT_ NAME	text	Objects are selected that are defined or granted on objects with this name. Specify SCHEMA for triggers on schemas. Specify DATABASE for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column.
Dependent Objects	BASE_OBJECT_ SCHEMA	text	Objects are selected that are defined or granted on objects in this schema. If BASE_OBJECT_NAME is specified with a value other than SCHEMA or DATABASE, this defaults to the current schema.
Dependent Objects	BASE_OBJECT_ NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers.
Dependent Objects	EXCLUDE_BASE_ OBJECT_NAME_ EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers.
Dependent Objects	BASE_OBJECT_ SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the schema of the base object.
Dependent Objects	BASE_OBJECT_ TYPE	text	The object type of the base object.
Dependent Objects	BASE_OBJECT_ TYPE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type.
Dependent Objects	BASE_OBJECT_ TABLESPACE	text	The tablespace of the base object.
Dependent Objects	BASE_OBJECT_ TABLESPACE_ EXPR	text expression	The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace.
INDEX, TRIGGER	SYSTEM_ GENERATED	Boolean	If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE.
Granted Objects	GRANTEE	text	Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC.
Granted Objects	PRIVNAME	text	The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified.

Table 57–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Granted Objects	PRIVNAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the privilege or role name. By default, all privileges/roles are returned.
Granted Objects	GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name.
Granted Objects	EXCLUDE_ GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched.
OBJECT_GRANT	GRANTOR	text	Object grants are selected that are granted by this user.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME	text	A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME_EXPR	text	The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object.
All objects	CUSTOM_FILTER	text	The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used. The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exists for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed.
SCHEMA_EXPORT	SCHEMA	text	The schema whose objects are selected.
SCHEMA_EXPORT	SCHEMA_EXPR	text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects. By default the current user's objects are selected.
SCHEMA_EXPORT	INCLUDE_USER	Boolean	If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA. Defaults to FALSE.
TABLE_EXPORT	SCHEMA	text	Objects (tables and their dependent objects) in this schema are selected.
TABLE_EXPORT	SCHEMA_EXPR	text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects. By default the current user's objects are selected.

Table 57–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	NAME	text	The table with this exact name is selected along with its dependent objects.
TABLE_EXPORT	NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects.
Heterogeneous objects	BEGIN_WITH	text	The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.
Heterogeneous objects	BEGIN_AFTER	text	The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.
Heterogeneous objects	END_BEFORE	text	The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.
Heterogeneous objects	END_WITH	text	The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.
Heterogeneous objects	INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR	text expression	For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 57–18 for valid path names that can be used with these filters. BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.

Usage Notes

- Each call to SET_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are ANDed together, so you can use multiple SET_FILTER calls to refine the set of objects to be returned. For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle,'SCHEMA','SCOTT');
SET_FILTER(handle,'NAME','EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle,'NAME_EXPR','>=''FELIX''');
```

```
SET_FILTER(handle,'NAME_EXPR','<=''OSCAR''');
```

- With SET_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has SELECT_CATALOG_ROLE, then any object can be retrieved; otherwise, only the following can be retrieved:
  - Schema objects owned by the current user
  - Public synonyms
  - System privileges granted to the current user or to PUBLIC
  - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
  - SCHEMA_EXPORT where the name is the current user
  - TABLE_EXPORT where SCHEMA is the current user

  If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

  In stored procedures, functions, and definers-rights packages, roles (such as SELECT_CATALOG_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT_CATALOG_ROLE), you must make the program invokers-rights.
- For heterogeneous object types, the BEGIN_WITH and BEGIN_AFTER filters allow restart on an object type boundary. Appropriate filter values are returned by the FETCH_XML_CLOB procedure.

  Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for SCHEMA_EXPORT the NAME filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a NAME_EXPR filter explicitly for the TABLE object type path. Table 57–18 lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS.) See Table 57–17 for filters defined for each path name. These path names are valid in the INCLUDE_PATH_EXPR and EXCLUDE_PATH_EXPR filters. Path names marked with an asterisk (*) are *only* valid in those filters; they cannot be used as values of the SET_FILTER object_type_path parameter.

Table 57–18 Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	AUDIT_OBJ	Object audits on the selected tables
TABLE_EXPORT	COMMENT	Table and column comments for the selected tables
TABLE_EXPORT	CONSTRAINT	Constraints (including referential constraints) on the selected tables
TABLE_EXPORT	*GRANT	Object grants on the selected tables

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	INDEX	Indexes (including domain indexes) on the selected tables
TABLE_EXPORT	OBJECT_GRANT	Object grants on the selected tables
TABLE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on the selected tables
TABLE_EXPORT	STATISTICS	Statistics on the selected tables
TABLE_EXPORT	TABLE_DATA	Row data for the selected tables
TABLE_EXPORT	TRIGGER	Triggers on the selected tables
SCHEMA_EXPORT	ASSOCIATION	Statistics type associations for objects in the selected schemas
SCHEMA_EXPORT	AUDIT_OBJ	Audits on all objects in the selected schemas
SCHEMA_EXPORT	CLUSTER	Clusters in the selected schemas and their indexes
SCHEMA_EXPORT	COMMENT	Comments on all objects in the selected schemas
SCHEMA_EXPORT	CONSTRAINT	Constraints (including referential constraints) on all objects in the selected schemas
SCHEMA_EXPORT	DB_LINK	Private database links in the selected schemas
SCHEMA_EXPORT	DEFAULT_ROLE	Default roles granted to users associated with the selected schemas
SCHEMA_EXPORT	DIMENSION	Dimensions in the selected schemas
SCHEMA_EXPORT	FUNCTION	Functions in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	*GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters in the selected schemas
SCHEMA_EXPORT	INDEXTYPE	Indextypes in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JAVA_SOURCE	Java sources in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JOB	Jobs in the selected schemas
SCHEMA_EXPORT	LIBRARY	External procedure libraries in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW	Materialized views in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs on tables in the selected schemas
SCHEMA_EXPORT	OBJECT_GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	OPERATOR	Operators in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE	Packages (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE_BODY	Package bodies in the selected schemas
SCHEMA_EXPORT	PACKAGE_SPEC	Package specifications in the selected schemas
SCHEMA_EXPORT	PASSWORD_HISTORY	The password history for users associated with the selected schemas

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
SCHEMA_EXPORT	PROCEDURE	Procedures in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the selected schemas
SCHEMA_EXPORT	REFRESH_GROUP	Refresh groups in the selected schemas
SCHEMA_EXPORT	SEQUENCE	Sequences in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	STATISTICS	Statistics on tables and indexes in the selected schemas
SCHEMA_EXPORT	SYNONYM	Private synonyms in the selected schemas
SCHEMA_EXPORT	TABLE	Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
SCHEMA_EXPORT	TABLE_DATA	Row data for tables in the selected schemas
SCHEMA_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users associated with the selected schemas
SCHEMA_EXPORT	TRIGGER	Triggers on tables in the selected schemas
SCHEMA_EXPORT	TYPE	Types (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	TYPE_BODY	Type bodies in the selected schemas
SCHEMA_EXPORT	TYPE_SPEC	Type specifications in the selected schemas
SCHEMA_EXPORT	USER	User definitions for users associated with the selected schemas
SCHEMA_EXPORT	VIEW	Views in the selected schemas and their dependent objects (grants, constraints, comments, audits)
DATABASE_EXPORT	ASSOCIATION	Statistics type associations for objects in the database
DATABASE_EXPORT	AUDIT	Audits of SQL statements
DATABASE_EXPORT	AUDIT_OBJ	Audits on all objects in the database
DATABASE_EXPORT	CLUSTER	Clusters and their indexes
DATABASE_EXPORT	COMMENT	Comments on all objects
DATABASE_EXPORT	CONSTRAINT	Constraints (including referential constraints)
DATABASE_EXPORT	CONTEXT	Application contexts
DATABASE_EXPORT	DB_LINK	Private and public database links
DATABASE_EXPORT	DEFAULT_ROLE	Default roles granted to users in the database
DATABASE_EXPORT	DIMENSION	Dimensions in the database
DATABASE_EXPORT	DIRECTORY	Directory objects in the database
DATABASE_EXPORT	FGA_POLICY	Fine-grained audit policies
DATABASE_EXPORT	FUNCTION	Functions
DATABASE_EXPORT	* GRANT	Object and system grants
DATABASE_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters
DATABASE_EXPORT	INDEXTYPE	Indextypes and their dependent grants and audits

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	JAVA_SOURCE	Java sources and their dependent grants and audits
DATABASE_EXPORT	JOB	Jobs
DATABASE_EXPORT	LIBRARY	External procedure libraries
DATABASE_EXPORT	MATERIALIZED_VIEW	Materialized views
DATABASE_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs
DATABASE_EXPORT	OBJECT_GRANT	All object grants in the database
DATABASE_EXPORT	OPERATOR	Operators and their dependent grants and audits
DATABASE_EXPORT	PACKAGE	Packages (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	PACKAGE_BODY	Package bodies
DATABASE_EXPORT	PACKAGE_SPEC	Package specifications
DATABASE_EXPORT	PASSWORD_HISTORY	Password histories for database users
DATABASE_EXPORT	*PASSWORD_VERIFY_FUNCTION	The password complexity verification function
DATABASE_EXPORT	PROCEDURE	Procedures and their dependent grants and objects
DATABASE_EXPORT	PROFILE	Profiles
DATABASE_EXPORT	PROXY	Proxy authentications
DATABASE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the database
DATABASE_EXPORT	REFRESH_GROUP	Refresh groups
DATABASE_EXPORT	*RESOURCE_ COST	Resource cost information
DATABASE_EXPORT	RLS_CONTEXT	Fine-grained access-control driving contexts
DATABASE_EXPORT	RLS_GROUP	Fine-grained access-control policy groups
DATABASE_EXPORT	RLS_POLICY	Fine-grained access-control policies
DATABASE_EXPORT	ROLE	Roles
DATABASE_EXPORT	ROLE_GRANT	Role grants to users in the database
DATABASE_EXPORT	ROLLBACK_SEGMENT	Rollback segments
DATABASE_EXPORT	*SCHEMA (named object)	Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched.
DATABASE_EXPORT	SEQUENCE	Sequences
DATABASE_EXPORT	STATISTICS	Statistics on tables and indexes
DATABASE_EXPORT	SYNONYM	Public and private synonyms
DATABASE_EXPORT	SYSTEM_GRANT	System privilege grants

Table 57–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	TABLE	Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
DATABASE_EXPORT	TABLE_DATA	Row data for all tables
DATABASE_EXPORT	TABLESPACE	Tablespace definitions
DATABASE_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users in the database
DATABASE_EXPORT	TRIGGER	Triggers on the database, on schemas, and on schema objects
DATABASE_EXPORT	TRUSTED_DB_LINK	Trusted links
DATABASE_EXPORT	TYPE	Types (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	TYPE_BODY	Type bodies
DATABASE_EXPORT	TYPE_SPEC	Type specifications
DATABASE_EXPORT	USER	User definitions
DATABASE_EXPORT	VIEW	Views

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_FILTER was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_FILTER are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:
  - filter name not valid for the object type associated with the OPEN context
  - filter name not valid for the object_type_path
  - object_type_path not part of the collection designated by handle
  - filter value is the wrong datatype

SET_PARSE_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 57-9
> - Subprograms for Submitting XML to the Database on page 57-10

Syntax

The following syntax applies when SET_PARSE_ITEM is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
   handle       IN  NUMBER,
   name         IN  VARCHAR2,
   object_type  IN  VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET_PARSE_ITEM is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
   handle     IN NUMBER,
   name        IN VARCHAR2);
```

Parameters

Table 57–19 SET_PARSE_ITEM Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).
name	The name of the object attribute to be parsed and returned. See Table 57–20 for the attribute object type, name, and meaning.
object_type	Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: ▪ if object_type is omitted, the parse item applies to all object types within the heterogeneous collection ▪ if object_type is specified, the parse item only applies to that specific object type within the collection This parameter only applies when SET_PARSE_ITEM is used for object retrieval.

Table 57–20 describes the object type, name, and meaning of the items available in the SET_PARSE_ITEM procedure.

Table 57–20 SET_PARSE_ITEM: Parse Items

Object Type	Name	Meaning
All objects	VERB	If FETCH_XML_CLOB is called, no value is returned. If FETCH_DDL is called, then for every row in the sys.ku$_ddls nested table returned by FETCH_DDL the verb in the corresponding ddlText is returned. If the ddlText is a SQL DDL statement, then the SQL verb (for example, CREATE, GRANT, AUDIT) is returned. If the ddlText is a procedure call (for example, DBMS_AQADM.CREATE_QUEUE_TABLE()) then the package.procedure-name is returned.
All objects	OBJECT_TYPE	If FETCH_XML_CLOB is called, an object type name from Table 57–11 is returned. If FETCH_DDL is called and the ddlText is a SQL DDL statement whose verb is CREATE or ALTER, the object type as used in the DDL statement is returned (for example, TABLE, PACKAGE_BODY, and so on). Otherwise, an object type name from Table 57–11 is returned.
Schema objects	SCHEMA	The object schema is returned. If the object is not a schema object, no value is returned.
Named objects	NAME	The object name is returned. If the object is not a named object, no value is returned.
TABLE, TABLE_DATA, INDEX	TABLESPACE	The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a TABLE_DATA object, this is always the tablespace where the rows are stored.
TRIGGER	ENABLE	If the trigger is enabled, ENABLE is returned. If the trigger is disabled, DISABLE is returned.
OBJECT_GRANT, TABLESPACE_QUOTA	GRANTOR	The grantor is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_NAME	The name of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_SCHEMA	The schema of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_TYPE	The object type of the base object is returned. If the object is not a dependent object, no value is returned.
Granted objects	GRANTEE	The grantee is returned. If the object is not a granted object, no value is returned.

Usage Notes

These notes apply when using SET_PARSE_ITEM to retrieve objects.

By default, the FETCH_xxx routines return an object's metadata as XML or creation DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.

You can call SET_PARSE_ITEM multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the sys.ku$_parsed_items nested table.

For TABLE_DATA objects, the following parse item return values are of interest:

If Object Is	NAME, SCHEMA	BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA
nonpartitioned table	table name, schema	table name, schema
table partition	partition name, schema	table name, schema
nested table	storage table name, schema	name and schema of top-level table (*not* the parent nested table)

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA and BASE_OBJECT_TYPE parse items for secondary TABLE objects return the name, schema, and type of the domain index.

See Also:

- "FETCH_xxx Functions and Procedures" on page 57-18
- *Oracle Database Utilities* for information about using the Metadata API

By default, the CONVERT and PUT procedures simply transform an object's XML metadata to DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_PARSE_ITEM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_PARSE_ITEM are permitted.
- INCONSISTENT_ARGS. The attribute name is not valid for the object type associated with the OPEN context.

SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

These procedures are used for both retrieval and submission. SET_TRANSFORM_PARAM and SET_REMAP_PARAM specify parameters to the XSLT stylesheet identified by transform_handle. Use them to modify or customize the output of the transform.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 57-9
- Subprograms for Submitting XML to the Database on page 57-10

Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN VARCHAR2,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN BOOLEAN DEFAULT TRUE,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN NUMBER,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_REMAP_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   old_value          IN VARCHAR2,
   new_value          IN VARCHAR2,
   object_type        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 57–21 describes the parameters for the SET_TRANSFORM_PARAM and SET_REMAP_PARAM procedures.

Table 57–21 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
transform_handle	Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session. Note that the handle returned by OPEN is not a valid transform handle. For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.

Table 57–21 (Cont.) SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
name	The name of the parameter. Table 57–22 lists the transform parameters defined for the DDL transform, specifying the object_type it applies to, its datatype, and its meaning or effect. This includes its default value, if any, and whether the parameter is additive. Table 57–23 describes the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure. Table 57–24 describes the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.
value	The value of the transform. This parameter is valid only for SET_TRANSFORM_PARAM.
old_value	The old value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
new_value	The new value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
object_type	Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply: ▪ If object_type is omitted, the parameter applies to all applicable object types within the heterogeneous collection. ▪ If object_type is specified, the parameter only applies to that object type. This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.

Table 57–22 describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the SET_TRANSFORM_PARAM procedure.

Table 57–22 SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	PRETTY	BOOLEAN	If TRUE, format the output with indentation and line feeds. Defaults to TRUE.
All objects	SQLTERMINATOR	BOOLEAN	If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE.
TABLE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
TABLE	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	CONSTRAINTS	BOOLEAN	If TRUE, emit all non-referential table constraints. Defaults to TRUE.
TABLE	REF_CONSTRAINTS	BOOLEAN	If TRUE, emit all referential constraints (foreign keys). Defaults to TRUE.

Table 57–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
TABLE	CONSTRAINTS_AS_ALTER	BOOLEAN	If TRUE, emit table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.
TABLE	OID	BOOLEAN	If TRUE, emit the OID clause for object tables. Defaults to FALSE.
TABLE	SIZE_BYTE_KEYWORD	BOOLEAN	If TRUE, emit the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER, TABLESPACE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ ATTRIBUTES is FALSE.) Defaults to TRUE.
TYPE	SPECIFICATION	BOOLEAN	If TRUE, emit the type specification. Defaults to TRUE.
TYPE	BODY	BOOLEAN	If TRUE, emit the type body. Defaults to TRUE.
TYPE	OID	BOOLEAN	If TRUE, emit the OID clause. Defaults to FALSE.
PACKAGE	SPECIFICATION	BOOLEAN	If TRUE, emit the package specification. Defaults to TRUE.
PACKAGE	BODY	BOOLEAN	If TRUE, emit the package body. Defaults to TRUE.
VIEW	FORCE	BOOLEAN	If TRUE, use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE.
OUTLINE	INSERT	BOOLEAN	If TRUE, emit the INSERT statements into the OL$ dictionary tables that will create the outline and its hints. If FALSE, emit a CREATE OUTLINE statement. Defaults to FALSE. Note: This object type is being deprecated.
All objects	DEFAULT	BOOLEAN	Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default.

Table 57–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	INHERIT	BOOLEAN	If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle.
ROLE	REVOKE_FROM	Text	The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is emitted after the CREATE ROLE. Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant. Defaults to null string.
TABLESPACE	REUSE	BOOLEAN	If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. Defaults to FALSE.
CLUSTER, INDEX, ROLLBACK_SEGMENT, TABLE, TABLESPACE	PCTSPACE	NUMBER	A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundreths of the current allocation. For example, 100 means 100%. If the object type is TABLESPACE, the following size values are affected: - in file specifications, the value of SIZE - MINIMUM EXTENT - EXTENT MANAGEMENT LOCAL UNIFORM SIZE For other object types, INITIAL and NEXT are affected.

Table 57–23 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure.

Table 57–23 SET_TRANSFORM_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
All objects	OBJECT_ROW	NUMBER	A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document. This parameter is additive. By default, all objects are copied to the output document.

Table 57–24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.

Table 57–24 SET_REMAP_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
LIBRARY, TABLESPACE, DIRECTORY	REMAP_DATAFILE	Text	Objects in the document will have their filespecs renamed as follows: any filespec matching old_value will be changed to new_value. Filespecs should *not* be enclosed in quotes. This parameter is additive. By default, filespecs are not renamed.
Schema Objects, Dependent Objects, Granted Objects, USER	REMAP_SCHEMA	Text	Any schema object in the document whose name matches old_value will have its schema name changed to new_value. Any dependent object whose base object schema name matches old_value will have its base object schema name changed to new_value. Any granted object whose grantee name matches old_value will have its grantee name changed to new_value. Any user whose name matches old_value will have its name changed to new_value. This parameter is additive. By default, schemas are not remapped.
TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, TABLESPACE_QUOTA	REMAP_TABLESPACE	Text	Objects in the document will have their tablespaces renamed as follows: any tablespace name matching old_value will be changed to new_value. This parameter is additive. By default, tablespaces are not remapped.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. Either SET_TRANSFORM_PARAM or SET_REMAP_PARAM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_TRANSFORM_PARAM or SET_REMAP_PARAM are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. This can mean the following:
  - The transform parameter name is not valid for the object type associated with the OPEN context or for the transform associated with the transform handle.
  - The transform applies to all object types in a heterogeneous collection, but object_type is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call SET_TRANSFORM_PARAM or SET_REMAP_PARAM to specify the value of a parameter to be passed to the stylesheet identified by transform_handle.

Normally, if you call SET_TRANSFORM_PARAMETER multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the STORAGE transform parameter to TRUE.

```
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',false);
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the OBJECT_ROW parameter to the MODIFY transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',5);
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',8);
```

The REMAP_TABLESPACE parameter is also additive. If you specify the following, then tablespaces TBS1 and TBS3 are changed to TBS2 and TBS4, respectively.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS3','TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS2','TBS3');
```

> **Note:** The number of remap parameters that can be specified for a MODIFY transform is limited to ten. That is, you can specify up to ten REMAP_DATAFILE parameters, up to ten REMAP_SCHEMA parameters and so on. Additional instances are ignored. To work around this, you can perform another DBMS_METADATA.ADD_TRANSFORM and specify additional remap parameters.

The GET_DDL, GET_DEPENDENT_DDL, and GET_GRANTED_DDL functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant SESSION_TRANSFORM as the handle of the DDL transform at the session level. You can call SET_TRANSFORM_PARAM using DBMS_METADATA.SESSION_TRANSFORM as the transform handle to set transform parameters for the whole session. GET_DDL, GET_DEPENDENT_DDL, and GET GRANTED_DDL inherit these parameters when they invoke the DDL transform.

> **Note:** The enumerated constant must be prefixed with the package name DBMS_METADATA.SESSION_TRANSFORM.

58

DBMS_MGWADM

DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

Note: You must run the catmgw.sql script to load the Messaging Gateway packages and types into the database.

See Also: *Oracle Streams Advanced Queuing User's Guide and Reference* contains information on loading database objects and using DBMS_MGWADM

This chapter contains the following topics:

Using DBMS_MGWADM

Constants

Table 58–1 DBMS_MGWADM Constants—Cleanup Actions

Name	Type	Description
CLEAN_STARTUP_STATE	CONSTANT BINARY_INTEGER	Sets the Messaging Gateway agent to a known state so that it can be started
CLEAN_LOG_QUEUES	CONSTANT BINARY_INTEGER	Messaging Gateway agent will clean log queues for all configured messaging system links
RESET_SUB_MISSING_LOG_REC	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record
RESET_SUB_MISSING_MESSAGE	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message

Table 58–2 DBMS_MGWADM Constants—Force Values

Name	Type	Description
FORCE	CONSTANT BINARY_INTEGER	Represents a forced action
NO_FORCE	CONSTANT BINARY_INTEGER	Represents a normal, nonforced action

Table 58–3 DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
BASIC_LOGGING	CONSTANT BINARY_INTEGER	The standard (the least) information written to the log file
TRACE_DEBUG_LOGGING	CONSTANT BINARY_INTEGER	The greatest information written to the log file
TRACE_HIGH_LOGGING	CONSTANT BINARY_INTEGER	The third level of detail of logging information written to the log file
TRACE_LITE_LOGGING	CONSTANT BINARY_INTEGER	The second level detail of logging information written to the log file

Table 58–4 DBMS_MGWADM Constants—Named Property Constants

Name	Type	Description
MGWPROP_PREFIX	CONSTANT VARCHAR2	A constant (MGWPROP$_) for the reserved property name prefix
MGWPROP_REMOVE	CONSTANT VARCHAR2	A constant (MGWPROP$_REMOVE) for the reserved property name used to remove an existing property
MGWPROP_REMOVE_ALL	CONSTANT VARCHAR2	A constant (MGWPROP$_REMOVE_ALL) for the reserved property name used to remove all properties

Table 58–5 DBMS_MGWADM Constants—Other Constants

Name	Type	Description
JMS_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model
JMS_QUEUE_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS queue connections will be used to access JMS destinations
JMS_TOPIC_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS topic connections will be used to access JMS destinations
NO_CHANGE	CONSTANT VARCHAR2	Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged.

Table 58–6 DBMS_MGWADM Constants—Propagation Types

Name	Type	Description
INBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for non-Oracle to Oracle Streams AQ propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Streams AQ queue.
OUTBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for Oracle Streams AQ to non-Oracle propagation. The propagation source is a local Oracle Streams AQ queue and the destination is a queue in a foreign (non-Oracle) messaging system.

Table 58–7 DBMS_MGWADM Constants—Queue Domain Types

Name	Type	Description
DOMAIN_QUEUE	CONSTANT BINARY_INTEGER	Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue.
DOMAIN_TOPIC	CONSTANT BINARY_INTEGER	Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic.

Table 58–8 DBMS_MGWADM Constants—Shutdown Modes

Name	Type	Description
SHUTDOWN_IMMEDIATE	CONSTANT BINARY_INTEGER	Represents the immediate shutdown mode
SHUTDOWN_NORMAL	CONSTANT BINARY_INTEGER	Represents the normal shutdown mode

Table 58–9 DBMS_MGWADM Constants—WebSphere MQ Interface Types

Name	Type	Description
MQSERIES_BASE_JAVA_INTERFACE	CONSTANT BINARY_INTEGER	Represents the Base Java interface for the WebSphere MQ messaging system

Views

The views listed in Table 58–10 provide Messaging Gateway configuration, status, and statistical information. Unless otherwise indicated, the SELECT privilege is granted to MGW_ADMINISTRATOR_ROLE so that only Messaging Gateway administrators have access to the views. All views are owned by SYS.

Table 58–10 Database Views

Name	Description
MGW_GATEWAY View	Configuration and status information for Messaging Gateway
MGW_LINKS View	Names and types of messaging system links currently created
MGW_MQSERIES_LINKS View	Messaging system properties for WebSphere MQ links
MGW_TIBRV_LINKS View	Messaging system properties for TIB/Rendezvous links
MGW_FOREIGN_QUEUES View	Queue properties of registered queues
MGW_SUBSCRIBERS View	Subscriber properties, status, and statistical information
MGW_SCHEDULES View	Schedule properties and status

MGW_GATEWAY View

This view lists configuration and status information for Messaging Gateway, as shown in Table 58–11.

Table 58–11 MGW_GATEWAY View Properties

Name	Type	Description
AGENT_DATABASE	VARCHAR2	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection is used.
AGENT_INSTANCE	NUMBER	The database instance on which the Messaging Gateway agent is currently running. This should be NULL if the agent is not running.
AGENT_JOB	NUMBER	Job number of the queued job used to start the Messaging Gateway agent process. The job number is set when Messaging Gateway is started and cleared when it shuts down.
AGENT_PING	VARCHAR2	Gateway agent ping status. Values: ■ NULL means no ping attempt was made. ■ REACHABLE means ping attempt was successful. ■ UNREACHABLE means ping attempt failed. AGENT_PING attempts to contact the Messaging Gateway agent. There is a short delay (up to 5 seconds) if the ping attempt fails. No ping is attempted if the AGENT_STATUS is NOT_STARTED or START_SCHEDULED.
AGENT_START_TIME	TIMESTAMP	The time when the Messaging Gateway agent job currently running was started. This should be NULL if the agent is not running.

Table 58–11 (Cont.) MGW_GATEWAY View Properties

Name	Type	Description
AGENT_STATUS	VARCHAR2	Status of the Messaging Gateway agent. Values: ■ NOT_STARTED means the Messaging Gateway agent has not been started ■ START_SCHEDULED means Messaging Gateway agent has been scheduled to start. That is, Messaging Gateway has been started using DBMS_MGWADM.STARTUP, but the queued job used to start the Messaging Gateway agent has not yet run. ■ STARTING means Messaging Gateway agent is starting. That is, Messaging Gateway has been started using DBMS_MGWADM.STARTUP, the queued job has run, and the Messaging Gateway agent is starting up. ■ INITIALIZING means the Messaging Gateway agent has started and is initializing ■ RUNNING means the Messaging Gateway agent is running ■ SHUTTING_DOWN means the Messaging Gateway agent is shutting down ■ BROKEN means an unexpected condition has been encountered that prevents the Messaging Gateway agent from starting. DBMS_MGWADM.CLEANUP_GATEWAY must be called before the agent can be started.
AGENT_USER	VARCHAR2	Database username used by the Messaging Gateway agent to connect to the database
LAST_ERROR_DATE	DATE	Date of last Messaging Gateway agent error. The last error information is cleared when Messaging Gateway is started. It is set if the Messaging Gateway agent fails to start or terminates due to an abnormal condition.
LAST_ERROR_MSG	VARCHAR2	Message for last Messaging Gateway agent error
LAST_ERROR_TIME	VARCHAR2	Time of last Messaging Gateway agent error
MAX_CONNECTIONS	NUMBER	Maximum number of messaging connections to Oracle Database
MAX_MEMORY	NUMBER	Maximum heap size used by the Messaging Gateway agent (in MB)
MAX_THREADS	NUMBER	Maximum number of messaging threads created by the Messaging Gateway agent

MGW_LINKS View

This view lists the names and types of messaging system links currently defined. Table 58–12 lists the MGW_LINKS view properties.

Table 58–12 MGW_LINKS View Properties

Name	Type	Description
LINK_COMMENT	VARCHAR2	User comment for the link
LINK_NAME	VARCHAR2	Name of the messaging system link
LINK_TYPE	VARCHAR2	Type of messaging system link. Values ■ MQSERIES is for WebSphere MQ links. ■ TIBRV is for TIB/Rendezvous links.

MGW_MQSERIES_LINKS View

This view lists information for the WebSphere MQ messaging system links. The view includes most of the messaging system properties specified when the link is created. Table 58–13 lists the MGW_MQSERIES_LINKS view properties.

Table 58–13 MGW_MQSERIES_LINKS View Properties

Name	Type	Description
CHANNEL	VARCHAR2	Connection channel
HOSTNAME	VARCHAR2	Name of the WebSphere MQ host
INBOUND_LOG_QUEUE	VARCHAR2	Inbound propagation log queue
INTERFACE_TYPE	VARCHAR2	Messaging interface type. Values: ■ BASE_JAVA is for WebSphere MQ Base Java interface ■ JMS_CONNECTION is for WebSphere MQ JMS unified, domain-independent connections ■ JMS_QUEUE_CONNECTION is for WebSphere MQ JMS queue connections ■ JMS_TOPIC_CONNECTION is for WebSphere MQ JMS topic connections
LINK_COMMENT	VARCHAR2	User comment for the link
LINK_NAME	VARCHAR2	Name of the messaging system link
MAX_CONNECTIONS	NUMBER	Maximum number of messaging connections
OPTIONS	SYS.MGW_ PROPERTIES	Link options
OUTBOUND_LOG_QUEUE	VARCHAR2	Outbound propagation log queue
PORT	NUMBER	Port number
QUEUE_MANAGER	VARCHAR2	Name of the WebSphere MQ queue manager

MGW_TIBRV_LINKS View

This view lists information for TIB/Rendezvous messaging system links. The view includes most of the messaging system properties specified when the link was created. Table 58–14 lists the MGW_TIBRV_LINKS view properties.

Table 58–14 MGW_TIBRV_LINKS View Properties

Property Name	Type	Description
CM_LEDGER	VARCHAR2	TIB/Rendezvous CM ledger file name
CM_NAME	VARCHAR2	TIB/Rendezvous CM correspondent name
DAEMON	VARCHAR2	TIB/Rendezvous daemon parameter for rvd transport
LINK_COMMENT	VARCHAR2	User comment for the link
LINK_NAME	VARCHAR2	Name of the messaging system link
NETWORK	VARCHAR2	TIB/Rendezvous network parameter for rvd transport
OPTIONS	SYS.MGW_ PROPERTIES	Link options
SERVICE	VARCHAR2	TIB/Rendezvous service parameter for rvd transport

MGW_FOREIGN_QUEUES View

This view lists information for foreign queues. The view includes most of the queue properties specified when the queue is registered. Table 58–15 lists the MGW_FOREIGN_QUEUES view properties.

Table 58–15 MGW_FOREIGN_QUEUES View Properties

Name	Type	Description
DOMAIN	VARCHAR2	Queue domain type. Values: ■ NULL means the queue domain type is automatically determined by the messaging system ■ QUEUE is for a queue (point-to-point) model ■ TOPIC is for a topic (publish-subscribe) model
LINK_NAME	VARCHAR2	Name of the messaging system link
NAME	VARCHAR2	Name of the registered queue
OPTIONS	SYS.MGW_PROPERTIES	Optional queue properties
PROVIDER_QUEUE	VARCHAR2	Message provider (native) queue name
QUEUE_COMMENT	VARCHAR2	User comment for the foreign queue

MGW_SUBSCRIBERS View

This view lists configuration and status information for Messaging Gateway subscribers. The view includes most of the subscriber properties specified when the subscriber is added, as well as other status and statistical information. Table 58–16 lists the MGW_SUBSCRIBERS view properties.

Table 58–16 MGW_SUBSCRIBERS View Properties

Name	Type	Description
DESTINATION	VARCHAR2	Destination queue to which messages are propagated
EXCEPTIONQ_MSGS	NUMBER	Number of messages moved to the propagation exception queue since the last time the agent was started
EXCEPTION_QUEUE	VARCHAR2	Exception queue used for logging purposes
FAILURES	NUMBER	Number of propagation failures
LAST_ERROR_DATE	DATE	Date of last propagation error
LAST_ERROR_MSG	VARCHAR2	Message for last propagation error
LAST_ERROR_TIME	VARCHAR2	Time of last propagation error
OPTIONS	SYS.MGW_PROPERTIES	Subscriber options
PROP_STYLE	VARCHAR2	Message propagation style. Values: ■ NATIVE is for native message propagation ■ JMS is for JMS message propagation
PROPAGATED_MSGS	NUMBER	Number of messages propagated to the destination queue since the last time the agent was started

Table 58–16 (Cont.) MGW_SUBSCRIBERS View Properties

Name	Type	Description
PROPAGATION_TYPE	VARCHAR2	Propagation type. Values: ■ OUTBOUND is for Oracle Streams AQ to non-Oracle propagation ■ INBOUND is for non-Oracle to Oracle Streams AQ propagation
QUEUE_NAME	VARCHAR2	Subscriber source queue
RULE	VARCHAR2	Subscription rule
STATUS	VARCHAR2	Subscriber status. Values: ■ ENABLED means the subscriber is enabled ■ DELETE_PENDING means subscriber removal is pending, usually because DBMS_MGWADM.REMOVE_SUBSCRIBER has been called but certain cleanup tasks pertaining to this subscriber are still outstanding
SUBSCRIBER_ID	VARCHAR2	Propagation subscriber identifier
TRANSFORMATION	VARCHAR2	Transformation used for message conversion

MGW_SCHEDULES View

This view lists configuration and status information for Messaging Gateway schedules. The view includes most of the schedule properties specified when the schedule is created, as well as other status information. Table 58–17 lists the MGW_SCHEDULES view properties.

Table 58–17 MGW_SCHEDULES View Properties

Name	Type	Description
DESTINATION	VARCHAR2	Propagation destination
LATENCY	NUMBER	Propagation window latency (in seconds)
NEXT_TIME	VARCHAR2	Reserved for future use
PROPAGATION_TYPE	VARCHAR2	Propagation type. Values: ■ OUTBOUND is for Oracle Streams AQ to non-Oracle propagation ■ INBOUND is for non-Oracle to Oracle Streams AQ propagation
PROPAGATION_WINDOW	NUMBER	Reserved for future use
SCHEDULE_DISABLED	VARCHAR2	Indicates whether the schedule is disabled. Y means the schedule is disabled. N means the schedule is enabled.
SCHEDULE_ID	VARCHAR2	Propagation schedule identifier
SOURCE	VARCHAR2	Propagation source
START_DATE	DATE	Reserved for future use
START_TIME	VARCHAR2	Reserved for future use

Data Structures

The DBMS_MGWADM package defines the following OBJECT types.

Object Types

- SYS.MGW_MQSERIES_PROPERTIES Object Type
- SYS.MGW_PROPERTIES Object Type
- SYS.MGW_PROPERTY Object Type
- SYS.MGW_TIBRV_PROPERTIES Object Type

SYS.MGW_MQSERIES_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

Syntax

```
TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
   queue_manager       VARCHAR2(64),
   hostname            VARCHAR2(64),
   port                INTEGER,
   channel             VARCHAR2(64),
   interface_type      INTEGER,
   max_connections     INTEGER,
   username            VARCHAR2(64),
   password            VARCHAR2(64),
   inbound_log_queue   VARCHAR2(64),
   outbound_log_queue  VARCHAR2(64),

-- Methods
STATIC FUNCTION construct
RETURN SYS.MGW_MQSERIES_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_MQSERIES_PROPERTIES );
```

Attributes

Table 58–18 SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
queue_manager	The name of the WebSphere MQ queue manager
hostname	The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.
port	The port number. This is used only for client connections; that is, when hostname is not NULL.
channel	The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.
interface_type	The type of messaging interface to use. Values: ■ DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used. ■ DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner. ■ DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues ■ DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics.
max_connections	The maximum number of messaging connections to the WebSphere MQ messaging system
username	The username used for authentication to the WebSphere MQ messaging system

Table 58–18 (Cont.) SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
password	The password used for authentication to the WebSphere MQ messaging system
inbound_log_queue	The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source: ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.
outbound_log_queue	The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination: ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.

Methods

Table 58–19 SYS.MGW_MQSERIES_PROPERTIES Methods

Method	Description
construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL
alter_construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 data type are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other data types are assigned a value of NULL.

SYS.MGW_PROPERTIES Object Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

Attributes

Table 58–20 SYS.MGW_PROPERTIES Attributes

Attribute	Description
`name`	Property name
`value`	Property value

Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the `MGWPROP$_` prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

  ```
  MGW_PROPERTY.NAME = property_name
  MGW_PROPERTY.VALUE = property_value
  ```

  If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
  MGW_PROPERTY.VALUE = name_of_property_to_remove
  ```

  No action is taken if the property name does not exist in the original list.

- Remove all properties

  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
  MGW_PROPERTY.VALUE = not used
  ```

See Also: "The DBMS_MGWADM package defines constants to represent the reserved property names on Table 58–4, " DBMS_MGWADM Constants—Named Property Constants"

SYS.MGW_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
   name  VARCHAR2(500),
   value VARCHAR2(4000),

-- Methods
STATIC FUNCTION construct    --- (1)
RETURN SYS.MGW_PROPERTY,

STATIC FUNCTION construct(   --- (2)
   p_name   IN VARCHAR2,
   p_value  IN VARCHAR2)
RETURN SYS.MGW_PROPERTY );
```

Attributes

Table 58–21 SYS.MGW_PROPERTY Attributes

Attribute	Description
`name`	Property name
`value`	Property value

Methods

Table 58–22 SYS.MGW_PROPERTY Methods

Method	Description
`construct --- (1)`	Constructs a new `MGW_PROPERTY` instance. All attributes are assigned a value of `NULL`
`construct --- (2)`	Constructs a new `MGW_PROPERTY` instance initialized using the given parameters

SYS.MGW_TIBRV_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

Syntax

```
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
   service   VARCHAR2(128),
   daemon    VARCHAR2(128),
   network   VARCHAR2(256),
   cm_name   VARCHAR2(256),
   cm_ledger VARCHAR2(256),

-- Methods
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_TIBRV_PROPERTIES );
```

Attributes

Table 58–23 SYS.MGW_TIBRV_PROPERTIES Attributes

Attribute	Description
`service`	The service parameter for the rvd transport
`daemon`	The daemon parameter for the rvd transport
`network`	The network parameter for the rvd transport
`cm_name`	The CM correspondent name. Reserved for future use.
`cm_ledger`	The CM ledger file name. Reserved for future use.

Methods

Table 58–24 SYS.MGW_TIBRV_PROPERTIES Methods

Method	Description
`construct`	Constructs a new `SYS.MGW_TIBRV_PROPERTIES` instance. All attributes will be assigned a value of `NULL`.
`alter_construct`	Constructs a new `SYS.MGW_TIBRV_PROPERTIES` instance. This function is useful for altering the properties of an existing messaging link. All attributes having a `VARCHAR2` data type will be assigned a value of `DBMS_MGWADM.NO_CHANGE`. Attributes of other data types will be assigned a value of `NULL`.

Summary of DBMS_MGWADM Subprograms

Table 58–25 DBMS_MGWADM Package Subprograms

Subprogram	Description
ADD_SUBSCRIBER Procedure on page 58-20	Adds a subscriber used to consume messages from a source queue for propagation to a destination
ALTER_AGENT Procedure on page 58-23	Alters Messaging Gateway agent parameters
ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous on page 58-24	Alters the properties of a TIB/Rendezvous messaging system link
ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ on page 58-25	Alters the properties of a WebSphere MQ messaging system link
ALTER_PROPAGATION_ SCHEDULE Procedure on page 58-26	Alters a propagation schedule
ALTER_SUBSCRIBER Procedure on page 58-27	Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination
CLEANUP_GATEWAY Procedure on page 58-29	Cleans up Messaging Gateway
CREATE_MSGSYSTEM_LINK Procedure for TIB/Rendezvous on page 58-32	Creates a messaging system link to a TIB/Rendezvous messaging system
CREATE_MSGSYSTEM_LINK Procedure for WebSphere MQ on page 58-33	Creates a messaging system link to a WebSphere MQ messaging system
DB_CONNECT_INFO Procedure on page 58-34	Configures connection information used by the Messaging Gateway agent for connections to Oracle Database
DISABLE_PROPAGATION_ SCHEDULE Procedure on page 58-35	Disables a propagation schedule
ENABLE_PROPAGATION_ SCHEDULE Procedure on page 58-36	Enables a propagation schedule
REGISTER_FOREIGN_QUEUE Procedure on page 58-37	Registers a non-Oracle queue entity in Messaging Gateway
REMOVE_MSGSYSTEM_LINK Procedure on page 58-38	Removes a messaging system link for a non-Oracle messaging system
REMOVE_SUBSCRIBER Procedure on page 58-39	Removes a subscriber used to consume messages from a source queue for propagation to a destination
RESET_SUBSCRIBER Procedure on page 58-40	Resets the propagation error state for a subscriber
SCHEDULE_PROPAGATION Procedure on page 58-41	Schedules message propagation from a source to a destination
SET_LOG_LEVEL Procedure on page 58-43	Dynamically alters the Messaging Gateway agent logging level

Table 58–25 (Cont.) DBMS_MGWADM Package Subprograms

Subprogram	Description
SHUTDOWN Procedure on page 58-44	Shuts down the Messaging Gateway agent
STARTUP Procedure on page 58-45	Starts the Messaging Gateway agent
UNREGISTER_FOREIGN_QUEUE Procedure on page 58-46	Removes a non-Oracle queue entity in Messaging Gateway
UNSCHEDULE_PROPAGATION Procedure on page 58-47	Removes a propagation schedule

ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER(
   subscriber_id     IN VARCHAR2,
   propagation_type  IN BINARY_INTEGER,
   queue_name        IN VARCHAR2,
   destination       IN VARCHAR2,
   rule              IN VARCHAR2 DEFAULT NULL,
   transformation    IN VARCHAR2 DEFAULT NULL,
   exception_queue   IN VARCHAR2 DEFAULT NULL
   options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

Parameters

Table 58–26 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Specifies a user-defined name that identifies this subscriber
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation
queue_name	Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If NULL, then the Oracle Streams AQ payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.

Usage Notes

> **See Also:** "Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `NULL`.

> **See Also:** For additional information regarding subscriber options
>
> - "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference*
> - "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference*

OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- `queue_name` specifies the local Oracle Streams AQ queue that is the propagation source. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `rule` specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Streams AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If `NULL`, then no rule or selector is used.
- `transformation` specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway.

  Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.
- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Streams AQ interface is used, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_`*`subscriber_id`*`',NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_`*`subscriber_id`*. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Streams AQ queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type.

  Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.
- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

ALTER_AGENT Procedure

This procedure configures Messaging Gateway agent parameters.

Syntax

```
DBMS_MGWADM.ALTER_AGENT (
   max_connections  IN BINARY_INTEGER DEFAULT NULL,
   max_memory       IN BINARY_INTEGER DEFAULT NULL,
   max_threads      IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 58–27 ALTER_AGENT Procedure Parameters

Parameter	Description
max_connections	The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.
max_memory	The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.
max_threads	The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged.

Usage Notes

Default values for these configuration parameters are set when the Messaging Gateway agent is installed.

Changes to the max_memory and max_threads parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.

ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Alters the properties of a TIB/Rendezvous messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
   linkname      IN  VARCHAR2,
   properties    IN  SYS.MGW_TIBRV_PROPERTIES,
   options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 58–28 ALTER_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameters	Description
`linkname`	The messaging system link name
`properties`	Basic properties for a TIB/Rendezvous messaging system link. If `NULL`, then no link properties will be changed.
`options`	Optional link properties. If `NULL`, then no options will be changed. If not `NULL`, then the properties specified in this list are combined with the current options properties to form a new set of link options.
`comment`	A user-specified description, or `NULL` if one is not desired. If `DBMS_MGWADM.NO_CHANGE`, then the current value will not be changed.

Usage Notes

To retain an existing value for a messaging link property with a `VARCHAR2` data type, specify `DBMS_MGWADM.NO_CHANGE` for that particular property. To preserve an existing value for a property of another data type, specify `NULL` for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: SYS.MGW_PROPERTIES Object Type on page 58-14

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
   linkname   IN  VARCHAR2,
   properties IN  SYS.MGW_MQSERIES_PROPERTIES,
   options    IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment    IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

Parameters

Table 58–29 ALTER_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameters	Description
`linkname`	The messaging system link name
`properties`	Basic properties for a WebSphere MQ messaging system link. If it is `NULL`, then no link properties are changed.
`options`	Optional link properties. `NULL` if no options are changed. If not `NULL`, then the properties specified in this list are combined with the current options properties to form a new set of link options.
`comment`	An optional description or `NULL` if not desired. If `DBMS_MGWADM.NO_CHANGE` is specified, then the current value is not changed.

Usage Notes

To retain an existing value for a messaging link property with a `VARCHAR2` data type, specify `DBMS_MGWADM.NO_CHANGE` for that particular property. To preserve an existing value for a property of another data type, specify `NULL` for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: SYS.MGW_PROPERTIES Object Type on page 58-14

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2,
   duration     IN NUMBER DEFAULT NULL,
   next_time    IN VARCHAR2 DEFAULT NULL,
   latency      IN NUMBER DEFAULT NULL);
```

Parameters

Table 58–30 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
`schedule_id`	Identifies the propagation schedule to be altered
`duration`	Reserved for future use
`next_time`	Reserved for future use
`latency`	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: `NULL` or value > 0. If `latency` is `NULL`, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
   subscriber_id    IN VARCHAR2,
   rule             IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   transformation   IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   exception_queue  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   options          IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

Parameters

Table 58–31 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be altered
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.

Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ

interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

CLEANUP_GATEWAY Procedure

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The MGW_GATEWAY view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY(
   action  IN BINARY_INTEGER,
   sarg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–32 CLEANUP_GATEWAY Procedure Parameters

Parameter	Description
action	The cleanup action to be performed. Values: ■ DBMS_MGWADM.CLEAN_STARTUP_STATE for Messaging Gateway start up state recovery. ■ DBMS_MGWADM.CLEAN_LOG_QUEUES for log queue cleanup. ■ DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC for subscriber recovery due to missing log record. ■ DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE for subscriber recovery due to missing message.
sarg	Optional argument whose meaning depends on the value specified for action. This should be NULL if it is not used for the specified action.

Usage Notes

CLEAN_STARTUP_STATE

sarg is not used and must be NULL.

The CLEAN_STARTUP_STATE action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The CLEAN_STARTUP_STATE action may be needed when the MGW_GATEWAY view shows that the AGENT_STATUS value is something other than NOT_STARTED or START_SCHEDULED, and the AGENT_PING value is UNREACHABLE for an extended period of time.

If the AGENT_STATUS value is BROKEN, then the Messaging Gateway agent cannot be started until the problem has been resolved and the CLEAN_STARTUP_STATE action used to reset the agent status. A BROKEN status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the queued job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to NOT_STARTED.

Execution of this command fails if:

- The agent status is NOT_STARTED or START_SCHEDULED.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is STARTING.
- The Messaging Gateway agent is successfully contacted.

  The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

> **Note:** Terminate any Messaging Gateway agent process that may still be running after a CLEAN_STARTUP_STATE action has been successfully performed. This should be done before calling DBMS_MGWADM.STARTUP to start Messaging Gateway. The process is usually named extprocmgwextproc.

CLEAN_LOG_QUEUES

sarg is not used and must be NULL.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

> **Note:** For Oracle Database 10*g*, the CLEAN_LOG_QUEUES action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

RESET_SUB_MISSING_LOG_REC

sarg specifies a Messaging Gateway subscriber ID to be reset. It must be not NULL.

The Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

> **Caution:** If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

RESET_SUB_MISSING_MESSAGE

sarg specifies a Messaging Gateway subscriber ID to be reset. It must be not NULL.

The Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that subscriber. The procedure will fail if the Messaging Gateway agent is not running.

CREATE_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Creates a link to a TIB/Rendezvous messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
   linkname     IN  VARCHAR2,
   properties   IN  SYS.MGW_TIBRV_PROPERTIES,
   options      IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment      IN  VARCHAR2 DEFAULT NULL );
```

Parameters

Table 58–33 CREATE_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameter	Description
`linkname`	A user-defined name to identify this messaging system link
`properties`	Basic properties of a TIB/Rendezvous messaging system link.
`options`	Optional link properties. `NULL` if there are none. These are less frequently used configuration properties supported by the messaging system
`comment`	A user-specified description. `NULL` if one is not desired.

Usage Notes

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

CREATE_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
   linkname    IN VARCHAR2,
   properties  IN SYS.MGW_MQSERIES_PROPERTIES,
   options     IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–34 CREATE_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameter	Description
`linkname`	A user-defined name to identify the messaging system link
`properties`	Basic properties of a WebSphere MQ messaging system link
`options`	Optional link properties. `NULL` if there are none. These are less frequently used configuration properties supported by the messaging system.
`comment`	A user-specified description. `NULL` if one is not desired

Usage Notes

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference* for more information about the messaging system properties and options

DB_CONNECT_INFO Procedure

This procedure configures connection information used by the Messaging Gateway agent for connections to Oracle Database.

Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
   username      IN VARCHAR2,
   password      IN VARCHAR2,
   database      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–35 DB_CONNECT_INFO Procedure Parameters

Parameter	Description
username	The username used for connections to Oracle Database. NULL is not allowed
password	The password used for connections to Oracle Database. NULL is not allowed
database	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from tnsnames.ora.

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role MGW_AGENT_ROLE, and then call this procedure to configure Messaging Gateway. Role MGW_AGENT_ROLE is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Streams AQ queues, and perform certain Oracle Streams AQ administration tasks.

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2 );
```

Parameters

Table 58–36 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be disabled

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a propagation schedule.

Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2 );
```

Parameters

Table 58–37 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be enabled

REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE(
   name            IN VARCHAR2,
   linkname        IN VARCHAR2,
   provider_queue  IN VARCHAR2 DEFAULT NULL,
   domain          IN INTEGER DEFAULT NULL,
   options         IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 58–38 REGISTER_FOREIGN_QUEUE Procedure Parameters

Parameters	Description
`name`	The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.
`linkname`	The link name for the messaging system on which this queue exists
`provider_queue`	The message provider (native) queue name. If `NULL`, then the value provided for the `name` parameter is used as the provider queue name.
`domain`	The domain type of the queue. `NULL` means the domain type is automatically determined based on the messaging system of the queue. `DBMS_MGWADM.DOMAIN_QUEUE` is for a queue (point-to-point model). `DBMS_MGWADM.DOMAIN_TOPIC` is for a topic (publish-subscribe model)
`options`	Optional queue properties
`comment`	A user-specified description. Can be `NULL`.

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

> **See Also:** For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Streams Advanced Queuing User's Guide and Reference*.

REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(
   linkname  IN VARCHAR2);
```

Parameters

Table 58–39 REMOVE_MSGSYSTEM_LINK Procedure Parameters

Parameters	Description
`linkname`	The messaging system link name

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

REMOVE_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (
   subscriber_id  IN VARCHAR2,
   force          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

Parameters

Table 58–40 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be removed
force	Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber. DBMS_MGWADM.NO_FORCE (0) means the subscriber is not removed if Messaging Gateway is unable to clean up successfully. DBMS_MGWADM.FORCE (1) means the subscriber is removed, even though all cleanup actions may not be done. The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.

Usage Notes

For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue.

RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (
   subscriber_id  IN VARCHAR2 );
```

Parameters

Table 58–41 RESET_SUBSCRIBER Procedure Parameters

Parameter	Description
`subscriber_id`	Identifies the subscriber

SCHEDULE_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination. The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
   schedule_id       IN VARCHAR2,
   propagation_type  IN BINARY_INTEGER,
   source            IN VARCHAR2,
   destination       IN VARCHAR2,
   start_time        IN DATE DEFAULT SYSDATE,
   duration          IN NUMBER DEFAULT NULL,
   next_time         IN VARCHAR2 DEFAULT NULL,
   latency           IN NUMBER DEFAULT NULL);
```

Parameters

Table 58–42 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Specifies a user-defined name that identifies the schedule
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation.
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
start_time	Reserved for future use
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

For outbound propagation, parameters are interpreted as follows:

- source specifies the local Oracle Streams AQ queue from which messages are propagated. This must have a syntax of schema.queue.

- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

SET_LOG_LEVEL Procedure

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (
   log_level  IN BINARY_INTEGER);
```

Parameters

Table 58–43 SET_LOG_LEVEL Procedure Parameters

Parameter	Description
`log_level`	Level at which the Messaging Gateway agent logs information. `DBMS_MGWADM.BASIC_LOGGING` generates the least information while `DBMS_MGWADM.TRACE_DEBUG_LOGGING` generates the most information.

See Also: Table 58–3, " DBMS_MGWADM Constants—Logging Levels" on page 58-3 for details on the `log_level` parameter

SHUTDOWN Procedure

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (
   sdmode  IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

Parameters

Table 58–44 SHUTDOWN Procedure Parameters

Parameter	Description
sdmode	The shutdown mode. The only value currently supported is DBMS_MGWADM.SHUTDOWN_NORMAL for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.

STARTUP Procedure

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP(
   instance  IN  BINARY_INTEGER DEFAULT 0,
   force     IN  BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

Parameters

Table 58–45 STARTUP Procedure Parameters

Parameter	Description
`instance`	Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance.
`force`	If this is `DBMS_MGWADM.FORCE`, then any positive integer is acceptable as the job instance. If this is `DBMS_MGWADM.NO_FORCE` (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

The Messaging Gateway agent cannot be started until an agent user has been configured using `DBMS_MGWADM.DB_CONNECT_INFO`.

This procedure submits a job queue job, which starts the Messaging Gateway agent when it runs. The `instance` and `force` parameters are used for job queue affinity, which you use to indicate whether a particular instance or any instance can run a submitted job.

UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE(
   name         IN VARCHAR2,
   linkname     IN VARCHAR2);
```

Parameters

Table 58–46 UNREGISTER_FOREIGN_QUEUE Procedure Parameters

Parameter	Description
`name`	The queue name
`linkname`	The link name for the messaging system on which the queue exists

Usage Notes

This procedure does not remove the physical queue in the non-Oracle messaging system.

All subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a subscriber or propagation schedule references the non-Oracle queue.

UNSCHEDULE_PROPAGATION Procedure

This procedure removes a propagation schedule.

Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (
   schedule_id   IN VARCHAR2 );
```

Parameters

Table 58–47 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be removed

59

DBMS_MGWMSG

DBMS_MGWMSG provides:

- Object types used by the canonical message types to convert message bodies.
- Methods, constants, and subprograms for working with Messaging Gateway message types.

> **See Also:** Chapter 58, "DBMS_MGWADM" which describes the Messaging Gateway administrative interface, DBMS_MGWADM

This chapter contains the following topics:

Using DBMS_MGWMSG

Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS_MGWMSG package as well as the canonical types. The DBMS_MGWMSG packages and object types are owned by SYS.

Note: You must run the catmgw.sql script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Streams Advanced Queuing User's Guide and Reference* for information on loading database objects and using DBMS_MGWMSG.

Constants

Table 59–1 DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

Value	Constant
TEXT_VALUE	CONSTANT BINARY_INTEGER := 1
RAW_VALUE	CONSTANT BINARY_INTEGER := 2
BOOLEAN_VALUE	CONSTANT BINARY_INTEGER := 3
BYTE_VALUE	CONSTANT BINARY_INTEGER := 4
SHORT_VALUE	CONSTANT BINARY_INTEGER := 5
INTEGER_VALUE	CONSTANT BINARY_INTEGER := 6
LONG_VALUE	CONSTANT BINARY_INTEGER := 7
FLOAT_VALUE	CONSTANT BINARY_INTEGER := 8
DOUBLE_VALUE	CONSTANT BINARY_INTEGER := 9
DATE_VALUE	CONSTANT BINARY_INTEGER := 10

Table 59–2 DBMS_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value

Value	Constant
BOOLEAN_FALSE	CONSTANT BINARY_INTEGER := 0
BOOLEAN_TRUE	CONSTANT BINARY_INTEGER := 1

Table 59–3 DBMS_MGWMSG Constants: Case Comparisons

Value	Constant
CASE_SENSITIVE	CONSTANT BINARY_INTEGER := 0
CASE_INSENSITIVE	CONSTANT BINARY_INTEGER := 1

Table 59–4 Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_BOOL	CONSTANT INTEGER := 1
TIBRVMSG_F32	CONSTANT INTEGER := 2
TIBRVMSG_F64	CONSTANT INTEGER := 3
TIBRVMSG_I8	CONSTANT INTEGER := 4
TIBRVMSG_I16	CONSTANT INTEGER := 5
TIBRVMSG_I32	CONSTANT INTEGER := 6
TIBRVMSG_I64	CONSTANT INTEGER := 7
TIBRVMSG_IPADDR32	CONSTANT INTEGER := 8
TIBRVMSG_IPPORT16	CONSTANT INTEGER := 9
TIBRVMSG_DATETIME	CONSTANT INTEGER := 10
TIBRVMSG_F32ARRAY	CONSTANT INTEGER := 11

Table 59–4 (Cont.) Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_F64ARRAY	CONSTANT INTEGER := 12
TIBRVMSG_I8ARRAY	CONSTANT INTEGER := 13
TIBRVMSG_I16ARRAY	CONSTANT INTEGER := 14
TIBRVMSG_I32ARRAY	CONSTANT INTEGER := 15
TIBRVMSG_I64ARRAY	CONSTANT INTEGER := 16
TIBRVMSG_OPAQUE	CONSTANT INTEGER := 17
TIBRVMSG_STRING	CONSTANT INTEGER := 18
TIBRVMSG_XML	CONSTANT INTEGER := 19

Types

SYS.MGW_NAME_VALUE_T Type

This type specifies a named value. The `name` attribute, `type` attribute, and one of the `<>_value` attributes are typically not `NULL`.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
   name               VARCHAR2(250),
   type               INTEGER,
   integer_value      INTEGER,
   number_value       NUMBER,
   text_value         VARCHAR2(4000),
   raw_value          RAW(2000),
   date_value         DATE,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BOOLEAN (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BYTE (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_SHORT (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_INTEGER (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_LONG (
   name   IN VARCHAR2,
```

```
   value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
   name   IN VARCHAR2,
   value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
   name   IN VARCHAR2,
   value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
   name   IN VARCHAR2,
   value  IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
   name   IN VARCHAR2,
   value  IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
   name   IN VARCHAR2,
   value  IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );
```

Attributes

Table 59–5 SYS.MGW_NAME_VALUE_T Attributes

Attribute	Description
name	Name associated with the value
type	Value type. Refer to the DBMS_MGWMSG.<>_VALUE constants in Table 59–1. This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.
integer_value	Stores a numeric integer value
number_value	Stores a numeric float or large integer value
text_value	Stores a text value
raw_value	Stores a RAW (bytes) value
date_value	Stores a date value

SYS.MGW_NAME_VALUE_T Type-Attribute Mapping

Table 59–6 shows the mapping between the value type and the attribute used to store the value.

Table 59–6 SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
DBMS_MGWMSG.TEXT_VALUE	text_value
DBMS_MGWMSG.RAW_VALUE	raw_value
DBMS_MGWMSG.BOOLEAN_VALUE	integer_value

Table 59–6 (Cont.) SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
DBMS_MGWMSG.BYTE_VALUE	integer_value
DBMS_MGWMSG.SHORT_VALUE	integer_value
DBMS_MGWMSG.INTEGER_VALUE	integer_value
DBMS_MGWMSG.LONG_VALUE	number_value
DBMS_MGWMSG.FLOAT_VALUE	number_value
DBMS_MGWMSG.DOUBLE_VALUE	number_value
DBMS_MGWMSG.DATE_VALUE	date_value

CONSTRUCT Method

This method constructs a new SYS.MGW_NAME_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_*TYPE* Methods

These methods construct a new SYS.MGW_NAME_VALUE_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>_value attributes, as shown in the mappings in Table 59–6.

Syntax

```
STATIC FUNCTION CONSTRUCT_<> (
   name   IN VARCHAR2,
   value  IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

Usage Notes

The construct_boolean method sets the value to either DBMS_MGWMSG.BOOLEAN_TRUE or DBMS_MGWMSG.BOOLEAN_FALSE.

SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW_NAME_VALUE_ARRAY_T type can have up to 1024 elements.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
  AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

SYS.MGW_TEXT_VALUE_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >_ value attributes should be set.

Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
   small_value VARCHAR2(4000),
```

```
   large_value CLOB,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T);
```

Attributes

Table 59–7 SYS.MGW_TEXT_VALUE_T Attributes

Attribute	Description
small_value	Small TEXT value. Used for values <= 4000.
large_value	Large TEXT value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_TEXT_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;
```

SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >_value attributes.

Syntax

```
TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
   small_value RAW(2000),
   large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);
```

Attributes

Table 59–8 SYS.MGW_RAW_VALUE_T Attributes

Attribute	Description
small_value	Small RAW (bytes) value <= 2000
large_value	Large RAW value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_RAW_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
```

```
RETURN SYS.MGW_RAW_VALUE_T;
```

SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
   header     SYS.MGW_NAME_VALUE_ARRAY_T,
   text_body  SYS.MGW_TEXT_VALUE_T,
   raw_body   SYS.MGW_RAW_VALUE_T,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T);
```

Attributes

Table 59–9 SYS.MGW_BASIC_MSG_T Attributes

Attribute	Description
header	Message header information as an array of name-value pairs
text_body	Message body for a TEXT message
raw_body	Message body for a RAW (bytes) message

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

SYS.MGW_TIBRV_FIELD_T Type

A type representing a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
   field_name       VARCHAR2(256),
   field_id         INTEGER,
   field_type       INTEGER,
   number_value     NUMBER,
   number_array_value  SYS.MGW_NUMBER_ARRAY_T,
```

```
  text_value       VARCHAR2(4000),
  raw_value        RAW(2000),
  date_value       DATE,
  clob_value       CLOB,
  blob_value       BLOB);
```

Attributes

Table 59–10 SYS.MGW_TIBRV_FIELD_T Attributes

Attribute	Description
field_name	Field name. This will be NULL if the field has no name.
field_id	Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.
field_type	Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.
number_value	Used to store a numeric value
number_array_value	Used to store a numeric array value
text_value	Used to store a small text value
raw_value	Used to store a small raw value
date_value	Used to store a date value
clob_value	Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.
blob_value	Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.

SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Table 59–11 describes the mapping in type SYS.MGW_TIBRV_FIELD_T between the field type and attribute used to store the value.

Table 59–11 SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_BOOL	number_value
TIBRVMSG_F32	number_value
TIBRVMSG_F64	number_value
TIBRVMSG_I8	number_value
TIBRVMSG_I16	number_value
TIBRVMSG_I32	number_value
TIBRVMSG_I64	number_value
TIBRVMSG_IPADDR32	text_value
TIBRVMSG_IPPORT16	number_value
TIBRVMSG_DATETIME	date_value

Table 59–11 (Cont.) SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_F32ARRAY	number_array_value
TIBRVMSG_F64ARRAY	number_array_value
TIBRVMSG_I8ARRAY	number_array_value
TIBRVMSG_I16ARRAY	number_array_value
TIBRVMSG_I32ARRAY	number_array_value
TIBRVMSG_I64ARRAY	number_array_value
TIBRVMSG_OPAQUE	raw_value or blob_value
TIBRVMSG_STRING	text_value or clob_value
TIBRVMSG_XML	raw_value or blob_value

SYS.MGW_TIBRV_MSG_T Type

A type representing a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

Syntax

```
TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
   send_subject    VARCHAR2(256),
   reply_subject   VARCHAR2(256),
   cm_time_limit   NUMBER,
   cm_sender_name  VARCHAR2(256),
   cm_sequence_num NUMBER,
   fields          SYS.MGW_TIBRV_IFIELDS_T,
   clob_data1      CLOB,
   clob_data2      CLOB,
   clob_data3      CLOB,
   blob_data1      BLOB,
   blob_data2      BLOB,
   blob_data3      BLOB,

MEMBER FUNCTION find_field_id (
     id     IN INTEGER,
     start_idx IN INTEGER )
RETURN INTEGER
);
```

Attributes

Table 59–12 SYS.MGW_TIBRV_MSG_T Type Attributes

Attribute	Description
send_subject	Send subject name
reply_subject	Reply subject name
cm_time_limit	Time limit for a certified message
cm_sender_name	Sender name of a certified message
cm_sequence_num	Sequence number of a certified message
fields	Collection of message fields
clob_data1	Used to store a large text value
clob_data2	Used to store a large text value
clob_data3	Used to store a large text value
blob_data1	Used to store a large raw value
blob_data2	Used to store a large raw value
blob_data3	Used to store a large raw value

Construct Method

Constructs a new SYS.MGW_TIBRV_MSG_T instance. All attributes are set to NULL.

Syntax

```
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;
```

ADD_<> Procedures

Adds a new field to the message.

Syntax

```
MEMBER PROCEDURE ADD_<> (
   name  IN  VARCHAR2,
   id    IN  INTEGER,
   value IN  datatype );
```

Parameters

Table 59–13 SYS.MGW_TIBRV_MSG_T ADD_<> Method Parameters

Parameter	Description
name	Field name
id	Field identifier
value	Field data

Table 59–14 shows, for each add method, the field type that will be assigned and valid values for the field data.

Table 59–14 MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_bool	TIBRVMSG_BOOL	Valid values: 0 (false), 1 (true)
add_f32	TIBRVMSG_F32	n/a
add_f64	TIBRVMSG_F64	n/a
add_i8	TIBRVMSG_I8	Valid range: -128...127
add_i16	TIBRVMSG_I16	Valid range: -32768...32767
add_i32	TIBRVMSG_I32	Valid range: -2147483648... 2147483647
add_i64	TIBRVMSG_I64	n/a
add_ipaddr32	TIBRVMSG_IPADDR32	n/a
add_ipport16	TIBRVMSG_IPPORT16	n/a
add_datetime	TIBRVMSG_DATETIME	n/a
add_f32array	TIBRVMSG_F32ARRAY	n/a
add_f64array	TIBRVMSG_F64ARRAY	n/a
add_i8array	TIBRVMSG_I8ARRAY	Valid range: -128...127
add_i16array	TIBRVMSG_I16ARRAY	Valid range: -32768...32767
add_i32array	TIBRVMSG_I32ARRAY	Valid range: -2147483648... 2147483647
add_i64array	TIBRVMSG_I64ARRAY	n/a
add_opaque	TIBRVMSG_OPAQUE	Value stored as RAW if size < 2000; otherwise value stored in BLOB
add_string	TIBRVMSG_STRING	Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB

Table 59–14 (Cont.) MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_xml	TIBRVMSG_XML	Value stored as RAW if size < 2000; otherwise value stored in BLOB

SET_<> Methods

Accessor methods to set an instance attribute to a specific value.

Syntax

```
MEMBER PROCEDURE SET_<> (
  value IN datatype );
```

Parameters

Table 59–15 SYS.MGW_TIBRV_MSG_T SET_<> Method Parameters

Parameter	Description
value	Value to be assigned

GET_<> Methods

Accessor methods to retrieve the value for an instance attribute.

Syntax

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

Parameters

None

Return Values

Returns the attribute value.

GET_FIELD_COUNT Procedure

Gets the number of message fields.

Syntax

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Procedure

Retrieves field information for the field having a given field collection index. This method should only be called if the GET_FIELD_COUNT Procedure returns a

nonzero value and idx must specify a valid collection index; that is, 1<=idx<=get_field_count().

Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 59–16 SYS.MGW_TIBRV_MSG_T GET_FIELD Procedure Parameters

Parameter	Description
idx	Specifies the 1-based field collection index of the field to retrieve

Note: A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.

GET_FIELD_BY_NAME Procedure

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

```
MEMBER PROCEDURE get_field_by_name (
   name  IN   VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 59–17 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Procedure Parameters

Parameter	Description
name	Specifies the field name to search for. This can be NULL to find the first field that does not have a field name.

Return Values

Returns the field information, or NULL if no match was found.

GET_FIELD_BY_ID Procedure

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax

```
MEMBER PROCEDURE get_field_by_id (
   id   IN  INTEGER )
```

```
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 59–18 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Procedure Parameters

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Procedure

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

```
MEMBER PROCEDURE find_field_name (
   name      IN  VARCHAR2,
   start_idx IN  INTEGER )
RETURN INTEGER;
```

Parameters

Table 59–19 SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Procedure Parameters

Parameter	Description
name	Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.
start_idx	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

FIND_FIELD_ID Procedure

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

Syntax

```
MEMBER PROCEDURE find_field_id (
     id        IN  INTEGER,
     start_idx IN INTEGER )
RETURN    INTEGER;
```

Parameters

Table 59–20 SYS.MGW_TIBRV_MSG_T FIND_FIELD_ID Procedure Parameters

Parameter	Description
`id`	Specifies the field identifier to search for. This can be zero (0) or `NULL` to find a field that does not have an identifier.
`start_idx`	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

Summary of DBMS_MGWMSG Subprograms

Table 59–21 DBMS_MGWMSG Package Subprograms

Subprogram	Description
LCR_TO_XML Function on page 59-22	Converts a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD) to a SYS.XMLTYPE object
NVARRAY_ADD Procedure on page 59-23	Appends a name-value element to the end of a name-value array
NVARRAY_FIND_NAME Function on page 59-24	Searches a name-value array for the element with the name you specify in p_name
NVARRAY_FIND_NAME_TYPE Function on page 59-25	Searches a name-value array for an element with the name and value type you specify
NVARRAY_GET Function on page 59-26	Gets the name-value element of the name you specify in p_name from a name-value array
NVARRAY_GET_BOOLEAN Function on page 59-27	Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type
NVARRAY_GET_BYTE Function on page 59-28	Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type
NVARRAY_GET_DATE Function on page 59-29	Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type
NVARRAY_GET_DOUBLE Function on page 59-30	Gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type
NVARRAY_GET_FLOAT Function on page 59-31	Gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type
NVARRAY_GET_INTEGER Function on page 59-32	Gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type
NVARRAY_GET_LONG Function on page 59-33	Gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type
NVARRAY_GET_RAW Function on page 59-34	Gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type
NVARRAY_GET_SHORT Function on page 59-35	Gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type
NVARRAY_GET_TEXT Function on page 59-36	Gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type
XML_TO_LCR Function on page 59-37	Converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD)

LCR_TO_XML Function

This function converts a SYS.ANYDATA object encapsulating a row LCR (Logical Change Record, in this case a LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD) to a SYS.XMLTYPE object.

See Also: XML_TO_LCR Function on page 59-37

Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
   p_anydata IN SYS.ANYDATA )
 RETURN SYS.XMLTYPE;
```

Parameters

Table 59–22 LCR_TO_XML Function Parameters

Parameter	Description
p_anydata	An ANYDATA object to be converted

Return Values

Returns a SYS.XMLTYPE object.

Usage Notes

An exception is raised if the encapsulated type p_anydata is not an LCR.

NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (
   p_array  IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,
   p_value  IN     SYS.MGW_NAME_VALUE_T );
```

Parameters

Table 59–23 NVARRAY_ADD Procedure Parameters

Parameter	Description
p_array	On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.
p_value	The value to add. If NULL, then p_array is not changed.

NVARRAY_FIND_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 59–24 NVARRAY_FIND_NAME Function Parameters

Parameters	Description
`p_array`	The name-value array to search
`p_name`	The name to find
`p_compare`	Name comparison method. Values are `CASE_SENSITIVE` and `CASE_INSENSITIVE`.

Return Values

Returns a positive integer that is the array index of the matching element or zero (`0`) if the specified name is not found.

NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_type     IN BINARY_INTEGER
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 59–25 NVARRAY_FIND_NAME_TYPE Function Parameters

Parameter	Description
p_array	The name-value array to search
p_name	The name to find
p_type	The value type. Refer to the value type constants in Table 59–1 on page 59-4.
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

NVARRAY_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN SYS.MGW_NAME_VALUE_T;
```

Parameters

Table 59–26 NVARRAY_GET Function Parameters

Parameter	Description
`p_array`	The name-value array
`p_name`	The value name
`p_compare`	Name comparison method. Values are `CASE_SENSITIVE` and `CASE_INSENSITIVE`.

Return Values

Returns the matching element, or `NULL` if the specified name is not found.

NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 59–27 NVARRAY_GET_BOOLEAN Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 59–28 NVARRAY_GET_BYTE Function

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

Parameters

Table 59–29 NVARRAY_GET_DATE Function Parameters

Parameters	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 59–30 NVARRAY_GET_DOUBLE Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 59–31 NVARRAY_GET_FLOAT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_INTEGER Function

This function gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 59–32 NVARRAY_GET_INTEGER Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_LONG Function

This function gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 59–33 NVARRAY_GET_LONG Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

Table 59–34 NVARRAY_GET_RAW Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_SHORT Function

This function gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 59–35 NVARRAY_GET_SHORT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN VARCHAR2;
```

Parameters

Table 59–36 NVARRAY_GET_TEXT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

XML_TO_LCR Function

This function converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD).

See Also: LCR_TO_XML Function on page 59-22

Syntax

```
DBMS_MGWMSG.XML_TO_LCR (
   p_xmldata IN SYS.XMLTYPE )
 RETURN SYS.ANYDATA;
```

Parameters

Table 59–37 XML_TO_LCR Function Parameters

Parameter	Description
p_xmldata	An XMLTYPE object representing an LCR

Return Values

Returns a SYS.ANYDATA object.

Usage Notes

An exception is raised if p_xmldata cannot be converted to an LCR.

60

DBMS_MONITOR

The DBMS_MONITOR package let you use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

Summary of DBMS_MONITOR Subprograms

Table 60–1 DBMS_MONITOR Package Subprograms

Subprogram	Description
CLIENT_ID_STAT_DISABLE Procedure on page 60-3	Disables statistic gathering previously enabled for a given Client Identifier
CLIENT_ID_STAT_ENABLE Procedure on page 60-4	Enables statistic gathering for a given Client Identifier
CLIENT_ID_TRACE_DISABLE Procedure on page 60-5	Disables the trace previously enabled for a given Client Identifier globally for the database
CLIENT_ID_TRACE_ENABLE Procedure on page 60-6	Enables the trace for a given Client Identifier globally for the database
DATABASE_TRACE_DISABLE Procedure on page 60-7	Disables SQL trace for the whole database or a specific instance
DATABASE_TRACE_ENABLE Procedure on page 60-8	Enables SQL trace for the whole database or a specific instance
SERV_MOD_ACT_STAT_ DISABLE Procedure on page 60-9	Disables statistic gathering enabled for a given combination of Service Name, `MODULE` and `ACTION`
SERV_MOD_ACT_STAT_ ENABLE Procedure on page 60-10	Enables statistic gathering for a given combination of Service Name, `MODULE` and `ACTION`
SERV_MOD_ACT_TRACE_ DISABLE Procedure on page 60-12	Disables the trace for ALL enabled instances for a or a given combination of Service Name, `MODULE` and `ACTION` name globally
SERV_MOD_ACT_TRACE_ ENABLE Procedure on page 60-13	Enables SQL tracing for a given combination of Service Name, `MODULE` and `ACTION` globally unless an `instance_name` is specified
SESSION_TRACE_DISABLE Procedure on page 60-15	Disables the previously enabled trace for a given database session identifier (SID) on the local instance
SESSION_TRACE_ENABLE Procedure on page 60-16	Enables the trace for a given database session identifier (SID) on the local instance

CLIENT_ID_STAT_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(
   client_id            IN   VARCHAR2);
```

Parameters

Table 60–2 CLIENT_ID_STAT_DISABLE Procedure Parameters

Parameter	Description
client_id	The Client Identifier for which statistic aggregation is disabled.

Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier. Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V$CLIENT_STATS views.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(
   client_id            IN   VARCHAR2);
```

Parameters

Table 60–3 CLIENT_ID_STAT_ENABLE Procedure Parameters

Parameter	Description
client_id	The Client Identifier for which statistic aggregation is enabled.

Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT_ID_TRACE_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
 client_id            IN   VARCHAR2);
```

Parameters

Table 60–4 CLIENT_ID_TRACE_DISABLE Procedure Parameters

Parameter	Description
client_id	The Client Identifier for which SQL tracing is disabled.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(
   client_id    IN  VARCHAR2,
   waits        IN  BOOLEAN DEFAULT TRUE,
   binds        IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 60–5 CLIENT_ID_TRACE_ENABLE Procedure Parameters

Parameter	Description
client_id	Database Session Identifier for which SQL tracing is enabled.
waits	If TRUE, wait information is present in the trace.
binds	If TRUE, bind information is present in the trace.

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,
FALSE);
```

DATABASE_TRACE_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(
   instance_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–6 DATABASE_TRACE_DISABLE Procedure Parameters

Parameter	Description
instance_name	Disables tracing for the named instance

DATABASE_TRACE_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(
   waits          IN BOOLEAN DEFAULT TRUE,
   binds          IN BOOLEAN DEFAULT FALSE,
   instance_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–7 DATABASE_TRACE_ENABLE Procedure Parameters

Parameter	Description
`waits`	If `TRUE`, wait information will be present in the trace
`binds`	If `TRUE`, bind information will be present in the trace
`instance_name`	If set, restricts tracing to the named instance

SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V$SERV_MOD_ACT_STATS view. Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2,
   action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 60–8 SERV_MOD_ACT_STAT_DISABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which statistic aggregation is disabled.
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION. Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V$SERV_MOD_ACT_STATS view.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2,
   action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 60–9 SERV_MOD_ACT_STAT_ENABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which statistic aggregation is enabled.
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Server/Module combination. In this case, statistics are aggregated on the module level.

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL_ACTIONS for a module specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1','PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1','GLEDGER','DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.

- For all actions in the PAYROLL Module.
- For the DEBIT_ENTRY Action within the GLEDGER Module.

SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2,
   action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS,
   instance_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–10 SERV_MOD_ACT_TRACE_DISABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which tracing is disabled.
module_name	Name of the MODULE. An additional qualifier for the service.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name.
instance_name	If set, this restricts tracing to the named instance_name.

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
            DBMS_MONITOR.ALL_MODULES,  DBMS_MONITOR.ALL_ACTIONS,TRUE,
FALSE,NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONs):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
            DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1','PAYROLL');
```

SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2 DEFAULT ANY_MODULE,
   action_name     IN VARCHAR2 DEFAULT ANY_ACTION,
   waits           IN BOOLEAN DEFAULT TRUE,
   binds           IN BOOLEAN DEFAULT FALSE,
   instance_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–11 SERV_MOD_ACT_TRACE_ENABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which tracing is enabled.
module_name	Name of the MODULE. An optional additional qualifier for the service.
action_name	Name of the ACTION. An optional additional qualifier for the Service and MODULE name.
waits	If TRUE, wait information is present in the trace.
binds	If TRUE, bind information is present in the trace.
instance_name	If set, this restricts tracing to the named instance_name.

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONs. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.
- Specifying NULL for the module_name parameter means that statistics will be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
            DBMS_MONITOR.ALL_MODULES,  DBMS_MONITOR.ALL_ACTIONS,TRUE,
```

```
FALSE,NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONs):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
            DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
   session_id      IN     BINARY_INTEGER DEFAULT NULL,
   serial_num      IN     BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 60–12 SESSION_TRACE_DISABLE Procedure Parameters

Parameter	Description
session_id	Name of the service for which SQL trace is disabled.
serial_num	Serial number for this session.

Usage Notes

If serial_num is NULL but session_id is specified, a session with a given session_id is no longer traced irrespective of its serial number. If both session_id and serial_num are NULL, the current user session is no longer traced. It is illegal to specify NULL session_id and non-NULL serial_num. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE(
    session_id   IN  BINARY_INTEGER DEFAULT NULL,
    serial_num   IN  BINARY_INTEGER DEFAULT NULL,
    waits        IN  BOOLEAN DEFAULT TRUE,
    binds        IN  BOOLEAN DEFAULT FALSE)
```

Parameters

Table 60–13 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
session_id	Database Session Identifier for which SQL tracing is enabled. Specifying NULL means that my current session should be traced.
serial_num	Serial number for this session. Specifying NULL means that any session which matches session_id (irrespective of serial number) should be traced.
waits	If TRUE, wait information is present in the trace.
binds	If TRUE, bind information is present in the trace.

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If serial_num is NULL but session_id is specified, a session with a given session_id is traced irrespective of its serial number. If both session_id and serial_num are NULL, the current user session is traced. It is illegal to specify NULL session_id and non-NULL serial_num. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

61

DBMS_MVIEW

DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

Note: DBMS_SNAPSHOT is a synonym for DBMS_MVIEW.

See Also:

- *Oracle Database Advanced Replication* for more information about using materialized views in a replication environment
- *Oracle Database Data Warehousing Guide* for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:

Using DBMS_MVIEW

This section contains topics which relate to using the `DBMS_MVIEW` package.

Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN..END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

Rules and Limits

The EXPLAIN_REWRITE procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the EXPLAIN_MVIEW procedure.

Summary of DBMS_MVIEW Subprograms

Table 61–1 DBMS_MVIEW Package Subprograms

Subprogram	Description
BEGIN_TABLE_ REORGANIZATION Procedure on page 61-6	Performs a process to preserve materialized view data needed for refresh
END_TABLE_ REORGANIZATION Procedure on page 61-7	Ensures that the materialized view data for the master table is valid and that the master table is in the proper state
ESTIMATE_MVIEW_SIZE Procedure on page 61-8	Estimates the size of a materialized view that you might create, in bytes and rows
EXPLAIN_MVIEW Procedure on page 61-9	Explains what is possible with a materialized view or potential materialized view
EXPLAIN_REWRITE Procedure on page 61-10	Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views
I_AM_A_REFRESH Function on page 61-12	Returns the value of the `I_AM_REFRESH` package state
PMARKER Function on page 61-13	Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)
PURGE_DIRECT_LOAD_LOG Procedure on page 61-14	Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)
PURGE_LOG Procedure on page 61-15	Purges rows from the materialized view log
PURGE_MVIEW_FROM_LOG Procedure on page 61-16	Purges rows from the materialized view log
REFRESH Procedures on page 61-17	Refreshes one or more materialized views that are not members of the same refresh group
REFRESH_ALL_MVIEWS Procedure on page 61-19	Refreshes all materialized views that do not reflect changes to their master table or master materialized view
REFRESH_DEPENDENT Procedures on page 61-20	Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views
REGISTER_MVIEW Procedure on page 61-22	Enables the administration of individual materialized views
UNREGISTER_MVIEW Procedure on page 61-24	Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view

BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
   tabowner    IN   VARCHAR2,
   tabname     IN   VARCHAR2);
```

Parameters

Table 61–2 BEGIN_TABLE_REORGANIZATION Procedure Parameters

Parameter	Description
`tabowner`	Owner of the table being reorganized
`tabname`	Name of the table being reorganized

END_TABLE_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (
   tabowner    IN   VARCHAR2,
   tabname     IN   VARCHAR2);
```

Parameters

Table 61–3 END_TABLE_REORGANIZATION Procedure Parameters

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (
   stmt_id       IN  VARCHAR2,
   select_clause IN  VARCHAR2,
   num_rows      OUT NUMBER,
   num_bytes     OUT NUMBER);
```

Parameters

Table 61–4 ESTIMATE_MVIEW_SIZE Procedure Parameters

Parameter	Description
`stmt_id`	Arbitrary string used to identify the statement in an `EXPLAIN PLAN`
`select_clause`	The `SELECT` statement to be analyzed
`num_rows`	Estimated cardinality
`num_bytes`	Estimated number of bytes

EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call DBMS_MVIEW.EXPLAIN_MVIEW, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the SELECT string or CREATE MATERIALIZED VIEW statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called MV_CAPABILITIES_TABLE, which is the default, or to an array called MSG_ARRAY.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to MV_CAPABILITIES_TABLE.
- The second version is for explaining an existing or potential materialized view with output to a VARRAY.

Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
   mv            IN VARCHAR2,
   statement_id  IN VARCHAR2:= NULL);

DBMS_MVIEW.EXPLAIN_MVIEW (
   mv          IN VARCHAR2,
   msg_array   OUT SYS.ExplainMVArrayType);
```

Parameters

Table 61–5 EXPLAIN_MVIEW Procedure Parameters

Parameter	Description
mv	The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a SELECT statement or a CREATE MATERIALIZED VIEW statement for a potential materialized view.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of EXPLAIN_MVIEW
msg_array	The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_MVIEW's output to a PL/SQL VARRAY rather than MV_CAPABILITIES_TABLE.

Usage Notes

You must run the utlxmv.sql script to create MV_CAPABILITIES_TABLE in the current schema prior to calling EXPLAIN_MVIEW except when you direct output to a VARRAY. The script is found in the ADMIN directory.

EXPLAIN_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used. Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the EXPLAIN_REWRITE statement is never actually executed.

A demo file, xrwutl.sql, is available to help format the output from EXPLAIN_REWRITE.

Syntax

You can obtain the output from DBMS_MVIEW.EXPLAIN_REWRITE in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query           VARCHAR2,
    mv              VARCHAR2(30),
    statement_id    VARCHAR2(30));
```

You can create an output table called REWRITE_TABLE by executing the utlxrw.sql script.

The query parameter is a text string representing the SQL query. The parameter, mv, is a fully qualified materialized view name in the form of schema.mv. This is an optional parameter. When it is not specified, EXPLAIN_REWRITE returns any relevant messages regarding all the materialized views considered for rewriting the given query. When schema is omitted and only mv is specified, EXPLAIN_REWRITE looks for the materialized view in the current schema.

If you want to direct the output of EXPLAIN_REWRITE to a VARRAY instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query           [VARCHAR2 | CLOB],
    mv               VARCHAR2(30),
    output_array     SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, EXPLAIN_REWRITE can be easily invoked with the EXECUTE command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL BEGIN... END block, as shown in the examples in /rdbms/demo/smxrw*.

You can also use EXPLAIN_REWRITE with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views mv1, mv2, and mv3 could be used to rewrite the query, query_txt, and, if not, why not, use EXPLAIN_REWRITE as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the EXPLAIN_REWRITE procedure.

Parameters

Table 61–6 EXPLAIN_REWRITE Procedure Parameters

Parameter	Description
query	SQL SELECT statement to be explained
mv	The fully qualified name of an existing materialized view in the form of SCHEMA.MV. For multiple materialized views, you can provide a comma-delimited list of names.
statement_id	A client-supplied unique identifier to distinguish output messages
msg_array	The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_REWRITE's output to a PL/SQL VARRAY.

Usage Notes

To obtain the output into a table, you must run the utlxrw.sql script before calling EXPLAIN_REWRITE. This script creates a table named REWRITE_TABLE in the current schema.

I_AM_A_REFRESH Function

This function returns the value of the `I_AM_REFRESH` package state.

Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH
   RETURN BOOLEAN;
```

Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

```
DBMS_MVIEW.PMARKER(
   rid IN ROWID)
 RETURN NUMBER;
```

Parameters

Table 61–7 PMARKER Procedure Parameters

Parameter	Description
rid	The rowid of a row entry in a master table

PURGE_DIRECT_LOAD_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information

Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();
```

PURGE_LOG Procedure

This procedure purges rows from the materialized view log.

Syntax

```
DBMS_MVIEW.PURGE_LOG (
   master         IN   VARCHAR2,
   num            IN   BINARY_INTEGER := 1,
   flag           IN   VARCHAR2       := 'NOP');
```

Parameters

Table 61–8 PURGE_LOG Procedure Parameters

Parameter	Description
`master`	Name of the master table or master materialized view.

`num`	Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:
	`DBMS_MVIEW.PURGE_LOG('master_table', 2);`
	To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:
	`DBMS_MVIEW.PURGE_LOG('master_table',9999);`
	This statement completely purges the materialized view log that corresponds to `master_table` if fewer than 9999 materialized views are based on `master_table`. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.

`flag`	Specify `delete` to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter `num`. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view: `DBMS_MVIEW.PURGE_LOG('master_table',1,'delete');`

PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by its `mview_id` or the combination of the `mviewowner`, `mviewname`, and the `mviewsite`. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
   mview_id       IN   BINARY_INTEGER  |
   mviewowner     IN   VARCHAR2,
   mviewname      IN   VARCHAR2,
   mviewsite      IN   VARCHAR2);
```

> **Note:** This procedure is overloaded. The `mview_id` parameter is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

Parameters

Table 61–9 PURGE_MVIEW_FROM_LOG Procedure Parameters

Parameter	Description
`mview_id`	If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the `mview_id` parameter. Query the `DBA_BASE_TABLE_MVIEWS` view at the materialized view log site for a listing of materialized view IDs. Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (`DBA_REGISTERED_MVIEWS`).
`mviewowner`	If you do not specify an `mview_id`, enter the owner of the target materialized view using the `mviewowner` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view owners.
`mviewname`	If you do not specify an `mview_id`, enter the name of the target materialized view using the `mviewname` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view names.
`mviewsite`	If you do not specify an `mview_id`, enter the site of the target materialized view using the `mviewsite` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view sites.

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

REFRESH Procedures

This procedure refreshes a list of materialized views.

Syntax

```
DBMS_MVIEW.REFRESH (
   { list                 IN     VARCHAR2,
   | tab                  IN     DBMS_UTILITY.UNCL_ARRAY,}
   method                 IN     VARCHAR2       := NULL,
   rollback_seg           IN     VARCHAR2       := NULL,
   push_deferred_rpc      IN     BOOLEAN        := true,
   refresh_after_errors   IN     BOOLEAN        := false,
   purge_option           IN     BINARY_INTEGER := 1,
   parallelism            IN     BINARY_INTEGER := 0,
   heap_size              IN     BINARY_INTEGER := 0,
   atomic_refresh         IN     BOOLEAN        := true,
   nested                 IN     BOOLEAN        := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 61–10 REFRESH Procedure Parameters

Parameter	Description
`list | tab`	Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type `DBMS_UTILITY.UNCL_ARRAY`, where each element is the name of a materialized view.

`method`	A string of refresh methods indicating how to refresh the listed materialized views. An `f` indicates fast refresh, `?` indicates force refresh, `C` or `c` indicates complete refresh, and `A` or `a` indicates always refresh. `A` and `C` are equivalent. `P` or `p` refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
	
	If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following `EXECUTE` statement within SQL*Plus:
	
	`DBMS_MVIEW.REFRESH`
	`('countries_mv,regions_mv,hr.employees_mv','cf');`
	
	This statement performs a complete refresh of the `countries_mv` materialized view, a fast refresh of the `regions_mv` materialized view, and a default refresh of the `hr.employees` materialized view.

`rollback_seg`	Name of the materialized view site rollback segment to use while refreshing materialized views

Table 61–10 (Cont.) REFRESH Procedure Parameters

Parameter	Description
`push_deferred_rpc`	Used by updatable materialized views only. Set this parameter to `true` if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.
`refresh_after_errors`	If this parameter is `true`, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the `DEFERROR` view for the materialized view's master table or master materialized view. If this parameter is `true` and `atomic_refresh` is `false`, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
`purge_option`	If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to `0` and occasionally execute `PUSH` with this parameter set to `2` to reduce the queue.
`parallelism`	0 specifies serial propagation. *n* > 1 specifies parallel propagation with *n* parallel processes. 1 specifies parallel propagation using only one parallel process.
`heap_size`	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. Note**:** Do not set this parameter unless directed to do so by Oracle Support Services.
`atomic_refresh`	If this parameter is set to `true`, then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to `false`, then each of the materialized views is refreshed in a separate transaction.
`nested`	If `true`, then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
   number_of_failures     OUT   BINARY_INTEGER,
   method                 IN    VARCHAR2         := NULL,
   rollback_seg           IN    VARCHAR2         := NULL,
   refresh_after_errors   IN    BOOLEAN          := false,
   atomic_refresh         IN    BOOLEAN          := true);
```

Parameters

Table 61–11 REFRESH_ALL_MVIEWS Procedure Parameters

Parameter	Description
number_of_ failures	Returns the number of failures that occurred during processing
method	A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_ errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.

REFRESH_DEPENDENT Procedures

This procedure refreshes all materialized views that have the following properties:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
   number_of_failures     OUT    BINARY_INTEGER,
   { list                 IN     VARCHAR2,
   | tab                  IN     DBMS_UTILITY.UNCL_ARRAY,}
   method                 IN     VARCHAR2    := NULL,
   rollback_seg           IN     VARCHAR2    := NULL,
   refresh_after_errors   IN     BOOLEAN     := false,
   atomic_refresh         IN     BOOLEAN     := true,
   nested                 IN     BOOLEAN     := false);
```

Note: This procedure is overloaded. The list and tab parameters are mutually exclusive.

Parameters

Table 61–12 REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
number_of_ failures	Returns the number of failures that occurred during processing
list | tab	Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type DBMS_ UTILITY.UNCL_ARRAY, where each element is the name of a table.

Table 61–12 (Cont.) REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
method	A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus: `DBMS_MVIEW.REFRESH_DEPENDENT ('employees,deptartments,hr.regions','cf');` performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.
nested	If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
   mviewowner  IN   VARCHAR2,
   mviewname   IN   VARCHAR2,
   mviewsite   IN   VARCHAR2,
   mview_id    IN   DATE | BINARY_INTEGER,
   flag        IN   BINARY_INTEGER,
   qry_txt     IN   VARCHAR2,
   rep_type    IN   BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

Table 61–13 REGISTER_MVIEW Procedure Parameters

Parameter	Description
mviewowner	Owner of the materialized view.
mviewname	Name of the materialized view.
mviewsite	Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.
mview_id	The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.
flag	A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter: DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.
qry_txt	The first 32,000 bytes of the materialized view definition query.

Table 61–13 (Cont.) REGISTER_MVIEW Procedure Parameters

Parameter	Description
rep_type	Version of the materialized view. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site ■ DBMS_MVIEW.REG_V8_SNAPSHOT reg_repapi_snapshot if the materialized view is at an Oracle database version 8.x or higher site DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site

Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview_id, flag, and qry_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (
   mviewowner      IN   VARCHAR2,
   mviewname       IN   VARCHAR2,
   mviewsite       IN   VARCHAR2);
```

Parameters

Table 61–14 UNREGISTER_MVIEW Procedure Parameters

Parameters	Description
mviewowner	Owner of the materialized view
mviewname	Name of the materialized view
mviewsite	Name of the materialized view site

62

DBMS_OBFUSCATION_TOOLKIT

DBMS_OBFUSCATION_TOOLKIT enables an application to encrypt data using either the Data Encryption Standard (DES) or the Triple DES algorithms.

This chapter contains the following topics:

Using DBMS_OBFUSCATION_TOOLKIT

Overview

The Data Encryption Standard (DES), also known as the Data Encryption Algorithm (DEA) by the American National Standards Institute (ANSI) and DEA-1 by the International Standards Organization (ISO), has been a worldwide encryption standard for over 20 years. The banking industry has also adopted DES-based standards for transactions between private financial institutions, and between financial institutions and private individuals. DES will eventually be replaced by a new Advanced Encryption Standard (AES).

DES is a symmetric key cipher; that is, the same key is used to encrypt data as well as decrypt data. DES encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm ignores 8 bits of the 64-bit key that is supplied; however, you must supply a 64-bit key to the algorithm.

Triple DES (3DES) is a far stronger cipher than DES; the resulting ciphertext (encrypted data) is much harder to break using an exhaustive search: 2**112 or 2**168 attempts instead of 2**56 attempts. Triple DES is also not as vulnerable to certain types of cryptanalysis as is DES.

Security Model

Oracle installs this package in the SYS schema. You can then grant package access to existing users and roles as needed. The package also grants access to the PUBLIC role so no explicit grant needs to be done.

Operational Notes

Key Management

Key management, including both generation and secure storage of cryptographic keys, is one of the most important aspects of encryption. If keys are poorly chosen or stored improperly, then it is far easier for a malefactor to break the encryption. Rather than using an exhaustive key search attack (that is, cycling through all the possible keys in hopes of finding the correct decryption key), cryptanalysts typically seek weaknesses in the choice of keys, or the way in which keys are stored.

Key generation is an important aspect of encryption. Typically, keys are generated automatically through a random-number generator. Provided that the random number generation is cryptographically secure, this can be an acceptable form of key generation. However, if random numbers are not cryptographically secure, but have elements of predictability, the security of the encryption may be easily compromised.

The `DBMS_OBFUSCATION_TOOLKIT` package includes tools for generating random material that can be used for encryption keys, but it does not provide a mechanism for maintaining them. Care must be taken by the application developer to ensure the secure generation and storage of encryption keys used with this package. Furthermore, the encryption and decryption done by the `DBMS_OBFUSCATION_TOOLKIT` takes place on the server, not the client. If the key is passed over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire. See *Oracle Database Advanced Security Administrator's Guide* for information about configuring and using network encryption for Oracle Net.

Key storage is one of the most important, yet difficult aspects of encryption and one of the hardest to manage properly. To recover data encrypted with a symmetric key, the key must be accessible to the application or user seeking to decrypt data. The key needs to be easy enough to retrieve that users can access encrypted data when they need to without significant performance degradation. The key also needs to be secure enough that it is not easily recoverable by unauthorized users trying to access encrypted data that they are not supposed to see.

The three options available are:

- Store the key in the database
- Store the key in the operating system
- Have the user manage the key

Storing the Key in the Database

Storing the keys in the database cannot always provide bullet-proof security if you are trying to protect data against the DBA accessing encrypted data (since an all-privileged DBA can access tables containing encryption keys), but it can provide security against the casual snooper, or against someone compromising the database files on the operating system. Furthermore, the security you can obtain by storing keys in the database does not have to be bullet-proof in order to be extremely useful.

For example, suppose you want to encrypt an employee's social security number, one of the columns in table EMP. You could encrypt each employee's SSN using a key which is stored in a separate column in EMP. However, anyone with SELECT access on the EMP table could retrieve the encryption key and decrypt the matching social security number. Alternatively, you could store the encryption keys in another table, and use a package to retrieve the correct key for the encrypted data item, based on a primary key-foreign key relationship between the tables.

You can envelope both the `DBMS_OBFUSCATION_TOOLKIT` package and the procedure to retrieve the encryption keys supplied to the package. Furthermore, the encryption key itself could be transformed in some way (for example, XORed with the foreign key to the EMP table) so that the key itself is not stored in easily recoverable form.

Oracle recommends using the wrap utility of PL/SQL to obfuscate the code within a PL/SQL package itself that does the encryption. That prevents people from breaking the encryption by looking at the PL/SQL code that handles keys, calls encrypting routines, and so on. In other words, use the wrap utility to obfuscate the PL/SQL packages themselves. This scheme is secure enough to prevent users with `SELECT` access to `EMP` from reading unencrypted sensitive data, and a DBA from easily retrieving encryption keys and using them to decrypt data in the `EMP` table. It can be made more secure by changing encryption keys regularly, or having a better key storage algorithm (so the keys themselves are encrypted, for example).

Storing the Key in the Operating System

Storing keys in a flat file in the operating system is another option. You can make callouts from PL/SQL, which you can use to retrieve encryption keys. If you store keys in a file and make callouts to retrieve the keys, the security of your encrypted data is only as secure as the protection of the key file on the operating system. Of course, a user retrieving keys from the operating system would have to be able to either access the Oracle database files (to decrypt encrypted data), or be able to gain access to the table in which the encrypted data is stored as a legitimate user.

User-Supplied Keys

If you ask a user to supply the key, it is crucial that you use network encryption, such as that provided by Oracle Advanced Security, so the key is not passed from client to server in the clear. The user must remember the key, or your data is not recoverable.

Summary of DBMS_OBFUSCATION Subprograms

Table 62–1 DBMS_OBFUSCATION Package Subprograms

Subprogram	Description
DES3DECRYPT Procedures and Functions on page 62-8	Generates the decrypted form of the input data
DES3ENCRYPT Procedures and Functions on page 62-10	Generates the encrypted form of the input data by passing it through the Triple DES encryption algorithm
DES3GETKEY Procedures and Functions on page 62-8	Takes a random value and uses it to generate an encryption key, using Triple DES
DESDECRYPT Procedures and Functions on page 62-13	Generates the decrypted form of the input data
DESENCRYPT Procedures and Functions on page 62-15	Generates the encrypted form of the input data
DESGETKEY Procedures and Functions on page 62-17	Takes a random value and uses it to generate an encryption key
MD5 Procedures and Functions on page 62-18	Generates MD5 hashes of data

DES3DECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

For a discussion of the initialization vector that you can use with this procedure, see the section, "DES3ENCRYPT Procedures and Functions" on page 62-10.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input             IN   RAW,
   key               IN   RAW,
   decrypted_data    OUT  RAW,
   which             IN   PLS_INTEGER  DEFAULT TwoKeyMode
   iv                IN   RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input_string      IN   VARCHAR2,
   key_string        IN   VARCHAR2,
   decrypted_string  OUT  VARCHAR2,
   which             IN   PLS_INTEGER  DEFAULT TwoKeyMode
   iv_string         IN   VARCHAR2     DEFAUTL NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input         IN  RAW,
   key           IN  RAW,
   which         IN  PLS_INTEGER DEFAULT TwoKeyMode
   iv            IN  RAW         DEFAULT NULL)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input_string  IN  VARCHAR2,
   key_string    IN  VARCHAR2,
   which         IN  PLS_INTEGER DEFAULT TwoKeyMode
   iv_string     IN  VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 62–2 DES3DECRYPT Parameters for Raw Data

Parameter	Description
input	Data to be decrypted
key	Decryption key
decrypted_data	Decrypted data
which	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
iv	Initialization vector
input_string	String to be decrypted
key_string	Decryption key string
decrypted_ string	Decrypted string
iv_string	Initialization vector

Usage Notes

If the input data or key given to the DES3DECRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DES3DECRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit." ORA-28233 is NOT applicable for the DES3DECRYPT function.

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the WHICH parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

Restrictions

You must supply a single key of either 128 bits for a 2-key implementation (of which only 112 are used), or a single key of 192 bits for a 3-key implementation (of which 168 bits are used). Oracle automatically truncates the supplied key into 56-bit lengths for decryption. This key length is fixed and cannot be altered.

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3ENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data by passing it through the Triple DES (3DES) encryption algorithm.

Oracle's implementation of 3DES supports either a 2-key or 3-key implementation, in outer cipher-block-chaining (CBC) mode.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input           IN     RAW,
   key             IN     RAW,
   encrypted_data  OUT    RAW,
   which           IN     PLS_INTEGER  DEFAULT TwoKeyMode
   iv              IN     RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input_string      IN     VARCHAR2,
   key_string        IN     VARCHAR2,
   encrypted_string  OUT    VARCHAR2,
   which             IN     PLS_INTEGER  DEFAULT TwoKeyMode
   iv_string         IN     VARCHAR2     DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input        IN RAW,
   key          IN RAW,
   which        IN PLS_INTEGER DEFAULT TwoKeyMode
   iv           IN RAW         DEFAULT NULL)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input_string  IN VARCHAR2,
   key_string    IN VARCHAR2,
   which         IN PLS_INTEGER DEFAULT TwoKeyMode
   iv_string     IN VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 62–3 DES3ENCRYPT Parameters Procedure and Function

Parameter	Description
`input`	Data to be encrypted.
`key`	Encryption key.
`encrypted_data`	Encrypted data.
`which`	If = 0, (default), then `TwoKeyMode` is used. If = 1, then `ThreeKeyMode` is used.
iv	Initialization vector.
`input_string`	String to be encrypted.
`key_string`	Encryption key string.
`encrypted_ string`	Encrypted string.
iv_string	Initialization vector.

Usage Notes

If you are using Oracle's 3DES interface with a 2-key implementation, you must supply a single key of 128 bits as an argument to the DES3ENCRYPT procedure. With a 3-key implementation, you must supply a single key of 192 bits. Oracle then breaks the supplied key into two 64-bit keys. As with DES, the 3DES algorithm throws away 8 bits of each derived key. However, you must supply a single 128-bit key for the 2-key 3DES implementation or a single 192-bit key for the 3-key 3DES implementation; otherwise the package will raise an error. The DES3ENCRYPT procedure uses the 2-key implementation by default.

You also have the option of providing an *initialization vector* (IV) with the DES3ENCRYPT procedure. An IV is a block of random data prepended to the data you intend to encrypt. The IV has no meaning. It is there to make each message unique. Prepending an IV to your input data avoids starting encrypted blocks of data with common header information, which may give cryptanalysts information they can use to decrypt your data.

If the input data or key given to the PL/SQL DES3ENCRYPT procedure is empty, then the procedure raises the error `ORA-28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the DES3ENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double encrypt data using the DES3ENCRYPT procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the `which` parameter, `ORA-28236 "Invalid Triple DES mode"` is generated. Only the values 0 (`TwoKeyMode`) and 1 (`ThreeKeyMode`) are valid.

Restrictions

The DES3ENCRYPT procedure has two restrictions. The first is that the DES key length for encryption is fixed at 128 bits (for 2-key DES) or 192 bits (for 3-key DES); you cannot alter these key lengths.

The second is that you cannot execute multiple passes of encryption using 3DES. (Note: the 3DES algorithm itself encrypts data multiple times; however, you cannot call the DES3ENCRYPT function itself more than once to encrypt the same data using 3DES.)

> **Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3GETKEY Procedures and Functions

These subprograms take a random value and uses it to generate an encryption key. For Triple DES, you specify the mode so that the returned key has the proper length.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
   seed         IN   RAW,
   key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
   seed_string  IN   VARCHAR2,
   key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which  IN  PLS_INTEGER DEFAULT TwoKeyMode,
   seed   IN  RAW)
 RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN  PLS_INTEGER DEFAULT TwoKeyMode,
   seed_string  IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 62–4 DES3GETKEY Procedure and Function Parameters

Parameter	Description
`which`	If = 0, (default), then `TwoKeyMode` is used. If = 1, then `ThreeKeyMode` is used.
`seed`	A value at least 80 characters long.
`key`	Encryption key.
`seed_string`	A value at least 80 characters long.
`key`	Encryption key.

DESDECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input             IN   RAW,
   key               IN   RAW,
   decrypted_data    OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input_string      IN   VARCHAR2,
   key_string        IN   VARCHAR2,
   decrypted_string  OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input            IN  RAW,
   key              IN  RAW)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input_string     IN  VARCHAR2,
   key_string       IN  VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 62–5 DESDECRYPT Procedure and Function Parameters

Parameter	Description
`input`	Data to be decrypted.
`key`	Decryption key.
`decrypted_data`	Decrypted data.
`input_string`	String to be decrypted.
`key_string`	Decryption key string.
`decrypted_string`	Decrypted string.

Usage Notes

If the input data or key given to the PL/SQL `DESDECRYPT` function is empty, then Oracle raises `ORA error 28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the `DESDECRYPT` function is not a multiple of 8 bytes, Oracle raises `ORA error 28232 "Invalid input size for Obfuscation toolkit."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

> **Note:** `ORA-28233` is not applicable to the `DESDECRYPT` function.

Restrictions

The DES key length for encryption is fixed at 64 bits (of which 56 bits are used); you cannot alter this key length.

Note: The key length limitation is a requirement of U.S. regulations governing the export of cryptographic products.

DESENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input            IN    RAW,
   key              IN    RAW,
   encrypted_data   OUT   RAW);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input_string     IN    VARCHAR2,
   key_string       IN    VARCHAR2,
   encrypted_string OUT   VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input         IN  RAW,
   key           IN  RAW)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input_string  IN  VARCHAR2,
   key_string    IN  VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 62–6 DESENCRYPT Procedure and Function Parameters

Parameter	Description
`input`	Data to be encrypted.
`key`	Encryption key.
`encrypted_data`	Encrypted data.
`input_string`	String to be encrypted.
`key_string`	Encryption key string.
`encrypted_string`	Encrypted string.

Usage Notes

The DES algorithm encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm throws away 8 bits of the supplied key (the particular bits which are thrown away is beyond the scope of this documentation). However, when using the algorithm, you must supply a 64-bit key or the package will raise an error.

If the input data or key given to the PL/SQL DESEncrypt procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit".

If the input data given to the `DESENCRYPT` procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double-encrypt data using the `DESENCRYPT` procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Restrictions

The `DESENCRYPT` procedure has the following restrictions:

- The DES key length for encryption is fixed at 56 bits; you cannot alter this key length.
- You cannot execute multiple passes of encryption. That is, you cannot re-encrypt previously encrypted data by calling the function twice.

> **Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DESGETKEY Procedures and Functions

These subprograms take a random value and use it to generate an encryption key.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed         IN   RAW,
   key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed_string  IN   VARCHAR2,
   key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed IN RAW)
 RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed_string IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 62–7 DESGETKEY Procedure and Function Parameters

Parameter	Description
`seed`	A value at least 80 characters long.
`key`	Encryption key.
`seed_string`	A value at least 80 characters long.
`key`	Encryption key.

MD5 Procedures and Functions

These subprograms generate MD5 hashes of data. The MD5 algorithm ensures data integrity by generating a 128-bit cryptographic message digest value from given data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.MD5(
   input            IN   RAW,
   checksum         OUT  raw_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input_string     IN   VARCHAR2,
   checksum_string  OUT  varchar2_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input         IN  RAW)
  RETURN raw_checksum;

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input_string  IN  VARCHAR2)
  RETURN varchar2_checksum;
```

Parameters

Table 62–8 MD5 Procedure and Function Parameters

Parameter Name	Description
`input`	Data to be hashed
`checksum`	128-bit cryptographic message digest
`input_string`	Data to be hashed
`checksum_ string`	128-bit cryptographic message digest

63

DBMS_ODCI

`DBMS_ODCI` package contains a single user function related to the use of Data Cartridges.

See Also:

- *Oracle Database Data Cartridge Developer's Guide*

This chapter contains the following topic:

Summary of DBMS_ODCI Subprograms

Table 63–1 DBMS_ODCI Package Subprograms

Subprogram	Description
ESTIMATE_CPU_UNITS Function on page 63-3	Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)

ESTIMATE_CPU_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE_CPU_UNITS considers the speed of a single processor.

Syntax

```
DBMS_ODCI.ESTIMATE_CPU_UNITS(
   elapsed_time     NUMBER)
  RETURN NUMBER;
```

Parameters

Parameter	Description
elapsed_time	The elapsed time in seconds that it takes to execute a function.

Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by ESTIMATE_CPU_UNITS; multiply the number returned by ESTIMATE_CPU_UNITS by 1,000.

64

DBMS_OFFLINE_OG

The `DBMS_OFFLINE_OG` package contains the public interface for offline instantiation of master groups.

This chapter contains the following topics:

Documentation of DBMS_OFFLINE_OG

For a complete description of this package within the context of Replication, see DBMS_OFFLINE_OG in the *Oracle Database Advanced Replication Management API Reference*.

65

DBMS_OLAP

Note: With Oracle Database 10*g*, the DBMS_OLAP package has been replaced with improved technology. While Oracle recommends you not begin development using DBMS_OLAP, Oracle continues to support DBMS_OLAP, and your existing applications using DBMS_OLAP will continue to work.

- If you are developing new or substantially modified applications and had previously used the Summary Advisor in DBMS_OLAP, you should now use the SQL Access Advisor described in Chapter 12, "DBMS_ADVISOR".
- If you had previously used DBMS_OLAP.VALIDATE_DIMENSION, you should now use DBMS_DIMENSION.VALIDATE_DIMENSION described in Chapter 35, "DBMS_DIMENSION".
- If you had previously used DBMS_OLAP.ESTIMATE_MVIEW_SIZE, you should now use DBMS_MVIEW.ESTIMATE_MVIEW_SIZE described in Chapter 61, "DBMS_MVIEW".

The DBMS_OLAP package, presented here for reasons of backward compatibility, provides a collection of materialized view analysis and advisory functions that are callable from any PL/SQL program. Some of the functions generate output tables.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information.

This chapter contains the following topics:

Using DBMS_OLAP

This section contains topics which relate to using the `DBMS_OLAP` package.

Overview

DBMS_OLAP performs seven major functions, which include materialized view strategy recommendation, materialized view strategy evaluation, reporting and script generation, repository management, workload management, filter management, and dimension validation.

To perform materialized view strategy recommendation and evaluation functions, the workload information can either be provided by the user or synthesized by the Advisor engine. In the former case, cardinality information of all tables and materialized views referenced in the workload are required. In the latter case, dimension objects must be present and cardinality information for all dimension tables, fact tables, and materialized views are required. Cardinality information should be gathered with the DBMS_STATS.GATHER_TABLE_STATS procedure. Once these functions are completed, the analysis results can be presented with the reporting and script generation function.

The workload management function handles three types of workload, which are user-specified workload, SQL cache workload, and Oracle Trace workload. To process the user-specified workload, a user-defined workload table must be present in the user's schema. To process Oracle Trace workload, the Oracle Trace formatter must be run to preprocess collected workload statistics into default V-tables in the user's schema.

Views

Several views are created when using DBMS_OLAP. All are in the SYSTEM schema. To access these views, you must have a DBA role.

SYSTEM.MVIEW_EVALUATIONS

Table 65–1 SYSTEM.MVIEW_EVALUATIONS

Column	NULL?	Datatype	Description
RUNID	NOT NULL	NUMBER	Run ID identifying a unique Advisor call.
MVIEW_OWNER	-	VARCHAR2(30)	Owner of materialized view.
MVIEW_NAME	-	VARCHAR2(30)	Name of an exiting materialized view in this database.
RANK	NOT NULL	NUMBER	Rank of this materialized view in descending order of BENEFIT_TO_CSOT_RATIO.
STORAGE_IN_BYTES	-	NUMBER	Size of the materialized view in bytes.
FREQUENCY	-	NUMBER	Number of times this materialized view appears in the workload.
CUMULATIVE_BENEFIT	-	NUMBER	The cumulative benefit of the materialized view.
BENEFIT_TO_COST_RATIO	NOT NULL	NUMBER	The ratio of CUMULATIVE_BENEFIT to STORAGE_IN_BYTES.

SYSTEM.MVIEW_EXCEPTIONS

Table 65–2 SYSTEM.MVIEW_EXCEPTIONS

Column	NULL?	Datatype	Description
RUNID	-	NUMBER	Run ID identifying a unique Advisor call.
OWNER	-	VARCHAR2(30)	Owner name.
TABLE_NAME	-	VARCHAR2(30)	Table name.
DIMENSION_NAME	-	VARCHAR2(30)	Dimension name.
RELATIONSHIP	-	VARCHAR2(11)	Violated relation name.
BAD_ROWID	-	ROWID	Location of offending entry.

SYSTEM.MVIEW_FILTER

Table 65–3 SYSTEM.MVIEW_FILTER

Column	NULL?	Datatype	Description
FILTERID	NOT NULL	NUMBER	Unique number used to identify the operation that used this filter.
SUBFILTERNUM	NOT NULL	NUMBER	A unique ID number that groups all filter items together. A corresponding filter header record can be found in the MVIEW_LOG table.
SUBFILTERTYPE	-	VARCHAR2(12)	Filter item number.

Table 65–3 (Cont.) SYSTEM.MVIEW_FILTER

Column	NULL?	Datatype	Description
STR_VALUE	–	VARCHAR2(1028)	String attribute for items that require strings.
NUM_VALUE1	–	NUMBER	Numeric low for items that require numbers.
NUM_VALUE2	–	NUMBER	Numeric high for items that require numbers.
DATE_VALUE1	–	DATE	Date low for items that require dates.
DATE_VALUE2	–	DATE	Date high for items that require dates.

SYSTEM.MVIEW_FILTERINSTANCE

Table 65–4 SYSTEM.MVIEW_FILTERINSTANCE

Column	NULL?	Datatype	Description
RUNID	NOT NULL	NUMBER	Unique number used to identify the operation that used this filter.
FILTERID	–	NUMBER	A unique ID number that groups all filter items together. A corresponding filter header record can be found in the MVIEW_LOG table.
SUBFILTERNUM	–	NUMBER	Filter item number.
SUBFILTERTYPE	–	VARCHAR2(12)	Filter item type.
STR_VALUE	–	VARCHAR2(1028)	String attribute for items that require strings.
NUM_VALUE1	–	NUMBER	Numeric low for items that require numbers.
NUM_VALUE2	–	NUMBER	Numeric high for items that require numbers.
DATE_VALUE1	–	DATE	Date low for items that require dates.
DATE_VALUE2	–	DATE	Date high for items that require dates.

SYSTEM.MVIEW_LOG

Table 65–5 SYSTEM.MVIEW_LOG

Column	NULL?	Datatype	Description
ID	NOT NULL	NUMBER	Unique number used to identify the table entry. The number must be created using the CREATE_ID routine.
FILTERID	–	NUMBER	Optional filter ID. Zero indicates no user-supplied filter has been applied to the operation.
RUN_BEGIN	–	DATE	Date at which the operation began.
RUN_END	–	DATE	Date at which the operation ended.
TYPE	–	VARCHAR2(11)	A name that identifies the type of operation.
STATUS	–	VARCHAR2(11)	The current operational status.
MESSAGE	–	VARCHAR2(2000)	Informational message indicating current operation or condition.
COMPLETED	–	NUMBER	Number of steps completed by operation.
TOTAL	–	NUMBER	Total number steps to be performed.
ERROR_CODE	–	VARCHAR2(20)	Oracle error code in the event of an error.

SYSTEM.MVIEW_RECOMMENDATIONS

Table 65–6 SYSTEM.MVIEW_RECOMMENDATIONS

Column	NULL?	Datatype	Description
RUNID	-	NUMBER	Run ID identifying a unique Advisor call.
ALL_TABLES	-	VARCHAR2(2000)	A comma-delimited list of fully qualified table names for structured recommendations.
FACT_TABLES	-	VARCHAR2(1000)	A comma-delimited list of grouping levels, if any, for structured recommendation.
GROUPING_LEVELS	-	VARCHAR2(2000)	-
QUERY_TEXT	-	LONG	Query text of materialized view if RECOMMENDED_ACTION is CREATE; null otherwise.
RECOMMENDATION_NUMBER	NOT NULL	NUMBER	Unique identifier for this recommendation.
RECOMMENDED_ACTION	-	VARCHAR2(6)	CREATE, RETAIN, or DROP.
MVIEW_OWNER	-	VARCHAR2(30)	Owner of the materialized view if RECOMMENDED_ACTION is RETAIN or DROP; null otherwise.
MVIEW_NAME	-	VARCHAR2(30)	Name of the materialized view if RECOMMENDED_ACTION is RETAIN or DROP; null otherwise.
STORAGE_IN_BYTES	-	NUMBER	Actual or estimated storage in bytes.
PCT_PERFORMANCE_GAIN	-	NUMBER	The expected incremental improvement in performance obtained by accepting this recommendation relative to the initial condition, assuming that all previous recommendations have been accepted, or NULL if unknown.
BENEFIT_TO_COST_RATIO	NOT NULL	NUMBER	Ratio of the incremental improvement in performance to the size of the materialized view in bytes, or NULL if unknown.

SYSTEM.MVIEW_WORKLOAD

Table 65–7 SYSTEM.MVIEW_WORKLOAD

Column	NULL?	Datatype	Description
APPLICATION	-	VARCHAR2(30)	Optional application name for the query.
CARDINALITY	-	NUMBER	Total cardinality of all of tables in query.
WORKLOADID	-	NUMBER	Workload ID identifying a unique sampling.
FREQUENCY	-	NUMBER	Number of times query executed.
IMPORT_TIME	-	DATE	Date at which item was collected.
LASTUSE	-	DATE	Last date of execution.
OWNER	-	VARCHAR2(30)	User who last executed query.
PRIORITY	-	NUMBER	User-supplied ranking of query.
QUERY	-	LONG	Query text.

Table 65–7 (Cont.) SYSTEM.MVIEW_WORKLOAD

Column	NULL?	Datatype	Description
QUERYID	-	NUMBER	Id number identifying a unique query.
RESPONSETIME	-	NUMBER	Execution time in seconds.
RESULTSIZE	-	NUMBER	Total bytes selected by the query.

Deprecated Subprograms

The DBMS_OLAP subprograms have been replaced with improved technology: see Chapter 12, "DBMS_ADVISOR", Chapter 35, "DBMS_DIMENSION" and Chapter 61, "DBMS_MVIEW". All DBMS_OLAP subprograms are obsolete with Oracle Database 10g, and while Oracle will continue to support them, they are documented only for reasons of backward compatibility.

- ADD_FILTER_ITEM Procedure
- CREATE_ID Procedure
- ESTIMATE_MVIEW_SIZE Procedure
- EVALUATE_MVIEW_STRATEGY Procedure
- GENERATE_MVIEW_REPORT Procedure
- GENERATE_MVIEW_SCRIPT Procedure
- LOAD_WORKLOAD_CACHE Procedure
- LOAD_WORKLOAD_TRACE Procedure
- PURGE_FILTER Procedure
- PURGE_RESULTS Procedure
- PURGE_WORKLOAD Procedure
- RECOMMEND_MVIEW_STRATEGY Procedure
- SET_CANCELLED Procedure
- VALIDATE_DIMENSION Procedure
- VALIDATE_WORKLOAD_CACHE Procedure
- VALIDATE_WORKLOAD_TRACE Procedure
- VALIDATE_WORKLOAD_USER Procedure

Summary of DBMS_OLAP Subprograms

Note: The DBMS_OLAP subprograms have been replaced with improved technology:

- If you are developing new or substantially modified applications and had previously used the Summary Advisor in DBMS_OLAP, you should now use the SQL Access Advisor described in Chapter 12, "DBMS_ADVISOR".
- If you had previously used DBMS_OLAP.VALIDATE_DIMENSION, you should now use DBMS_DIMENSION.VALIDATE_DIMENSION described in Chapter 35, "DBMS_DIMENSION".
- If you had previously used DBMS_OLAP.ESTIMATE_MVIEW_SIZE, you should now use DBMS_MVIEW.ESTIMATE_MVIEW_SIZE described in Chapter 61, "DBMS_MVIEW"

Table 65–8 DBMS_OLAP Package Subprograms

Subprogram	Description
ADD_FILTER_ITEM Procedure on page 65-11	Filters the contents being used during the recommendation process [see Deprecated Subprograms on page 65-8]
CREATE_ID Procedure on page 65-13	Generates an internal ID used by a new workload collection, a new filter, or a new Advisor run [see Deprecated Subprograms on page 65-8]
ESTIMATE_MVIEW_SIZE Procedure on page 65-14	Estimates the size of a materialized view that you might create, in bytes and rows [see Deprecated Subprograms on page 65-8]
EVALUATE_MVIEW_STRATEGY Procedure on page 65-15	Measures the utilization of each existing materialized view [see Deprecated Subprograms on page 65-8]
GENERATE_MVIEW_REPORT Procedure on page 65-16	Generates an HTML-based report on the given Advisor run [see Deprecated Subprograms on page 65-8]
GENERATE_MVIEW_SCRIPT Procedure on page 65-17	Generates a simple script containing the SQL commands to implement Summary Advisor recommendations [see Deprecated Subprograms on page 65-8]
LOAD_WORKLOAD_CACHE Procedure on page 65-18	Obtains a SQL cache workload [see Deprecated Subprograms on page 65-8]
LOAD_WORKLOAD_TRACE Procedure on page 65-19	Loads a workload collected by Oracle Trace [see Deprecated Subprograms on page 65-8]
LOAD_WORKLOAD_USER Procedure on page 65-20	Loads a user-defined workload [see Deprecated Subprograms on page 65-8]
PURGE_FILTER Procedure on page 65-21	Deletes a specific filter or all filters [see Deprecated Subprograms on page 65-8]
PURGE_RESULTS Procedure on page 65-22	Removes all results or those for a specific run [see Deprecated Subprograms on page 65-8]
PURGE_WORKLOAD Procedure on page 65-23	Deletes all workloads or a specific collection [see Deprecated Subprograms on page 65-8]

Table 65–8 (Cont.) DBMS_OLAP Package Subprograms

Subprogram	Description
RECOMMEND_MVIEW_STRATEGY Procedure on page 65-24	Generates a set of recommendations about which materialized views should be created, retained, or dropped [see Deprecated Subprograms on page 65-8]
SET_CANCELLED Procedure on page 65-26	Stops the Advisor if it takes too long returning results [see Deprecated Subprograms on page 65-8]
VALIDATE_DIMENSION Procedure on page 65-27	Verifies that the relationships specified in a `dimension` are correct [see Deprecated Subprograms on page 65-8]
VALIDATE_WORKLOAD_CACHE Procedure on page 65-28	Validates the SQL Cache workload before performing load operations [see Deprecated Subprograms on page 65-8]
VALIDATE_WORKLOAD_TRACE Procedure on page 65-29	Validates the Oracle Trace workload before performing load operations [see Deprecated Subprograms on page 65-8]
VALIDATE_WORKLOAD_USER Procedure on page 65-30	Validates the user-supplied workload before performing load operations [see Deprecated Subprograms on page 65-8]

ADD_FILTER_ITEM Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure adds a new filter item to an existing filter to make it more restrictive. It also creates a filter to restrict what is analyzed for the workload.

Syntax

```
ADD_FILTER_ITEM (
   filter_id    IN NUMBER,
   filter_name  IN VARCHAR2,
   string_list  IN VARCHAR2,
   number_min   IN NUMBER,
   number_max   IN NUMBER,
   date_min     IN VARCHAR2,
   date_max     IN VARCHAR2);
```

Parameters

Table 65–9 ADD_FILTER_ITEM Procedure Parameters

Parameter	Description
filter_id	An ID that uniquely describes the filter. It is generated by the DBMS_OLAP.CREATE_ID procedure
filter_name	■ APPLICATION: String-workloads application column. An example of how to load a SQL Cache workload follows. ■ BASETABLE: String-based tables referenced by workload queries. Name must be fully qualified including owner and table name (for example, SH.SALES). ■ CARDINALITY: Numerical-sum of cardinality of the referenced base tables. ■ FREQUENCY: Numerical-workloads frequency column. ■ LASTUSE: Date-workloads lastuse column. Not used by SQL Cache workload. ■ OWNER: String-workloads owner column. Expected in uppercase unless owner defined explicitly to be not all in uppercase. ■ PRIORITY: Numerical-workloads priority column. Not used by SQL Cache workload. ■ RESPONSETIME: Numerical-workloads response time column. Not used by SQL Cache workload. ■ SCHEMA: String-based schema referenced by workload filter. ■ TRACENAME: String-list of oracle trace collection names. Only used by a Trace Workload.
string_list	A comma-delimited list of strings. This parameter is only used by the filter items of the string type.
number_min	The lower bound of a numerical range. NULL represents the lowest possible value. This parameter is only used by the parameters of the numerical type.
number_max	The upper bound of a numerical range, NULL for no upper bound. NULL represents the highest possible value. This parameter is only used by the parameters of the numerical type.

Table 65–9 (Cont.) ADD_FILTER_ITEM Procedure Parameters

Parameter	Description
`date_min`	The lower bound of a date range. `NULL` represents the lowest possible date value. This parameter is only used by the parameters of the date type.
`date_max`	The upper bound of a date range. `NULL` represents the highest possible date value. This parameter is only used by the parameters of the date type.

CREATE_ID Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure creates a unique identifier, which is used to identify a filter, a workload or results of an Advisor or dimension validation run.

Syntax

```
CALL DBMS_OLAP.CREATE_ID (
  id        OUT NUMBER);
```

Parameters

Table 65–10 CREATE_ID Procedure Parameters

Parameter	Description
id	The unique identifier that can be used to identify a filter, a workload, or an Advisor run

ESTIMATE_MVIEW_SIZE Procedure

Note: See Deprecated Subprograms on page 65-8.

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_OLAP.ESTIMATE_MVIEW_SIZE (
   stmt_id       IN  VARCHAR2,
   select_clause IN  VARCHAR2,
   num_rows      OUT NUMBER,
   num_bytes     OUT NUMBER);
```

Parameters

Table 65–11 ESTIMATE_MVIEW_SIZE Procedure Parameters

Parameter	Description
stmt_id	Arbitrary string used to identify the statement in an EXPLAIN PLAN
select_clause	The SELECT statement to be analyzed
num_rows	Estimated cardinality
num_bytes	Estimated number of bytes

EVALUATE_MVIEW_STRATEGY Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure measures the utilization of each existing materialized view based on the materialized view usage statistics collected from the workload. The `workload_id` is optional. If not provided, `EVALUATE_MVIEW_STRATEGY` uses a hypothetical workload.

Syntax

```
DBMS_OLAP.EVALUATE_MVIEW_STRATEGY (
run_id        IN NUMBER,
workload_id   IN NUMBER,
filter_id     IN NUMBER);
```

Parameters

Table 65–12 EVALUATE_MVIEW_STRATEGY Procedure Parameters

Parameter	Description
`run_id`	An ID generated by the `DBMS_OLAP.CREATE_ID` procedure to identify results of a run
`workload_id`	An optional workload ID that maps to a workload in the current repository. Use the parameter `DBMS_OLAP.WORKLOAD_ALL` to choose all workloads.
`filter_id`	Specify filter for the workload to be used. The value `DBMS_OLAP.FILTER_NONE` indicates no filtering.

Usage Notes

Periodically, the unused results can be purged from the system by calling the `DBMS_OLAP.PURGE_RESULTS` procedure.

GENERATE_MVIEW_REPORT Procedure

Note: See Deprecated Subprograms on page 65-8.

This procedure generates an HTML-based report on the given Advisor run.

Syntax

```
DBMS_OLAP.GENERATE_MVIEW_REPORT (
   filename     IN VARCHAR2,
   id           IN NUMBER,
   flags        IN NUMBER);
```

Parameters

Table 65–13 GENERATE_MVIEW_REPORT Procedure Parameters

Parameter	Description
filename	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permissions.
id	An ID that identifies an Advisor run. Or use the parameter DBMS_OLAP.RUNID_ALL to indicate all Advisor runs should be reported.
flags	Bit masked flags indicating what sections should be reported ■ DBMS_OLAP.RPT_ACTIVITY -- Overall activities ■ DBMS_OLAP.RPT_JOURNAL -- Runtime journals ■ DBMS_OLAP.RPT_WORKLOAD_FILTER -- Filters ■ DBMS_OLAP.RPT_WORKLOAD_DETAIL -- Workload information ■ DBMS_OLAP.RPT_WORKLOAD_QUERY -- Workload query information ■ DBMS_OLAP.RPT_RECOMMENDATION -- Recommendations ■ DBMS_OLAP.RPT_USAGE -- Materialized view usage ■ DBMS_OLAP.RPT_ALL -- All sections

GENERATE_MVIEW_SCRIPT Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure generates a simple script containing the SQL commands to implement Summary Advisor recommendations.

Syntax

```
DBMS_OLAP.GENERATE_MVIEW_SCRIPT(
   filename      IN VARCHAR2,
   id            IN NUMBER,
   tspace        IN VARCHAR2);
```

Parameters

Table 65–14 GENERATE_MVIEW_SCRIPT Procedure Parameters

Parameter	Description
`filename`	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permissions.
`id`	An ID that identifies an Advisor run. The parameter `DBMS_OLAP.RUNID_ALL` indicates all Advisor runs should be reported.
`tspace`	Optional tablespace name to use when creating materialized views.

LOAD_WORKLOAD_CACHE Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure loads a SQL cache workload.

Syntax

```
DBMS_OLAP.LOAD_WORKLOAD_CACHE (
   workload_id  IN NUMBER,
   flags        IN NUMBER,
   filter_id    IN NUMBER,
   application  IN VARCHAR2,
   priority     IN NUMBER);
```

Parameters

Table 65–15 LOAD_WORKLOAD_CACHE Procedure Parameters

Parameter	Description
workload_id	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permission.
flags	■ DBMS_OLAP.WORKLOAD_OVERWRITE: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID. ■ DBMS_OLAP.WORKLOAD_APPEND: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload. ■ DBMS_OLAP.WORKLOAD_NEW: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error. Note: the flags have the same behavior irrespective of the LOAD_WORKLOAD operation.
filter_id	Specify filter for the workload to be loaded
application	The default business application name. This value will be used for a query if one is not found in the target workload.
priority	The default business priority to be assigned to every query in the target workload

LOAD_WORKLOAD_TRACE Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure loads an Oracle Trace workload.

Syntax

```
DBMS_OLAP.LOAD_WORKLOAD_TRACE (
   workload_id  IN NUMBER,
   flags        IN NUMBER,
   filter_id    IN NUMBER,
   application  IN VARCHAR2,
   priority     IN NUMBER,
   owner_name   IN VARCHAR2);
```

Parameters

Table 65–16 LOAD_WORKLOAD_TRACE Procedure Parameters

Parameter	Description
collectionid	Fully qualified output file name to receive HTML data. Note that the Oracle server restricts file access within Oracle stored procedures. See the "Security and Performance" section of the Java Developer's Guide for more information on file permission.
flags	■ DBMS_OLAP.WORKLOAD_OVERWRITE: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID. ■ DBMS_OLAP.WORKLOAD_APPEND: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload. ■ DBMS_OLAP.WORKLOAD_NEW: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error. Note: the flags have the same behavior irrespective of the LOAD_WORKLOAD operation.
filter_id	Specify filter for the workload to be loaded
application	The default business application name. This value will be used for a query if one is not found in the target workload.
priority	The default business priority to be assigned to every query in the target workload
owner_name	The schema that contains the Oracle Trace data. If omitted, the current user will be used

LOAD_WORKLOAD_USER Procedure

Note: See Deprecated Subprograms on page 65-8.

This procedure loads a user-defined workload.

Syntax

```
DBMS_OLAP.LOAD_WORKLOAD_USER (
   workload_id   IN    NUMBER,
   flags         IN    NUMBER,
   filter_id     IN    NUMBER,
   owner_name    IN    VARCHAR2,
   table_name    IN    VARCHAR2);
```

Parameters

Table 65–17 LOAD_WORKLOAD_USER Procedure Parameters

Parameter	Description
workload_id	The required id that was returned by the DBMS_OLAP.CREATE_ID call
flags	■ DBMS_OLAP.WORKLOAD_OVERWRITE: The load routine will explicitly remove any existing queries from the workload that are owned by the specified collection ID ■ DBMS_OLAP.WORKLOAD_APPEND: The load routine preserves any existing queries in the workload. Any queries collected by the load operation will be appended to the end of the specified workload ■ DBMS_OLAP.WORKLOAD_NEW: The load routine assumes there are no existing queries in the workload. If it finds an existing workload element, the call will fail with an error Note: the flags have the same behavior irrespective of the LOAD_WORKLOAD operation.
filter_id	Specify filter for the workload to be loaded
owner_name	The schema that contains the user supplied table or view
table_name	The table or view name containing valid workload data

PURGE_FILTER Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure removes a filter at any time. You can delete a specific filter or all filters.

Syntax

```
DBMS_OLAP.PURGE_FILTER (
   filter_id    IN    NUMBER);
```

Parameters

Table 65–18 PURGE_FILTER Procedure Parameters

Parameter	Description
`filter_id`	The parameter `DBMS_OLAP.FILTER_ALL` indicates all filters should be removed.

PURGE_RESULTS Procedure

Note: See Deprecated Subprograms on page 65-8.

Many procedures in the DBMS_OLAP package generate output in system tables, such as recommendation results for RECOMMEND_MVIEW_STRATEGY and evaluation results for EVALUATE_MVIEW_STRATEGY, and dimension validation results for VALIDATE_DIMENSION. When these outputs are no longer required, they should be removed using the procedure PURGE_RESULTS. You can remove all results or those for a specific run.

Syntax

```
DBMS_OLAP.PURGE_RESULTS (
   run_id    IN   NUMBER);
```

Parameters

Table 65–19 PURGE_RESULTS Procedure Parameters

Parameter	Description
run_id	An ID generated with the DBMS_OLAP.CREATE_ID procedure. The ID should be associated with a RECOMMEND_MVIEW_STRATEGY or a EVALUATE_MVIEW_STRATEGY or a VALIDATE_DIMENSION run. Use the value DBMS_OLAP.RUNID_ALL to specify all such runs.

PURGE_WORKLOAD Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure removes workloads when they are no longer needed. You can delete all workloads or a specific collection.

Syntax

```
DBMS_OLAP.PURGE_WORKLOAD (
   workload_id   IN   NUMBER);
```

Parameters

Table 65–20 PURGE_WORKLOAD Procedure Parameters

Parameter	Description
workload_id	An ID number originally assigned by the create_id call. If the value of workload_id is set to DBMS_OLAP.WORKLOAD_ALL, then all workloads for the current user will be deleted.

RECOMMEND_MVIEW_STRATEGY Procedure

Note: See Deprecated Subprograms on page 65-8.

This procedure generates a set of recommendations about which materialized views should be created, retained, or dropped, based on information in the workload (gathered by Oracle Trace, the user workload, or the SQL cache), and an analysis of table and column cardinality statistics gathered by the DBMS_STATS.GATHER_TABLE_STATS procedure.

RECOMMEND_MVIEW_STRATEGY requires that you have run the GATHER_TABLE_STATS procedure to gather table and column cardinality statistics and have collected and formatted the workload statistics.

The workload is aggregated to determine the count of each request in the workload, and this count is used as a weighting factor during the optimization process. If the workload_id is not provided, then RECOMMEND_MVIEW_STRATEGY uses a hypothetical workload based on dimension definitions and other embedded statistics.

The space of all dimensional materialized views that include the specified fact tables identifies the set of materialized views that optimize performance across the workload. The recommendation results are stored in system tables, which can be accessed through the view SYSTEM.MVIEW_RECOMMENDATIONS.

Syntax

```
DBMS_OLAP.RECOMMEND_MVIEW_STRATEGY (
   run_id             IN  NUMBER,
   workload_id        IN  NUMBER,
   filter_id          IN  NUMBER,
   storage_in_bytes   IN  NUMBER,
   retention_pct      IN  NUMBER,
   retention_list     IN  VARCHAR2,
   fact_table_filter  IN  VARCHAR2);
```

Parameters

Table 65–21 RECOMMEND_MVIEW_STRATEGY Procedure Parameters

Parameter	Description
run_id	An ID generated by the DBMS_OLAP.CREATE_ID procedure to uniquely identify results of a run
workload_id	An optional workload ID that maps to a workload in the current repository. Use the parameter DBMS_OLAP.WORKLOAD_ALL to choose all workloads. If the workload_id is set to NULL, the call will use a hypothetical workload.
filter_id	An optional filter ID that maps to a set of user-supplied filter items. Use the parameter DBMS_OLAP.FILTER_NONE to avoid filtering.
storage_in_bytes	Maximum storage, in bytes, that can be used for storing materialized views. This number must be nonnegative.

Table 65–21 (Cont.) RECOMMEND_MVIEW_STRATEGY Procedure Parameters

Parameter	Description
retention_pct	Number between 0 and 100 that specifies the percent of existing materialized view storage that must be retained, based on utilization on the actual or hypothetical workload. A materialized view is retained if the cumulative space, ranked by utilization, is within the retention threshold specified (or if it is explicitly listed in retention_list). Materialized views that have a NULL utilization (for example, nondimensional materialized views) are always retained.
retention_list	A comma-delimited list of materialized view table names. A drop recommendation is not made for any materialized view that appears in this list.
fact_table_filter	Optional list of fact tables used to filter real or ideal workload

Usage Notes

Periodically, the unused results can be purged from the system by calling the PURGE_RESULTS procedure.

SET_CANCELLED Procedure

Note: See Deprecated Subprograms on page 65-8.

If the Summary Advisor takes too long to make its recommendations using the procedures `RECOMMEND_MVIEW_STRATEGY`, you can stop it by calling the procedure `SET_CANCELLED` and passing in the `run_id` for this recommendation process.

Syntax

```
DBMS_OLAP.SET_CANCELLED (
   run_id     IN  NUMBER);
```

Parameters

Table 65–22 SET_CANCELLED Procedure Parameters

Parameter	Description
`run_id`	ID that uniquely identifies an Advisor analysis operation. This call can be used to cancel a long running workload collection as well as an Advisor analysis session

VALIDATE_DIMENSION Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure verifies that the hierarchical and attribute relationships, and join relationships, specified in an existing dimension object are correct. This provides a fast way to ensure that referential integrity is maintained.

The validation results are stored in system tables, which can be accessed through the view SYSTEM.MVIEW_EXCEPTIONS.

Syntax

```
DBMS_OLAP.VALIDATE_DIMENSION (
   dimension_name    IN VARCHAR2,
   dimension_owner   IN VARCHAR2,
   incremental       IN BOOLEAN,
   check_nulls       IN BOOLEAN,
   run_id            IN NUMBER);
```

Parameters

Table 65–23 VALIDATE_DIMENSION Procedure Parameters

Parameter	Description
dimension_name	Name of the dimension to analyze
dimension_owner	Name of the dimension owner
incremental	If TRUE, then tests are performed only for the rows specified in the sumdelta$ table for tables of this dimension; otherwise, check all rows.
check_nulls	■ If TRUE, then all level columns are verified to be non-NULL; otherwise, this check is omitted. ■ Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.
run_id	An ID generated by the DBMS_OLAP.CREATE_ID procedure to identify a run

Usage Notes

Periodically, the unused results can be purged from the system by calling the PURGE_RESULTS procedure.

VALIDATE_WORKLOAD_CACHE Procedure

Note: See Deprecated Subprograms on page 65-8.

This procedure validates the SQL Cache workload before performing load operations.

Syntax

```
DBMS_OLAP.VALIDATE_WORKLOAD_CACHE (
   valid            OUT NUMBER,
   error            OUT VARCHAR2);
```

Parameters

Table 65–24 VALIDATE_WORKLOAD_USER Procedure Parameters

Parameter	Description
valid	Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID. Indicates whether a workload is valid
error	VARCHAR2, return error set

VALIDATE_WORKLOAD_TRACE Procedure

> **Note:** See Deprecated Subprograms on page 65-8.

This procedure validates the Oracle Trace workload before performing load operations.

Syntax

```
DBMS_OLAP.VALIDATE_WORKLOAD_TRACE (
   owner_name       IN  VARCHAR2,
   valid            OUT NUMBER,
   error            OUT VARCHAR2);
```

Parameters

Table 65–25 VALIDATE_WORKLOAD_TRACE Procedure Parameters

Parameter	Description
owner_name	Owner of the trace workload table
valid	Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID. Indicates whether a workload is valid.
error	VARCHAR2, return error text

VALIDATE_WORKLOAD_USER Procedure

Note: See Deprecated Subprograms on page 65-8.

This procedure validates the user-supplied workload before performing load operations.

Syntax

```
DBMS_OLAP.VALIDATE_WORKLOAD_USER (
   owner_name       IN  VARCHAR2,
   table_name       IN  VARCHAR2,
   valid            OUT NUMBER,
   error            OUT VARCHAR2);
```

Parameters

Table 65–26 VALIDATE_WORKLOAD_USER Procedure Parameters

Parameter	Description
owner_name	Owner of the user workload table
table_name	User workload table name
valid	Return DBMS_OLAP.VALID or DBMS_OLAP.INVALID Indicate whether a workload is valid.
error	VARCHAR2, return error set

66

DBMS_OUTLN

The DBMS_OUTLN package, synonymous with OUTLN_PKG, contains the functional interface for subprograms associated with the management of stored outlines.

> **See Also:** For more information about using the DBMS_OUTLN package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

This chapter contains the following topics:

Using DBMS_OUTLN

Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline.The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

Summary of DBMS_OUTLN Subprograms

Table 66–1 DBMS_OUTLN Package Subprograms

Subprogram	Description
CLEAR_USED Procedure on page 66-6	Clears the outline 'used' flag
CREATE_OUTLINE Procedure on page 66-7	Generates outlines from the shared cursor identified by hash value and child number
DROP_BY_CAT Procedure on page 66-8	Drops outlines that belong to a specified category
DROP_UNUSED Procedure on page 66-9	Drops outlines that have never been applied in the compilation of a SQL statement
EXACT_TEXT_SIGNATURES Procedure on page 66-10	Updates outline signatures to those that compute based on exact text matching
UPDATE_BY_CAT Procedure on page 66-11	Changes the category of outlines in one category to a new category
UPDATE_SIGNATURES Procedure on page 66-12	Updates outline signatures to the current version's signature

CLEAR_USED Procedure

This procedure clears the outline 'used' flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (
   name     IN     VARCHAR2);
```

Parameters

Table 66–2 CLEAR_USED Procedure Parameters

Parameter	Description
name	Name of the outline.

CREATE_OUTLINE Procedure

This procedure generates an outline from the shared cursor identified by hash value and child number.

Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (
   hash_value    IN NUMBER,
   child_number  IN NUMBER,
   category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

Parameters

Table 66–3 CREATE_OUTLINE Procedure Parameters

Parameter	Description
hash_value	Hash value identifying the target shared cursor.
child_number	Child number of the target shared cursor.
category	Category in which to create outline (optional).

DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the DEFAULT category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

```
DBMS_OUTLN.DROP_BY_CAT (
   cat VARCHAR2);
```

Parameters

Table 66–4 DROP_BY_CAT Procedure Parameters

Parameter	Description
cat	Category of outlines to drop.

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the DEFAULT category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

```
DBMS.OUTLN.EXACT_TEXT_SIGNATURES;
```

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

UPDATE_BY_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

Syntax

```
DBMS.OUTLN.UPDATE_BY_CAT (
   oldcat    VARCHAR2 default 'DEFAULT',
   newcat    VARCHAR2 default 'DEFAULT');
```

Parameters

Table 66–5 UPDATE_BY_CAT Procedure Parameters

Parameter	Description
`oldcat`	The current category of outlines.
`newcat`	The new category of outlines.

UPDATE_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

Syntax

```
DBMS.OUTLN.UPDATE_SIGNATURES;
```

Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

67

DBMS_OUTLN_EDIT

The `DBMS_OUTLN_EDIT` package is an invoker's rights package.

> **See Also:** For more information about using the `DBMS_OUTLN_EDIT` package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

This chapter contains the following topic:

- Summary of DBMS_OUTLN_EDIT Subprograms

Summary of DBMS_OUTLN_EDIT Subprograms

Table 67–1 DBMS_OUTLN_EDIT Package Subprograms

Subprogram	Description
CHANGE_JOIN_POS Procedure on page 67-3	Changes the join position for the hint identified by outline name and hint number to the position specified by `newpos`
CREATE_EDIT_TABLES Procedure on page 67-4	Creates outline editing tables in calling a user's schema
DROP_EDIT_TABLES Procedure on page 67-5	Drops outline editing tables in calling the user's schema
GENERATE_SIGNATURE Procedure on page 67-6	Generates a signature for the specified SQL text
REFRESH_PRIVATE_OUTLINE Procedure on page 67-7	Refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints

CHANGE_JOIN_POS Procedure

This function changes the join position for the hint identified by outline name and hint number to the position specified by `newpos`.

Syntax

```
DBMS_OUTLN_EDIT.CHANGE_JOIN_POS (
   name     VARCHAR2
   hintno   NUMBER
   newpos   NUMBER);
```

Parameters

Table 67–2 CHANGE_JOIN_POS Procedure Parameters

Parameter	Description
`name`	Name of the private outline to be modified.
`hintno`	Hint number to be modified.
`newpos`	New join position for the target hint.

CREATE_EDIT_TABLES Procedure

This procedure creates outline editing tables in calling a user's schema.

Syntax

```
DBMS_OUTLN_EDIT.CREATE_EDIT_TABLES;
```

Usage Notes

Beginning with Oracle Database 10g Release 1 (10.1) you will not need to use this statement because the outline editing tables will already exist as temporary tables in the `SYSTEM` schema.

DROP_EDIT_TABLES Procedure

This procedure drops outline editing tables in calling the user's schema.

Syntax

```
DBMS_OUTLN_EDIT.DROP_EDIT_TABLES;
```

GENERATE_SIGNATURE Procedure

This procedure generates a signature for the specified SQL text.

Syntax

```
DBMS_OUTLN.GENERATE_SIGNATURE (
   sqltxt      IN   VARCHAR2,
   signature   OUT  RAW);
```

Parameters

Table 67–3 GENERATE_SIGNATURE Procedure Parameters

Parameter	Description
sqltxt	The specified SQL.
signature	The signature to be generated.

REFRESH_PRIVATE_OUTLINE Procedure

This procedure refreshes the in-memory copy of the outline, synchronizing its data with the edits made to the outline hints.

Syntax

```
DBMS_OUTLN_EDIT.REFRESH_PRIVATE_OUTLINE (
   name  IN  VARCHAR2);
```

Parameters

Table 67–4 REFRESH_PRIVATE_OUTLINE Procedure Parameters

Parameter	Description
name	Name of the private outline to be refreshed.

68

DBMS_OUTPUT

The DBMS_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

Using DBMS_OUTPUT

This section contains topics which relate to using the `DBMS_OUTPUT` package.

Overview

The package is typically used for debugging, or for displaying messages and reports to SQL*DBA or SQL*Plus (such as are produced by applying the SQL command `DESCRIBE` to procedures).

The PUT Procedure and PUT_LINE Procedure in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the GET_LINE Procedure and GET_LINES Procedure.

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

Operational Notes

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL*Plus, the buffered messages are ignored.
- SQL*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.
- Typing `SET SERVEROUTPUT ON` in SQL*Plus has the effect of invoking

  ```
  DBMS_OUTPUT.ENABLE (buffer_size => NULL);
  ```

  with no limit on the output.
- You should generally avoid having application code invoke either the DISABLE Procedure or ENABLE Procedure because this could subvert the attempt of an external tool like SQL*Plus to control whether or not to display output.

Note: Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

Exceptions

DBMS_OUTPUT subprograms raise the application error ORA-20000, and the output procedures can return the following errors:

Table 68–1 DBMS_OUTPUT Errors

Error	Description
ORU-10027:	Buffer overflow
ORU-10028:	Line length overflow

Rules and Limits

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

Examples

Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here:'||:new.col||' is the new value');
```

If you have enabled the DBMS_OUTPUT package, then the text produced by this PUT_LINE would be buffered, and you could, after executing the statement (presumably some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
   DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to GET_LINE until status comes back as nonzero. For better performance, you should use calls to GET_LINES Procedure which can return an array of lines.

Example 2: Debugging Stored Procedures and Triggers

The DBMS_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in "Example 3: Retrieving Information About an Object" on page 68-9.

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
   CURSOR emp_cursor IS
      SELECT sal, comm FROM emp WHERE deptno = dnum;
   total_wages    NUMBER(11, 2) := 0;
   counter        NUMBER(10) := 1;
BEGIN

   FOR emp_record IN emp_cursor LOOP
      emp_record.comm := NVL(emp_record.comm, 0);
      total_wages := total_wages + emp_record.sal
         + emp_record.comm;
      DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
         '; Wages = '|| TO_CHAR(total_wages));    /* Debug line */
      counter := counter + 1; /* Increment debug counter */
   END LOOP;
   /* Debug line */
   DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
     TO_CHAR(total_wages));
   RETURN total_wages;

END dept_salary;
```

Assume the EMP table contains the following rows:

```
EMPNO          SAL     COMM     DEPT
-----        ------- -------- -------
1002           1500      500       20
1203           1000                30
1289           1000                10
```

```
1347          1000      250      20
```

Assume the user executes the following statements in SQL*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250

PL/SQL procedure successfully executed.
```

Example 3: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```
 /*****************************************************************/
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                 */
/*****************************************************************/
CREATE OR REPLACE PROCEDURE explain_out
   (statement_id IN VARCHAR2) AS

   -- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

   CURSOR explain_rows IS
      SELECT level, id, position, operation, options,
         object_name
      FROM plan_table
      WHERE statement_id = explain_out.statement_id
      CONNECT BY PRIOR id = parent_id
         AND statement_id = explain_out.statement_id
      START WITH id = 0
       ORDER BY id;

BEGIN

   -- Loop through information retrieved from PLAN_TABLE:

   FOR line IN explain_rows LOOP

      -- At start of output, include heading with estimated cost.

      IF line.id = 0 THEN
         DBMS_OUTPUT.PUT_LINE ('Plan for statement '
            || statement_id
            || ', estimated cost = ' || line.position);
      END IF;

      -- Output formatted information. LEVEL determines indention level.

      DBMS_OUTPUT.PUT_LINE (lpad(' ',2*(line.level-1)) ||
```

```
            line.operation || ' ' || line.options || ' ' ||
            line.object_name);
      END LOOP;

END;
```

See Also: Chapter 167, "UTL_FILE"

Data Structures

The DBMS_OUTPUT package declares 2 collection types for use with the GET_LINES Procedure.

TABLE Types

CHARARR Table Type

OBJECT Types

DBMSOUTPUT_LINESARRAY Object Type

CHARARR Table Type

This package type is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

DBMSOUTPUT_LINESARRAY Object Type

This package type is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS
     VARRAY(2147483647) OF VARCHAR2(32767);
```

Summary of DBMS_OUTPUT Subprograms

Table 68–2 DBMS_OUTPUT Package Subprograms

Subprogram	Description
DISABLE Procedure on page 68-15	Disables message output
ENABLE Procedure on page 68-16	Enables message output
GET_LINE Procedure on page 68-17	Retrieves one line from buffer
GET_LINES Procedure on page 68-18	Retrieves an array of lines from buffer
NEW_LINE Procedure on page 68-19	Terminates a line created with `PUT`
PUT Procedure on page 68-20	Places a line in the buffer
PUT_LINE Procedure on page 68-21	Places partial line in buffer

Note: The PUT Procedure that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

DISABLE Procedure

This procedure disables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`, and purges the buffer of any remaining information.

As with the ENABLE Procedure, you do not need to call this procedure if you are using the `SERVEROUTPUT` option of SQL*Plus.

Syntax

```
DBMS_OUTPUT.DISABLE;
```

Pragmas

```
pragma restrict_references(disable,WNDS,RNDS);
```

ENABLE Procedure

This procedure enables calls to PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. Calls to these procedures are ignored if the DBMS_OUTPUT package is not activated.

Syntax

```
DBMS_OUTPUT.ENABLE (
   buffer_size IN INTEGER DEFAULT 20000);
```

Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

Parameters

Table 68–3 ENABLE Procedure Parameters

Parameter	Description
buffer_size	Upper limit, in bytes, the amount of buffered information. Setting buffer_size to NULL specifies that there should be no limit.

Usage Notes

- It is not necessary to call this procedure when you use the SET SERVEROUTPUT option of SQL*Plus.
- If there are multiple calls to ENABLE, then buffer_size is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies buffer_size (NOT NULL).
- NULL is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```
DBMS_OUTPUT.GET_LINE (
   line    OUT VARCHAR2,
   status  OUT INTEGER);
```

Parameters

Table 68–4 GET_LINE Procedure Parameters

Parameter	Description
`line`	Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as `VARCHAR2 (32767)` to avoid the risk of "`ORA-06502`: PL/SQL: numeric or value error: character string buffer too small".
`status`	If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

GET_LINES Procedure

This procedure retrieves an array of lines from the buffer.

Syntax

```
DBMS_OUTPUT.GET_LINES (
   lines       OUT     CHARARR,
   numlines    IN OUT  INTEGER);

DBMS_OUTPUT.GET_LINES (
   lines       OUT     DBMSOUTPUT_LINESARRAY,
   numlines    IN OUT INTEGER);
```

Parameters

Table 68–5 GET_LINES Procedure Parameters

Parameter	Description
`lines`	Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the `VARRAY` overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.
`numlines`	Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

NEW_LINE Procedure

This procedure puts an end-of-line marker. The GET_LINE Procedure and the GET_LINES Procedure return "lines" as delimited by "newlines". Every call to the PUT_LINE Procedure or NEW_LINE Procedure generates a line that is returned by `GET_LINE(S)`.

Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

PUT Procedure

This procedure places a partial line in the buffer.

> **Note:** The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

Parameters

Table 68–6 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 68–7 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

  For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

PUT_LINE Procedure

This procedure places a line in the buffer.

> **Note:** The PUT_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT_LINE (
   item IN VARCHAR2);
```

Parameters

Table 68–8 PUT and PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 68–9 PUT and PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

  For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
   2 DBMS_OUTPUT.PUT_LINE ('hello');
   3 DBMS_LOCK.SLEEP (10);
   4 END;
```

DBMS_PCLXUTIL

The DBMS_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one slave process for each partition is used.

> **See Also:** There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

Using DBMS_PCLXUTIL

Overview

DBMS_PCLXUTIL uses the DBMS_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS_JOB), in combination with intra-partition parallelism using the parallel query slave processes.

DBMS_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS_PCLXUTIL package can be used during the following DBA tasks:

1. Local index creation

   The procedure BUILD_PART_INDEX assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the UNUSABLE option.

   ```
   CREATE INDEX <idx_name> on <tab_name>(...) local(...) unusable;
   ```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure BUILD_PART_INDEX causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

1. Local index maintenance

   By marking desired partitions usable or unusable, the BUILD_PART_INDEX procedure also enables selective rebuilding of local indexes. The force_opt parameter provides a way to override this and build local indexes for all partitions.

   ```
   ALTER INDEX <idx_name> local(...) unusable;
   ```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using force_opt = TRUE:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the DBMS_OUTPUT package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

Operational Notes

DBMS_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the INIT.ORA parameter JOB_QUEUE_PROCESSES correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

Rules and Limits

> **Note:** For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

Because DBMS_PCLXUTIL uses the DBMS_JOB package, you must be aware of the following limitations pertaining to DBMS_JOB:

- You must decide appropriate values for the job_queue_processes initialization parameter. Clearly, if the job processes are not started before calling BUILD_PART_INDEX(), then the package will not function properly. The background processes are specified by the following init.ora parameters:

```
job_queue_processes=n   #the number of background processes = n
```

- Failure conditions are reported only in the trace files (a DBMS_JOB limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the j*.trc trace files.

Summary of DBMS_PCLXUTIL Subprograms

Table 69–1 DBMS_PCLXUTIL Package Subprograms

Subprogram	Description
BUILD_PART_INDEX Procedure on page 69-7	Provides intra-partition parallelism for creating partition-wise local indexes

BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
   jobs_per_batch  IN NUMBER   DEFAULT 1,
   procs_per_job   IN NUMBER   DEFAULT 1,
   tab_name        IN VARCHAR2 DEFAULT NULL,
   idx_name        IN VARCHAR2 DEFAULT NULL,
   force_opt       IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 69–2 BUILD_PART_INDEX Procedure Parameters

Parameter	Description
jobs_per_batch	The number of concurrent partition-wise "local index builds".
procs_per_job	The number of parallel query slaves to be utilized for each local index build (1 <= procs_per_job <= max_slaves).
tab_name	The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).
idx_name	The name given to the local index (an exception is raised if a local index is not created on the table tab_name).
force_opt	If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.

Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD_PART_INDEX(2,4,'PROJECT','IDX',TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

DBMS_PIPE

The DBMS_PIPE package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

Using DBMS_PIPE

Overview

Pipe functionality has several potential applications:

- External service interface: You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- Independent transactions: The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- Alerters (non-transactional): You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "`SELECT FOR UPDATE`" to make sure it read the correct data.
- Debugging: Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- Concentrator: This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either Public Pipes or Private Pipes.

Constants

```
maxwait   constant integer := 86400000; /* 1000 days */
```

This is the maximum time to wait attempting to send or receive a message.

Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

> **Caution: Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.**

The operation of DBMS_PIPE is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the `CREATE_PIPE` function with the `private` flag set to `FALSE`. You must deallocate explicitly-created pipes by calling the `REMOVE_PIPE` function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

Writing and Reading Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have `EXECUTE` permission on the `DBMS_PIPE` package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the `PACK_MESSAGE` procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the `SEND_MESSAGE` function, designating the pipe name to be used to send the message. When `SEND_MESSAGE` is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the `RECEIVE_MESSAGE` function, designating the pipe name from which to receive the message. The process then calls the `UNPACK_MESSAGE` procedure to access each of the items in the message.

Private Pipes

You explicitly create a private pipe by calling the `CREATE_PIPE` function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the `REMOVE_PIPE` function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, CREATE_PIPE returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as SYSDBA

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to PACK_MESSAGE before calling SEND_MESSAGE. Similarly, you must call RECEIVE_MESSAGE to retrieve the message before accessing the items in the message by calling UNPACK_MESSAGE.

Exceptions

DBMS_PIPE package subprograms can return the following errors:

Table 70–1 DBMS_PIPE Errors

Error	Description
ORA-23321:	Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.
ORA-23322:	Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.

Examples

Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status  NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
  DBMS_PIPE.PACK_MESSAGE(msg);
  status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
  IF status != 0 THEN
    raise_application_error(-20099, 'Debug error');
  END IF;
END debug;
```

Example 2: Debugging - Pro*C

The following Pro*C code receives messages from the PLSQL_DEBUG pipe in the previous example, and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
   VARCHAR username[20];
   int     status;
   int     msg_length;
   char    retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{

-- Prepare username:
   strcpy(username.arr, "SCOTT/TIGER");
   username.len = strlen(username.arr);

   EXEC SQL WHENEVER SQLERROR DO sql_error();
   EXEC SQL CONNECT :username;

   printf("connected\n");

-- Start an endless loop to look for and print messages on the pipe:
   FOR (;;)
```

```
   {
      EXEC SQL EXECUTE
         DECLARE
            len INTEGER;
            typ INTEGER;
            sta INTEGER;
            chr VARCHAR2(2000);
         BEGIN
            chr := '';
            sta := dbms_pipe.receive_message('plsql_debug');
            IF sta = 0 THEN
               DBMS_PIPE.UNPACK_MESSAGE(len);
               DBMS_PIPE.UNPACK_MESSAGE(chr);
            END IF;
            :status := sta;
            :retval := chr;
            IF len IS NOT NULL THEN
               :msg_length := len;
            ELSE
               :msg_length := 2000;
            END IF;
         END;
      END-EXEC;
      IF (status == 0)
         printf("\n%.*s\n", msg_length, retval);
      ELSE
         printf("abnormal status, value is %d\n", status);
   }
}

void sql_error()
{
   char msg[1024];
   int rlen, len;
   len = sizeof(msg);
   sqlglm(msg, &len, &rlen);
   printf("ORACLE ERROR\n");
   printf("%.*s\n", rlen, msg);
   exit(1);
}
```

Example 3: Execute System Commands

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the *system*() call or executing a SQL command using embedded SQL.

`DAEMON.SQL` is the source code for the PL/SQL package. This package contains procedures that use the `DBMS_PIPE` package to send and receive message to and from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the `STOP` command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```

On a UNIX system, this causes the Pro*C daemon to execute the command *system*("*ls -la*").

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                       timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
  RETURN NUMBER IS

    status       NUMBER;
    result       VARCHAR2(20);
    command_code NUMBER;
    pipe_name    VARCHAR2(30);
  BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SYSTEM');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20010,
        'Execute_system: Error while sending.  Status = ' ||
         status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20011,
        'Execute_system: Error while receiving.
         Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
```

```
    RAISE_APPLICATION_ERROR(-20012,
      'Execute_system: Done not received.');
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(command_code);
  DBMS_OUTPUT.PUT_LINE('System command executed.  result = ' ||
                       command_code);
  RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
                     timeout NUMBER DEFAULT 10)
RETURN NUMBER IS

  status       NUMBER;
  result       VARCHAR2(20);
  command_code NUMBER;
  pipe_name    VARCHAR2(30);

BEGIN
  pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

  DBMS_PIPE.PACK_MESSAGE('SQL');
  DBMS_PIPE.PACK_MESSAGE(pipe_name);
  DBMS_PIPE.PACK_MESSAGE(command);
  status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20020,
      'Execute_sql: Error while sending.  Status = ' || status);
  END IF;

  status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20021,
      'execute_sql: Error while receiving.
       Status = ' || status);
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(result);
  IF result <> 'done' THEN
    RAISE_APPLICATION_ERROR(-20022,
      'execute_sql: done not received.');
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(command_code);
  DBMS_OUTPUT.PUT_LINE
      ('SQL command executed.  sqlcode = ' || command_code);
  RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
  status NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE('STOP');
  status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20030,
      'stop: error while sending.  status = ' || status);
  END IF;
```

```
  END stop;
END daemon;
```

daemon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.

> **Note:** To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics
```

Then C-compile and link in the normal way.

```
#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
  char *uid = "scott/tiger";
  int status;
  VARCHAR command[20];
  VARCHAR value[2000];
  VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlglm(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while connecting:\n");
  printf("%.*s\n", msg_length, msg_buffer);
  printf("Daemon quitting.\n");
  exit(1);
}

void
sql_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlglm(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while executing:\n");
  printf("%.*s\n", msg_length, msg_buffer);
  printf("Daemon continuing.\n");
}
main()
{
command.len = 20; /*initialize length components*/
```

```
value.len = 2000;
return_name.len  = 30;
  EXEC SQL WHENEVER SQLERROR DO connect_error();
  EXEC SQL CONNECT :uid;
  printf("Daemon connected.\n");

  EXEC SQL WHENEVER SQLERROR DO sql_error();
  printf("Daemon waiting...\n");
  while (1) {
    EXEC SQL EXECUTE
      BEGIN
        :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
        IF :status = 0 THEN
          DBMS_PIPE.UNPACK_MESSAGE(:command);
        END IF;
      END;
    END-EXEC;
    IF (status == 0)
    {
      command.arr[command.len] = '\0';
      IF (!strcmp((char *) command.arr, "STOP"))
      {
        printf("Daemon exiting.\n");
        break;
      }

      ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
      {
        EXEC SQL EXECUTE
          BEGIN
            DBMS_PIPE.UNPACK_MESSAGE(:return_name);
            DBMS_PIPE.UNPACK_MESSAGE(:value);
          END;
        END-EXEC;
        value.arr[value.len] = '\0';
        printf("Will execute system command '%s'\n", value.arr);

        status = system(value.arr);
        EXEC SQL EXECUTE
          BEGIN
            DBMS_PIPE.PACK_MESSAGE('done');
            DBMS_PIPE.PACK_MESSAGE(:status);
            :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
          END;
        END-EXEC;

        IF (status)
        {
          printf
           ("Daemon error while responding to system command.");
          printf("  status: %d\n", status);
        }
      }
      ELSE IF (!strcmp((char *) command.arr, "SQL")) {
        EXEC SQL EXECUTE
          BEGIN
            DBMS_PIPE.UNPACK_MESSAGE(:return_name);
            DBMS_PIPE.UNPACK_MESSAGE(:value);
          END;
        END-EXEC;
```

```
      value.arr[value.len] = '\0';
      printf("Will execute sql command '%s'\n", value.arr);

      EXEC SQL WHENEVER SQLERROR CONTINUE;
      EXEC SQL EXECUTE IMMEDIATE :value;
      status = sqlca.sqlcode;

      EXEC SQL WHENEVER SQLERROR DO sql_error();
      EXEC SQL EXECUTE
        BEGIN
          DBMS_PIPE.PACK_MESSAGE('done');
          DBMS_PIPE.PACK_MESSAGE(:status);
          :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
        END;
      END-EXEC;

      IF (status)
      {
        printf("Daemon error while responding to sql command.");
        printf("  status: %d\n", status);
      }
    }
    ELSE
    {
      printf
        ("Daemon error: invalid command '%s' received.\n",
          command.arr);
    }
  }
  ELSE
  {
    printf("Daemon error while waiting for signal.");
    printf("  status = %d\n", status);
  }
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);
```

Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

```
protocol_version      VARCHAR2        - '1', 10 bytes or less
returnpipe            VARCHAR2        - 30 bytes or less
service               VARCHAR2        - 30 bytes or less
arg1                  VARCHAR2/NUMBER/DATE
   ...
argn                  VARCHAR2/NUMBER/DATE
```

The recommended format for returning the result is:

```
success               VARCHAR2        - 'SUCCESS' if OK,
                                        otherwise error message
arg1                  VARCHAR2/NUMBER/DATE
   ...
```

```
  argn                  VARCHAR2/NUMBER/DATE
```

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

```
<loop forever>
  BEGIN dbms_stock_server.get_request(:stocksymbol); END;
  <figure out price based on stocksymbol (probably from some radio
        signal), set error if can't find such a stock>
  BEGIN dbms_stock_server.return_price(:error, :price); END;
```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```
CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe    VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS
    s INTEGER;
  BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        ' sending on pipe');
    END IF;
  END;

  PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                INTEGER;
    service          VARCHAR2(30);
  BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        'reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
      raise_application_error(-20000, 'Bad protocol: ' ||
        protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
      returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
  END;

  PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
```

```
  BEGIN
    IF errormsg is NULL THEN
      dbms_pipe.pack_message('SUCCESS');
      dbms_pipe.pack_message(price);
    ELSE
      dbms_pipe.pack_message(errormsg);
    END IF;
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:'||to_char(s)||
        ' sending on pipe');
    END IF;
  END;
END;
```

The procedure called by the client is:

```
CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
    RETURN VARCHAR2 IS
  s        INTEGER;
  price    VARCHAR2(20);
  errormsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1');  -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
      ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
      ' receiving on pipe');
  END IF;
  dbms_pipe.unpack_message(errormsg);
  IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
  END IF;
  dbms_pipe.unpack_message(price);
  RETURN price;
END;
```

You would typically only `GRANT EXECUTE` on `DBMS_STOCK_SERVICE` to the stock service application server, and would only `GRANT EXECUTE` on `stock_request` to those users allowed to use the service.

Summary of DBMS_PIPE Subprograms

Table 70–2 DBMS_PIPE Package Subprograms

Subprogram	Description
CREATE_PIPE Function on page 70-19	Creates a pipe (necessary for private pipes)
NEXT_ITEM_TYPE Function on page 70-21	Returns datatype of next item in buffer
PACK_MESSAGE Procedures on page 70-22	Builds message in local buffer
PURGE Procedure on page 70-24	Purges contents of named pipe
RECEIVE_MESSAGE Function on page 70-25	Copies message from named pipe into local buffer
REMOVE_PIPE Function on page 70-28	Removes the named pipe
RESET_BUFFER Procedure on page 70-27	Purges contents of local buffer
SEND_MESSAGE Function on page 70-29	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
UNIQUE_SESSION_NAME Function on page 70-31	Returns unique session name
UNPACK_MESSAGE Procedures on page 70-32	Accesses next item in buffer

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

Syntax

```
DBMS_PIPE.CREATE_PIPE (
   pipename     IN VARCHAR2,
   maxpipesize  IN INTEGER DEFAULT 8192,
   private      IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

Parameters

Table 70–3 CREATE_PIPE Function Parameters

Parameter	Description
`pipename`	Name of the pipe you are creating. You must use this name when you call `SEND_MESSAGE` and `RECEIVE_MESSAGE`. This name must be unique across the instance. Caution: Do not use pipe names beginning with `ORA$`. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.
`maxpipesize`	The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default `maxpipesize` is 8192 bytes. The `maxpipesize` for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of `SEND_MESSAGE` with larger values cause the `maxpipesize` to be increased. Callers with a smaller value use the existing, larger value.
`private`	Uses the default, `TRUE`, to create a private pipe. Public pipes can be implicitly created when you call `SEND_MESSAGE`.

Return Values

Table 70–4 CREATE_PIPE Function Return Values

Return	Description
0	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
ORA-23322	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 70–5 CREATE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call NEXT_ITEM_TYPE.

Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

Return Values

Table 70–6 NEXT_ITEM_TYPE Function Return Values

Return	Description
0	No more items
6	NUMBER
9	VARCHAR2
11	ROWID
12	DATE
23	RAW

PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer. To send a message, first make one or more calls to PACK_MESSAGE. Then, call SEND_MESSAGE to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type VARCHAR2, NCHAR, NUMBER, DATE., RAW and ROWID items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message.The overhead for all types other than VARCHAR is 4 bytes.

Syntax

```
DBMS_PIPE.PACK_MESSAGE (
   item  IN  VARCHAR2);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  NCHAR);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  NUMBER);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  DATE);

DBMS_PIPE.PACK_MESSAGE_RAW (
   item  IN  RAW);

DBMS_PIPE.PACK_MESSAGE_ROWID (
   item  IN  ROWID);
```

Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

Parameters

Table 70–7 PACK_MESSAGE Procedure Parameters

Parameter	Description
item	Item to pack into the local message buffer.

Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call SEND_MESSAGE to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling PURGE lets you free the memory associated with an implicitly-created pipe.

Syntax

```
DBMS_PIPE.PURGE (
   pipename  IN  VARCHAR2);
```

Pragmas

```
pragma restrict_references(purge,WNDS,RNDS);
```

Parameters

Table 70–8 PURGE Procedure Parameters

Parameter	Description
pipename	Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.

Usage Notes

Because PURGE calls RECEIVE_MESSAGE, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an ORA-23322 (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

Exceptions

Permission error if pipe belongs to another user.

RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
   pipename     IN VARCHAR2,
   timeout      IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(receive_message,WNDS,RNDS);
```

Parameters

Table 70–9 RECEIVE_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA$ are reserved for use by Oracle
timeout	Time to wait for a message, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.

Return Values

Table 70–10 RECEIVE_MESSAGE Function Return Values

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer. (This should not happen.)
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

Usage Notes

To receive a message from a pipe, first call RECEIVE_MESSAGE. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call RECEIVE_MESSAGE does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to UNPACK_MESSAGE to access the individual items in the message. The UNPACK_MESSAGE procedure is

overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT_ITEM_TYPE to determine the type of the next item in the buffer.

Exceptions

Table 70–11 RECEIVE_MESSAGE Function Exceptions

Exception	Description
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

RESET_BUFFER Procedure

This procedure resets the PACK_MESSAGE and UNPACK_MESSAGE positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

REMOVE_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by SEND_MESSAGE are automatically removed when empty. However, pipes created explicitly by CREATE_PIPE are removed only by calling REMOVE_PIPE, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling PURGE on an implicitly-created pipe.

Syntax

```
DBMS_PIPE.REMOVE_PIPE (
   pipename  IN  VARCHAR2)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

Parameters

Table 70–12 REMOVE_PIPE Function Parameters

Parameter	Description
pipename	Name of pipe that you want to remove.

Return Values

Table 70–13 REMOVE_PIPE Function Return Values

Return	Description
0	Success If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.
ORA-23322	Insufficient privileges. If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.

Exceptions

Table 70–14 REMOVE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.

SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to PACK_MESSAGE. You can create a pipe explicitly using CREATE_PIPE, otherwise, it is created implicitly.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename     IN VARCHAR2,
    timeout      IN INTEGER DEFAULT MAXWAIT,
    maxpipesize  IN INTEGER DEFAULT 8192)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(send_message,WNDS,RNDS);
```

Parameters

Table 70–15 SEND_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called CREATE_PIPE. Caution: Do not use pipe names beginning with 'ORA$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.
timeout	Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days).
maxpipesize	Maximum size allowed for the pipe, in bytes. The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value. Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications.

Return Values

Table 70–16 SEND_MESSAGE Function Return Values

Return	Description
0	Success. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
1	Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.
3	An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed.
ORA-23322	Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 70–17 SEND_MESSAGE Function Exception

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the `PIPENAME` parameter for your `SEND_MESSAGE` and `RECEIVE_MESSAGE` calls.

Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call UNPACK_MESSAGE.

> **Note:** The UNPACK_MESSAGE procedure is overloaded to return items of type VARCHAR2, NCHAR, NUMBER, or DATE. There are two additional procedures to unpack RAW and ROWID items.

Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT VARCHAR2);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT NCHAR);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT NUMBER);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT DATE);

DBMS_PIPE.UNPACK_MESSAGE_RAW (
   item  OUT RAW);

DBMS_PIPE.UNPACK_MESSAGE_ROWID (
   item  OUT ROWID);
```

Pragmas

```
pragma restrict_references(unpack_message,WNDS,RNDS);
pragma restrict_references(unpack_message_raw,WNDS,RNDS);
pragma restrict_references(unpack_message_rowid,WNDS,RNDS);
```

Parameters

Table 70–18 UNPACK_MESSAGE Procedure Parameters

Parameter	Description
item	Argument to receive the next unpacked item from the local message buffer.

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

71

DBMS_PREPROCESSOR

The DBMS_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics

Using DBMS_PREPROCESSOR

Overview

There are three styles of subprograms.

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a `VARCHAR2` string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a `VARCHAR2` index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is `VALID` and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single `VARCHAR2` string in the second style, or as a `VARCHAR2` index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the `VARCHAR2` length limit.

Operating Notes

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be VALID. Likewise, the source text passed in as a VARCHAR2 string or a VARCHAR2 index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.
- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as CREATE OR REPLACE. In general, the input source should be syntactically prepared in a way as if it were obtained from the ALL_SOURCE view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

  ```
  anonymous block   (BEGIN | DECLARE) ...
  package           PACKAGE <name> ...
  package body      PACKAGE BODY <name> ...
  procedure         PROCEDURE <name> ...
  function          FUNCTION <name> ...
  type              TYPE <name> ...
  type body         TYPE BODY <name> ...
  trigger           (BEGIN | DECLARE) ...
  ```

  If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.
- If the text of a wrapped PL/SQL unit is obtained from the ALL_SOURCE view, the keyword WRAPPED always immediately follows the name of the unit, as in this example:

  ```
  PROCEDURE "some proc" WRAPPED
  a000000
  b2
  ...
  ```

  If such source text is presented to one of the GET_POST_PROCESSED_SOURCE Functions or to one of the PRINT_POST_PROCESSED_SOURCE Procedures, the exception DBMS_PREPROCESSOR.WRAPPED_INPUT is raised.

Data Structures

The DBMS_PREPROCESSOR package defines a TABLE type.

Table Types

SOURCE_LINES_T Table Type

SOURCE_LINES_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

Syntax

```
TYPE source_lines_t IS
    TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_PREPROCESSOR Subprograms

Table 71–1 DBMS_PREPROCESSOR Package Subprograms

Subprogram	Description
GET_POST_PROCESSED_SOURCE Functions on page 71-8	Returns the post-processed source text
PRINT_POST_PROCESSED_SOURCE Procedures on page 71-10	Prints post-processed source text

GET_POST_PROCESSED_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   object_type    VARCHAR2,
   schema_name    VARCHAR2,
   object_name    VARCHAR2);
  RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   source        VARCHAR2);
  RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   source        source_lines_t);
  RETURN source_lines_t;
```

Parameters

Table 71–2 GET_POST_PROCESSED_SOURCE Function Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object.The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

Exceptions

Table 71–3 GET_POST_PROCESSED_SOURCE Function Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: ■ Character string buffer too small ■ A line is too long (> 32767 bytes)

PRINT_POST_PROCESSED_SOURCE Procedures

This overloaded procedure calls DBMS_OUTPUT.PUT_LINE to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   object_type    VARCHAR2,
   schema_name    VARCHAR2,
   object_name    VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   source        VARCHAR2);
```

Prints post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   source        source_lines_t);
```

Parameters

Table 71–4 PRINT_POST_PROCESSED_SOURCE Procedure Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object.The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Exceptions

Table 71–5 PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.

Table 71–5 (Cont.) PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-06502	Numeric or value error: ■ Character string buffer too small ■ A line is too long (> 32767 bytes)

Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

72

DBMS_PREDICTIVE_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining (ODM).

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

Data used by ODM consists of tables or views stored in an Oracle database. Each column in a record (row) holds an item of information. Data mining models are often used to identify important columns or to predict column values.

The `DBMS_PREDICTIVE_ANALYTICS` package supports the following functionality:

- `EXPLAIN` - Ranks attributes in order of influence in explaining a target column.
- `PREDICT` - Predict the value of a column.

This chapter contains the following topics:

Using DBMS_PREDICTIVE_ANALYTICS

This section contains topics which relate to using the `DBMS_PREDICTIVE_ANALYTICS` package.

Overview

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

`DBMS_PREDICTIVE_ANALYTICS` automates parts of step 3 and steps 4 and 5 of this process.

The user provides input data in a single table or view. For `EXPLAIN`, the user identifies a column to explain; for `PREDICT`, the user identifies a column to predict and also identifies a case id column. The procedure accepts the input, analyzes the data, performs suitable preprocessing, builds and tests models, selects the best model, and applies the model to data.

Input for `DBMS_PREDICTIVE_ANALYTICS` is the name of a single table or view in an Oracle database. Each column in the table must have one of the following data types:

- `NUMBER`
- `FLOAT`
- `CHAR`
- `VARCHAR2`
- `DATE`
- `TIMESTAMP`

Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

Table 72–1 DBMS_PREDICTIVE_ANALYTICS Package Subprograms

Subprogram	Purpose
EXPLAIN Procedure on page 72-5	Ranks attributes in order of influence in explaining a target column
PREDICT Procedure on page 72-7	Predicts the value of a column based on values in the input data

EXPLAIN Procedure

The procedure ranks attributes in order of influence in explaining a target column.

The procedure analyzes the input table, performs data preprocessing, builds a model, analyzes the model to identify key columns, and creates a result table listing the important columns and quantifying the explanatory power of each important column.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
     data_table_name     IN VARCHAR2,
     explain_column_name IN VARCHAR2,
     result_table_name   IN VARCHAR2,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72–2 EXPLAIN Procedure Parameters

Parameter	Description
`data_table_name`	Name of input table or view
`explain_column_name`	Name of column to be explained
`result_table_name`	Name of table where results are saved
`data_schema_name`	Name of schema where the input table or view resides. Default: the current schema.

Usage Notes

The result table has the following definition:

```
column_name              VARCHAR2(30)
explanatory_value        NUMBER
rank                     NUMBER
```

Table 72–3 describes the columns in the result table.

Table 72–3 EXPLAIN Procedure Result Table

Column Name	Meaning
`column_name`	Name of a column in the input data; all columns except the explained column are listed in the result table.
`explanatory_value`	Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1. An individual column's explanatory value is independent of other columns in the input table. Instead, the values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column. An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for `PREDICT`. In practice, an explanatory power equal to 1 is rarely returned.

Table 72–3 (Cont.) EXPLAIN Procedure Result Table

Column Name	Meaning
rank	Ranking of explanatory power. Rows with equal values for explanatory_power have the same rank. Rank values are not skipped in the event of ties.

Example

The following example performs an EXPLAIN operation and views the results:

```
--Perform EXPLAIN operation
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
        data_table_name      => 'census_dataset',
        explain_column_name  => 'class',
        result_table_name    => 'census_explain_result');
END;
/
--View results
SELECT * FROM census_explain_result;

COLUMN_NAME     EXPLANATORY_VALUE  RANK
-----------     -----------------  ----
RELATIONSHIP    .21234788             1
MARITAL_STATUS  .195201808            2
CAPITAL_GAIN    .102951498            3
OCCUPATION      .06883765             4
EDUCATION       .067517394            5
EDUCATION_NUM   .067517394            5
SEX             .055541542            6
HOURS_PER_WEEK  .032476973            7
AGE             .021933245            8
CAPITAL_LOSS    .013083265            9
RACE            .009670242           10
WORKCLASS       0                    11
NATIVE_COUNTRY  0                    11
WEIGHT          0                    11
PERSON_ID       0                    11

15 rows selected.
```

PREDICT Procedure

This procedure is used to predict values of a specific column. The input consists of a table and a target column, the target column containing the values to predict. The input data must contain some cases in which the target value is known (that is, is not NULL). Cases where the target values are known are used to train models.

PREDICT returns a predicted value for every case, including those where the value is known.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy                OUT NUMBER,
    data_table_name         IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72–4 PREDICT Procedure Parameters

Parameter	Description
data_table_name	Name of input table or view
case_id_column_name	Name of column that uniquely identifies each case in the input data (for example, the column containing the customer id or case id)
target_column_name	Name of the column containing the value to predict (the target)
result_table_name	Name of table where results will be saved
data_schema_name	Name of schema where the input table or view resides and where the result table is written. Default: the current schema.

Usage Notes

The result table has the following definition:

```
case_id_column_name      VARCHAR2 or NUMBER
prediction               VARCHAR2 or NUMBER
probability_number       NUMBER
```

Table 72–5 describes the result table of the PREDICT procedure.

Table 72–5 PREDICT Procedure Result Table

Column Name	Meaning
case_id_column_name	Each of the cases identified in the case_id column. This is the same as the name that was passed in. The data type is the same as input case_id type.
prediction	The predicted value of the target column for the given case. The data type is the same as the input target_column_name type.
probability	For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.

Predictions are returned for all cases in the input data.

Predicted values for known cases may be interesting in some situations, for example, to perform deviation analysis, that is, to compare predicted values and actual values.

Example

The following example performs a `PREDICT` operation and display the first 10 predictions. In this example, since the target column `class` is categorical, a probability is returned for each prediction:

```
--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy             => v_accuracy,
        data_table_name      => 'census_dataset',
        case_id_column_name  => 'person_id',
        target_column_name   => 'class',
        result_table_name    => 'census_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/
--View first 10 predictions
SELECT * FROM census_predict_result where rownum < 10;

PERSON_ID    PREDICTION      PROBABILITY
----------   ----------      -----------
  2                   1      .418787003
  7                   0      .922977991
  8                   0      .99869723
  9                   0      .999999605
 10                   0      .9999009
 11                   0      .999999996
 12                   1      .953949094
 15                   0      .99999997
 16                   0      .999968961

9 rows selected.
```

73

DBMS_PROFILER

The DBMS_PROFILER package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

Using DBMS_PROFILER

Overview

This package enables the collection of profiler (perfoprmance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

> **Note:** It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in Table 73–1, Table 73–2, and Table 73–3.

Table 73–1 Columns in Table PLSQL_PROFILER_RUNS

Column	Datatype	Definition
runid	NUMBER PRIMARY KEY	Unique run identifier from plsql_profiler_ runnumber
related_run	NUMBER	Runid of related run (for client/server correlation)
run_owner	VARCHAR2(32),	User who started run
run_date	DATE	Start time of run
run_comment	VARCHAR2(2047)	User provided comment for this run
run_total_ time	NUMBER	Elapsed time for this run in nanoseconds
run_system_ info	VARCHAR2(2047)	Currently unused
run_comment1	VARCHAR2(2047)	Additional comment
spare1	VARCHAR2(256)	Unused

Table 73–2 Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
runid	NUMBER	Primary key, references plsql_profiler_runs,
unit_number	NUMBER	Primary key, internally generated library unit #
unit_type	VARCHAR2(32)	Library unit type
unit_owner	VARCHAR2(32)	Library unit owner name
unit_name	VARCHAR2(32)	Library unit name timestamp on library unit
unit_ timestamp	DATE	In the future will be used to detect changes to unit between runs

Table 73–2 (Cont.) Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

Table 73–3 Columns in Table PLSQL_PROFILER_DATA

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer(profrep.sql) is provided with the PL/SQL demo scripts.

Security Model

The profiler only gathers data for units for which a user has CREATE privilege; you cannot use the package to profile units for which EXECUTE ONLY access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled DEBUG. Oracle advises that modules that are being profiled should be compiled DEBUG, since this provides additional information about the unit in the database.

Note: DBMS_PROFILER treats any program unit that is compiled in NATIVE mode as if you do not have CREATE privilege, that is, you will not get any output.

Operational Notes

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a *"run"*. A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

A typical run involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

> **Note:** The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures.

Flushing the collected data involves storing collected data in database tables. The tables should already exist in the profiler user's schema. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, *"warm up"* the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the SYSADMIN should use a modified `PROFLOAD.SQL` script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

Note: Do not alter the actual fields of the tables.

See Also: "FLUSH_DATA Function and Procedure" on page 73-10.

Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

Exceptions

Table 73–4 DBMS_PROFILER Exceptions

Exception	Description
version_mismatch	Corresponds to error_version.
profiler_error	Corresponds to either "error_param" or "error_io".

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'

  ```
  error_param constant binary_integer := 1;
  ```

- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'

  ```
  error_io    constant binary_integer := 2;
  ```

- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the DBMS_PROFILER package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.

  ```
  error_version constant binary_integer := -1;
  ```

Summary of DBMS_PROFILER Subprograms

Table 73–5 DBMS_PROFILER Package Subprograms

Subprogram	Description
FLUSH_DATA Function and Procedure on page 73-10	Flushes profiler data collected in the user's session
GET_VERSION Procedure on page 73-11	Gets the version of this API
INTERNAL_VERSION_CHECK Function on page 73-12	Verifies that this version of the `DBMS_PROFILER` package can work with the implementation in the database
PAUSE_PROFILER Function and Procedure on page 73-13	Pauses profiler data collection
RESUME_PROFILER Function and Procedure on page 73-14	Resumes profiler data collection
START_PROFILER Functions and Procedures on page 73-15	Starts profiler data collection in the user's session
STOP_PROFILER Function and Procedure on page 73-16	Stops profiler data collection in the user's session

FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

> **Note:** Use the PROFTAB.SQL script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```
DBMS_PROFILER.FLUSH_DATA
  RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```

GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (
   major  OUT BINARY_INTEGER,
   minor  OUT BINARY_INTEGER);
```

Parameters

Table 73–6 GET_VERSION Procedure Parameters

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

INTERNAL_VERSION_CHECK Function

This function verifies that this version of the DBMS_PROFILER package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK
  RETURN BINARY_INTEGER;
```

PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.PAUSE_PROFILER;
```

RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.RESUME_PROFILER;
```

START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the START_PROFILER function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```
DBMS_PROFILER.START_PROFILER(
   run_comment   IN VARCHAR2 := sysdate,
   run_comment1  IN VARCHAR2 :='',
   run_number    OUT BINARY_INTEGER)
 RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
   run_comment IN VARCHAR2 := sysdate,
   run_comment1 IN VARCHAR2 :='')
RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
   run_comment   IN VARCHAR2 := sysdate,
   run_comment1  IN VARCHAR2 :='',
   run_number    OUT BINARY_INTEGER);

DBMS_PROFILER.START_PROFILER(
   run_comment IN VARCHAR2 := sysdate,
   run_comment1 IN VARCHAR2 :='');
```

Parameters

Table 73–7 START_PROFILER Function Parameters

Parameter	Description
run_comment	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
run_number	Stores the number of the run so you can store and later recall the run's data.
run_comment1	Allows you to make interesting comments about the run.

STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.STOP_PROFILER;
```

74

DBMS_PROPAGATION_ADM

The DBMS_PROPAGATION_ADM package, one of a set of Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

This chapter contains the following topic:

Summary of DBMS_PROPAGATION_ADM Subprograms

Table 74–1 DBMS_PROPAGATION_ADM Package Subprograms

Subprogram	Description
ALTER_PROPAGATION Procedure on page 74-3	Adds, alters, or removes a rule set for a propagation
CREATE_PROPAGATION Procedure on page 74-5	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
DROP_PROPAGATION Procedure on page 74-8	Drops a propagation
START_PROPAGATION Procedure on page 74-10	Starts a propagation
STOP_PROPAGATION Procedure on page 74-11	Stops a propagation

Note: All subprograms commit unless specified otherwise.

ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

> **See Also:** *Oracle Streams Concepts and Administration* and Chapter 92, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
   propagation_name          IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 74–2 ALTER_PROPAGATION Procedure Parameters

Parameter	Description
`propagation_name`	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `hr` schema named `prop_rules`, enter `hr.prop_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_rule_set` parameter is set to `FALSE`, then the procedure retains any existing positive rule set. If you specify `NULL` and the `remove_rule_set` parameter is set to `TRUE`, then the procedure removes any existing positive rule set.
`remove_rule_set`	If `TRUE`, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages. If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set. If `FALSE`, then the procedure retains the positive rule set for the specified propagation. If the `rule_set_name` parameter is non-`NULL`, then this parameter should be set to `FALSE`.

Table 74–2 (Cont.) ALTER_PROPAGATION Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages. If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages. If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified propagation. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
   propagation_name        IN  VARCHAR2,
   source_queue            IN  VARCHAR2,
   destination_queue       IN  VARCHAR2,
   destination_dblink      IN  VARCHAR2  DEFAULT NULL,
   rule_set_name           IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN  BOOLEAN   DEFAULT NULL);
```

Parameters

Table 74–3 CREATE_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner. **Note:** The propagation_name setting cannot be altered after the propagation is created.
source_queue	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue	The name of the destination queue, specified as [*schema_name.*]*queue_name*. For example, to specify a destination queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_dblink	The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue. If NULL, then the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.

Table 74–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue. If you specify NULL, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.
negative_rule_set_name	The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages. If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue. If you specify NULL, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.
queue_to_queue	If TRUE, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in a Real Application Clusters (RAC) database. If FALSE or NULL, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in a RAC environment. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:

- Chapter 92, "DBMS_RULE_ADM"
- *Oracle Streams Concepts and Administration* for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all captured and user-enqueued messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
   propagation_name       IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 74–4 DROP_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about Streams data dictionary views

The following are the data dictionary views for Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note: When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(
   propagation_name  IN  VARCHAR2);
```

Parameter

Table 74–5 START_PROPAGATION Procedure Parameter

Parameter	Description
`propagation_name`	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
   propagation_name  IN  VARCHAR2,
   force             IN  BOOLEAN  DEFAULT FALSE);
```

Parameter

Table 74–6 STOP_PROPAGATION Procedure Parameter

Parameter	Description
propagation_name	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
force	If TRUE, then the procedure stops the propagation and clears the statistics for the propagation. If FALSE, then the procedure stops the propagation without clearing the statistics for the propagation.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the propagation is not started upon database instance startup.

75

DBMS_RANDOM

The DBMS_RANDOM package provides a built-in random number generator. DBMS_RANDOM is not intended for cryptography.

This chapter contains the following topics:

Using DBMS_RANDOM

Security Model

This package should be installed as `SYS`. By default, the package is initialized with the current user name, current time down to the second, and the current session.

Operational Notes

- `DBMS_RANDOM.RANDOM` produces integers in [-2^^31, 2^^31).
- `DBMS_RANDOM.VALUE` produces numbers in [0,1) with 38 digits of precision.

DBMS_RANDOM can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, userid, and process id if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

Summary of DBMS_RANDOM Subprograms

Table 75–1 DBMS_RANDOM Package Subprograms

Subprogram	Description
INITIALIZE Procedure on page 75-6	Initializes the package with a seed value
NORMAL Function on page 75-7	Returns random numbers in a normal distribution
RANDOM Procedure on page 75-8	Generates a random number
SEED Procedures on page 75-9	Resets the seed
STRING Function on page 75-10	Gets a random string
TERMINATE Procedure on page 75-11	Terminates package
VALUE Functions on page 75-12	This function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to `low` and less than `high`

Note: The INITIALIZE Procedure, RANDOM Procedure and the TERMINATE Procedure are all obsolete and, while currently supported, are included in this release for legacy reasons only.

INITIALIZE Procedure

This procedure initializes the generator (but see Usage Notes).

Syntax

```
DBMS_RANDOM.INITIALIZE (
   val  IN  BINARY_INTEGER);
```

Pragmas

```
PRAGMA restrict_references (initialize, WNDS)
```

Parameters

Table 75–2 INITIALIZE Procedure Parameters

Parameter	Description
val	The seed number used to generate a random number.

Usage Notes

This procedure is obsolete as it simply calls the SEED Procedures on page 75-9.

NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL
  RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS)
```

Return Values

Table 75–3 NORMAL Procedure Parameters

Parameter	Description
number	Returns a random number.

RANDOM Procedure

This procedure generates a random number (but see Usage Notes).

Syntax

```
DBMS_RANDOM.RANDOM
   RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDS)
```

Return Values

Table 75–4 RANDOM Procedure Parameters

Parameter	Description
`binary_integer`	Returns a random integer greater or equal to -power(2,31) and less than power(2,31).

Usage Notes

This procedure is obsolete and, although it is currently supported, it should not be used.

SEED Procedures

This procedure resets the seed.

Syntax

```
DBMS_RANDOM.SEED (
   seed  IN  BINARY_INTEGER);

DBMS_RANDOM.SEED (
   seed  IN  VARCHAR2);
```

Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

Parameters

Table 75–5 SEED Procedure Parameters

Parameter	Description
seed	Seed number or string used to generate a random number.

Usage Notes

The seed can be a string up to length 2000.

STRING Function

This function gets a random string.

Syntax

```
DBMS_RANDOM.STRING
   opt  IN  CHAR,
   len  IN  NUMBER)
  RETURN VARCHAR2;
```

Pragmas

```
PRAGMA restrict_references (string, WNDS)
```

Parameters

Table 75–6 STRING Function Parameters

Parameter	Description
opt	Specifies what the returning string looks like: ■ 'u', 'U' - returning string in uppercase alpha characters ■ 'l', 'L' - returning string in lowercase alpha characters ■ 'a', 'A' - returning string in mixed case alpha characters ■ 'x', 'X' - returning string in uppercase alpha-numeric characters ■ 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters.
len	The length of the returning string.

Return Values

Table 75–7 STRING Function Return Values

Parameter	Description
VARCHAR2	Returns a VARCHAR2.

TERMINATE Procedure

When you are finished with the package, call the TERMINATE procedure (but see Usage Notes)

Syntax

```
DBMS_RANDOM.TERMINATE
```

Usage Notes

This procedure performs no function and, although it is currently supported, it is obsolete and should not be used.

VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number x, where x is greater than or equal to `low` and less than `high`.

Syntax

```
DBMS_RANDOM.VALUE
  RETURN NUMBER;

DBMS_RANDOM.VALUE(
  low  IN  NUMBER,
  high IN  NUMBER)
RETURN NUMBER;
```

Parameters

Table 75–8 VALUE Function Parameters

Parameter	Description
`low`	The lowest number in a range from which to generate a random number. The number generated may be equal to `low`.
`high`	The highest number below which to generate a random number. The number generated will be less than `high`.

Return Values

Table 75–9 VALUE Function Return Values

Parameter	Description
`NUMBER`	Returns an Oracle Number.

76

DBMS_RECTIFIER_DIFF

The `DBMS_RECTIFIER_DIFF` package provides an interface used to detect and resolve data inconsistencies between two replicated sites.

Documentation of DBMS_RECTIFIER_DIFF

For a complete description of this package within the context of Replication, see DBMS_RECTIFIER_DIFF in the *Oracle Database Advanced Replication Management API Reference*.

77

DBMS_REDEFINITION

The DBMS_REDEFINITION package provides an interface to perform an online redefinition of tables.

> **See Also:** *Oracle Database Administrator's Guide* for more information about online redefinition of tables

This chapter contains the following topics:

Using DBMS_REDEFINITION

Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

Constants

The DBMS_REDEFINITION package uses the constants shown in Table 77–1, " DBMS_REDEFINITION Constants":

Table 77–1 DBMS_REDEFINITION Constants

Constant	Type	Value	Description
CONS_CONSTRAINT	PLS_INTEGER	3	Used to specify that dependent object type is a constraint
CONS_INDEX	PLS_INTEGER	2	Used to specify that dependent object type is a index
CONS_ORIG_PARAMS	PLS_INTEGER	1	Used to specify that indexes should be cloned with their original storage parameters
CONS_TRIGGER	PLS_INTEGER	4	Used to specify that dependent object type is a trigger
CONS_USE_PK	BINARY_INTEGER	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
CONS_USE_ROWID	BINARY_INTEGER	2	Used to indicate that the redefinition should be done using rowids

Operational Notes

- CONS_USE_PK and CONS_USE_ROWID are constants used as input to the "options_flag" parameter in both the START_REDEF_TABLE Procedure and CAN_REDEF_TABLE Procedure. CONS_USE_ROWID is used to indicate that the redefinition should be done using rowids while CONS_USE_PK implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- CONS_INDEX, CONS_TRIGGER and CONS_CONSTRAINT are used to specify the type of the dependent object being (un)registered in REGISTER_DEPENDENT_OBJECT Procedure and UNREGISTER_DEPENDENT_OBJECT Procedure (parameter "dep_type").

  CONS_INDEX ==> dependent object is of type INDEX

  CONS_TRIGGER ==> dependent object is of type TRIGGER

  CONS_CONSTRAINT==> dependent object type is of type CONSTRAINT
- CONS_ORIG_PARAMS as used as input to the "copy_indexes" parameter in COPY_TABLE_DEPENDENTS Procedure. Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

Rules and Limits

For information about various rules and limits that apply to implementation of this package, see the *Oracle Database Administrator's Guide*.

Summary of DBMS_REDEFINITION Subprograms

Table 77–2 DBMS_REDEFINITION Package Subprograms

Subprogram	Description
ABORT_REDEF_TABLE Procedure on page 77-8	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
CAN_REDEF_TABLE Procedure on page 77-9	Determines if a given table can be redefined online
COPY_TABLE_DEPENDENTS Procedure on page 77-10	Copies the dependent objects of the original table onto the interim table
FINISH_REDEF_TABLE Procedure on page 77-12	Completes the redefinition process.
REGISTER_DEPENDENT_OBJECT Procedure on page 77-13	Registers a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table
START_REDEF_TABLE Procedure on page 77-14	Initiates the redefinition process
SYNC_INTERIM_TABLE Procedure on page 77-15	Keeps the interim table synchronized with the original table
UNREGISTER_DEPENDENT_OBJECT Procedure on page 77-16	Unregisters a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table

ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process. This procedure can also be used to terminate the redefinition process any time after the START_REDEF_TABLE Procedure has been called and before the FINISH_REDEF_TABLE Procedure is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (
   uname       IN VARCHAR2,
   orig_table  IN VARCHAR2,
   int_table   IN VARCHAR2,
  part_name    IN  VARCHAR2 := NULL);
```

Parameters

Table 77–3 ABORT_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
   uname         IN  VARCHAR2,
   tname        IN  VARCHAR2,
   options_flag  IN  PLS_INTEGER := 1,
   part_name     IN  VARCHAR2 := NULL);
```

Parameters

Table 77–4 CAN_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the table
tname	The name of the table to be re-organized
options_flag	Indicates the type of redefinition method to use. ■ If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. ■ If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS(
   uname                   IN  VARCHAR2,
   orig_table              IN  VARCHAR2,
   int_table               IN  VARCHAR2,
   copy_indexes            IN  PLS_INTEGER := 1,
   copy_triggers           IN  BOOLEAN     := TRUE,
   copy_constraints        IN  BOOLEAN     := TRUE,
   copy_privileges         IN  BOOLEAN     := TRUE,
   ignore_errors           IN  BOOLEAN     := FALSE,
   num_errors              OUT PLS_INTEGER,
   copy_statistics         IN  BOOLEAN     := FALSE);
```

Parameters

Table 77–5 COPY_TABLE_DEPENDENTS Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table being redefined.
int_table	The name of the interim table.
copy_indexes	A flag indicating whether to copy the indexes ■ 0 - do not copy any index ■ dbms_redefinition.cons_orig_params – copy the indexes using the physical parameters of the source indexes
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	The number of errors that occurred while cloning dependent objects
copy_statistics	TRUE = copy statistics, FALSE = do nothing

Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the COPY_TABLE_DEPENDENTS Procedure again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the REGISTER_DEPENDENT_OBJECT Procedure.
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process. Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (
   uname       IN VARCHAR2,
   orig_table  IN VARCHAR2,
   int_table   IN VARCHAR2,
   part_name   IN  VARCHAR2 := NULL);
```

Parameters

Table 77–6 FINISH_REDEF_TABLE Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

Syntax

```
DBMS_REDEFINITION.REGISTER_DEPEPENDENT_OBJECT(
   uname             IN VARCHAR2,
   orig_table        IN VARCHAR2,
   int_table         IN VARCHAR2,
   dep_type          IN  PLS_INTEGER,
   dep_owner         IN VARCHAR2,
   dep_orig_name     IN VARCHAR2,
   dep_int_name      IN  VARCHAR2);
```

Parameters

Table 77–7 REGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA_REDEFINITION_ERRORS if an entry exists for that object.

START_REDEF_TABLE Procedure

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
   uname          IN VARCHAR2,
   orig_table     IN VARCHAR2,
   int_table      IN VARCHAR2,
   col_mapping    IN VARCHAR2 := NULL,
   options_flag   IN BINARY_INTEGER := 1,
   orderby_cols   IN VARCHAR2 := NULL,
   part_name     IN  VARCHAR2 := NULL);
```

Parameters

Table 77–8 START_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
col_mapping	The mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition.
options_flag	Indicates the type of redefinition method to use. ■ If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. ■ If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
   uname          IN  VARCHAR2,
   orig_table     IN  VARCHAR2,
   int_table      IN  VARCHAR2,
   part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 77–9 SYNC_INTERIM_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the table.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the FINISH_REDEF_TABLE Procedure before completing the online redefinition.
- This procedure can be called between long running operations (such as CREATE INDEX) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger or constraint) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPEPENDENT_OBJECT(
   uname              IN VARCHAR2,
   orig_table        IN VARCHAR2,
   int_table         IN VARCHAR2,
   dep_type          IN PLS_INTEGER,
   dep_owner         IN VARCHAR2,
   dep_orig_name     IN VARCHAR2,
   dep_int_name      IN  VARCHAR2);
```

Parameters

Table 77–10 UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

78

DBMS_REFRESH

The DBMS_REFRESH package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time.

- Documentation of DBMS_REFRESH

Documentation of DBMS_REFRESH

For a complete description of this package within the context of Replication, see `DBMS_REFRESH` in the *Oracle Database Advanced Replication Management API Reference*.

79

DBMS_REPAIR

The DBMS_REPAIR package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

> **See Also:** For detailed information about using the DBMS_REPAIR package, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

Using DBMS_REPAIR

Overview

Note: The DBMS_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

Security Model

The package is owned by `SYS`. Execution privilege is not granted to other users.

Constants

The DBMS_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_REPAIR.TABLE_OBJECT.

Table 79–1 lists the parameters and the enumerated constants.

Table 79–1 DBMS_REPAIR Parameters with Enumerated Constants

Parameter	Option	Type	Description
object_type	■ TABLE_OBJECT ■ INDEX_OBJECT ■ CLUSTER_OBJECT	BINARY_ INTEGER	
action	■ CREATE_ACTION ■ DROP_ACTION ■ PURGE_ACTION	BINARY_ INTEGER	
table_type	■ REPAIR_TABLE ■ ORPHAN_TABLE	BINARY_ INTEGER	
flags	■ SKIP_FLAG ■ NOSKIP_FLAG	BINARY_ INTEGER	
object_id	■ ALL_INDEX_ID := 0	BINARY_ INTEGER	Clean up all objects that qualify
wait_for_lock	■ LOCK_WAIT := 1 ■ LOCK_NOWAIT := 0	BINARY_ INTEGER	Specifies whether to try getting DML locks on underlying table [[sub]partition] object

Note: The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

Operating Notes

The procedure to create the ORPHAN_KEYS_TABLE is similar to the one used to create the REPAIR_TABLE.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the CHECK_OBJECT Procedure would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN_' prefix. The following code is also legal:

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;
```

When invoking the CHECK_OBJECT Procedure the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the ADMIN_TABLES Procedure or CREATE_ACTION.

Other actions in the ADMIN_TABLES Procedure can be used to purge/delete the REPAIR_TABLE and the ORPHAN_KEYS_TABLE.

Exceptions

Table 79–2 DBMS_REPAIR Exceptions

Exception	Description	Action
942	Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn't exist.	
955	Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.	
24120	An invalid parameter was passed to the specified DBMS_REPAIR procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the BLOCK_START and BLOCK_END parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid ACTION parameter was specified.	Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run.	Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed.
24127	TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.	Do not specify TABLESPACE when performing actions other than CREATE_ACTION.
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

Examples

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */

EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/

EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

Summary of DBMS_REPAIR Subprograms

Table 79–3 DBMS_REPAIR Package Subprograms

Subprogram	Description
ADMIN_TABLES Procedure on page 79-10	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
CHECK_OBJECT Procedure on page 79-11	Detects and reports corruptions in a table or index
DUMP_ORPHAN_KEYS Procedure on page 79-13	Reports on index entries that point to rows in corrupt data blocks
FIX_CORRUPT_BLOCKS Procedure on page 79-14	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
ONLINE_INDEX_CLEAN Function on page 79-15	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
REBUILD_FREELISTS Procedure on page 79-16	Rebuilds an object's freelists
SEGMENT_FIX_STATUS Procedure on page 79-17	Fixes the corrupted state of a bitmap entry
SKIP_CORRUPT_BLOCKS Procedure on page 79-18	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
   table_name  IN   VARCHAR2,
   table_type  IN   BINARY_INTEGER,
   action      IN   BINARY_INTEGER,
   tablespace  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 79–4 ADMIN_TABLES Procedure Parameters

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See "Constants" on page 79-5.
action	Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See "Constants" on page 79-5.
tablespace	Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   relative_fno      IN  BINARY_INTEGER DEFAULT NULL,
   block_start       IN  BINARY_INTEGER DEFAULT NULL,
   block_end         IN  BINARY_INTEGER DEFAULT NULL,
   corrupt_count     OUT BINARY_INTEGER);
```

Parameters

Table 79–5 CHECK_OBJECT Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See "Constants" on page 79-5.
repair_table_name	Name of the repair table to be populated. The table must exist in the SYS schema. Use the ADMIN_TABLES Procedure to create a repair table. The default name is REPAIR_TABLE.
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of block_start or block_end is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   orphan_table_name IN  VARCHAR2       DEFAULT 'ORPHAN_KEYS_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   key_count         OUT BINARY_INTEGER);
```

Parameters

Table 79–6 DUMP_ORPHAN_KEYS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is INDEX_OBJECT See "Constants" on page 79-5.
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.
flags	Reserved for future use.
key_count	Number of index entries processed.

FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the CHECK_OBJECT Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   fix_count         OUT BINARY_INTEGER);
```

Parameters

Table 79–7 FIX_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See "Constants" on page 79-5.
repair_table_name	Name of the repair table with the repair directives. Must exist in the SYS schema.
flags	Reserved for future use.
fix_count	Number of blocks fixed.

ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds. This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns `TRUE` if all indexes specified were cleaned up and `FALSE` if one or more indexes could not be cleaned up.

Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
   object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
   wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
 RETURN BOOLEAN;
```

Parameters

Table 79–8 ONLINE_INDEX_CLEAN Function Parameters

Parameter	Description
`object_id`	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
`wait_for_lock`	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If `LOCK_NOWAIT` is specified, then the lock get does not retry.

REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object. All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
   schema_name    IN VARCHAR2,
   object_name    IN  VARCHAR2,
   partition_name IN VARCHAR2 DEFAULT NULL,
   object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 79–9 REBUILD_FREELISTS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object whose freelists are to be rebuilt.
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See"Constants" on page 79-5.

SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
   segment_owner   IN VARCHAR2,
   segment_name    IN VARCHAR2,
   segment_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
   file_number     IN BINARY_INTEGER DEFAULT NULL,
   block_number    IN BINARY_INTEGER DEFAULT NULL,
   status_value    IN BINARY_INTEGER DEFAULT NULL,
   partition_name  IN VARCHAR2 DEFAULT NULL,);
```

Parameters

Table 79–10 SEGMENT_FIX_STATUS Procedure Parameters

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
status_value	(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: ■ 1 = block is full ■ 2 = block is 0-25% free ■ 3 = block is 25-50% free ■ 4 = block is 50-75% free ■ 5 = block is 75-100% free The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.

SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

> **Note:** When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
   schema_name  IN VARCHAR2,
   object_name  IN VARCHAR2,
   object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
   flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 79–11 SKIP_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
`schema_name`	Schema name of the object to be processed.
`object_name`	Name of the object.
`object_type`	Type of the object to be processed. This must be either `TABLE_OBJECT` (default) or `CLUSTER_OBJECT`. See "Constants" on page 79-5.
`flags`	If `SKIP_FLAG` is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If `NOSKIP_FLAG` is specified, then scans that encounter software corrupt blocks return an `ORA-1578`. See"Constants" on page 79-5.

80

DBMS_REPCAT

The DBMS_REPCAT package provides routines to administer and update the replication catalog and environment.

- Documentation of DBMS_REPCAT

Documentation of DBMS_REPCAT

For a complete description of this package within the context of Replication, see `DBMS_REPCAT` in the *Oracle Database Advanced Replication Management API Reference.*

81

DBMS_REPCAT_ADMIN

The DBMS_REPCAT_ADMIN package enables you to create users with the privileges needed by the symmetric replication facility.

Documentation of DBMS_REPCAT_ADMIN

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_ADMIN` in the *Oracle Database Advanced Replication Management API Reference*.

82

DBMS_REPCAT_INSTANTIATE

The `DBMS_REPCAT_INSTANTIATE` package instantiates deployment templates.

- Documentation of DBMS_REPCAT_INSTANTIATE

Documentation of DBMS_REPCAT_INSTANTIATE

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_INSTANTIATE` in the *Oracle Database Advanced Replication Management API Reference*.

83

DBMS_REPCAT_RGT

The DBMS_REPCAT_RGT package controls the maintenance and definition of refresh group templates.

- Documentation of DBMS_REPCAT_RGT

Documentation of DBMS_REPCAT_RGT

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_RGT` in the *Oracle Database Advanced Replication Management API Reference*.

84

DBMS_REPUTIL

The `DBMS_REPUTIL` package contains subprograms to generate shadow tables, triggers, and packages for table replication, as well as subprograms to generate wrappers for replication of standalone procedure invocations and packaged procedure invocations. This package is referenced only by the generated code.

Documentation of DBMS_REPUTIL

For a complete description of this package within the context of Replication, see `DBMS_REPUTIL` in the *Oracle Database Advanced Replication Management API Reference*.

85

DBMS_RESOURCE_MANAGER

The DBMS_RESOURCE_MANAGER package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

> **See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

Using DBMS_RESOURCE_MANAGER

Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures. The procedures to grant and revoke this privilege are in the package Chapter 86, "DBMS_RESOURCE_MANAGER_PRIVS".

Constants

Table 85–1 Constants - Names and Oracle Enterprise Manager Abbreviations

Constant	Definition
CLIENT_MACHINE	CONSTANT VARCHAR2(30) := 'CLIENT_MACHINE';
CLIENT_OS_USER	CONSTANT VARCHAR2(30) := 'CLIENT_OS_USER';
CLIENT_PROGRAM	CONSTANT VARCHAR2(30) := 'CLIENT_PROGRAM';
MODULE_NAME	CONSTANT VARCHAR2(30) := 'MODULE_NAME';
MODULE_NAME_ACTION	CONSTANT VARCHAR2(30) := 'MODULE_NAME_ACTION';
ORACLE_USER	CONSTANT VARCHAR2(30) := 'ORACLE_USER'
SERVICE_MODULE	CONSTANT VARCHAR2(30) := 'SERVICE_MODULE';
SERVICE_MODULE_ ACTION	CONSTANT VARCHAR2(30) := 'SERVICE_MODULE_ ACTION';
SERVICE_NAME	CONSTANT VARCHAR2(30) := 'SERVICE_NAME';

Examples

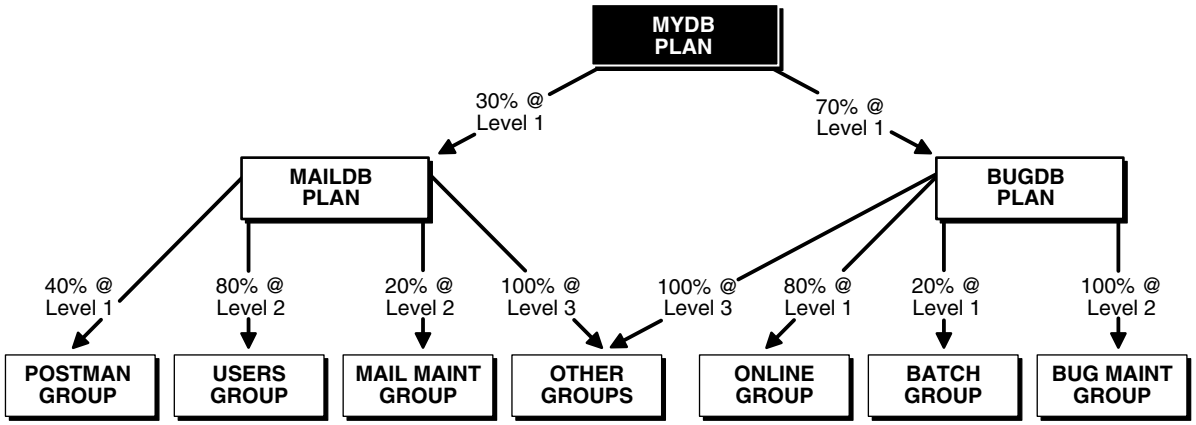
One of the advantages of plans is that they can refer to each other. The entries in a plan can either be consumer groups or subplans. For example, the following is also a set of valid CPU plan directives:

Table 85–2 MYDB PLAN CPU Plan Directives

Subplan/Group	CPU_Level 1
MAILDB Plan	30%
BUGDB Plan	70%

If these plan directives were in effect and there were an infinite number of runnable sessions in all consumer groups, then the MAILDB plan would be assigned 30% of the available CPU resources, while the BUGDB plan would be assigned 70% of the available CPU resources. Breaking this further down, sessions in the "Postman" consumer group would be run 12% (40% of 30%) of the time, while sessions in the "Online" consumer group would be run 56% (80% of 70%) of the time. Figure 85–1 diagram depicts this scenario:

Figure 85–1 Resource Manager Scenario



Conceptually the active sessions are underneath the consumer groups. In other words, a session belongs to a resource consumer group, and this consumer group is used by a plan to determine allocation of processing resources.

A multiplan (plan with one or more subplans) definition of CPU plan directives cannot be collapsed into a single plan with one set of plan directives, because each plan is its own entity. The CPU quanta that is allotted to a plan or subplan gets used only within that plan, unless that plan contains no consumer groups with active sessions. Therefore, in this example, if the Bug Maintenance Group did not use any of its quanta, then it would get recycled within that plan, thus going back to level 1 within the BUGDB PLAN. If the multiplan definition in the preceding example got collapsed into a single plan with multiple consumer groups, then there would be no way to explicitly recycle the Bug Maintenance Group's unused quanta. It would have to be recycled globally, thus giving the mail sessions an opportunity to use it.

The resources for a database can be partitioned at a high level among multiple applications and then repartitioned within an application. If a given group within an

application does not need all the resources it is assigned, then the resource is only repartitioned within the same application.

The following example uses the default plan and consumer group allocation methods:

```
BEGIN
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'bugdb_plan',
   COMMENT => 'Resource plan/method for bug users sessions');
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'maildb_plan',
   COMMENT => 'Resource plan/method for mail users sessions');
DBMS_RESOURCE_MANAGER.CREATE_PLAN(PLAN => 'mydb_plan',
   COMMENT => 'Resource plan/method for bug and mail users sessions');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Bug_Online_group',
   COMMENT => 'Resource consumer group/method for online bug users sessions');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Bug_Batch_group',
COMMENT => 'Resource consumer group/method for bug users sessions who run batch
jobs');
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP(CONSUMER_GROUP => 'Bug_Maintenance_
group',
   COMMENT => 'Resource consumer group/method for users sessions who maintain
   the bug  db');

Summary of DBMS_RESOURCE_MANAGER Subprograms

Table 85–3 DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
CLEAR_PENDING_AREA Procedure on page 85-11	Clears the work area for the resource manager
CREATE_CONSUMER_ GROUP Procedure on page 85-12	Creates entries which define resource consumer groups
CREATE_PENDING_AREA Procedure on page 85-13	Creates a work area for changes to resource manager objects
CREATE_PLAN Procedure on page 85-15	Creates entries which define resource plans
CREATE_PLAN_DIRECTIVE Procedure on page 85-16	Creates resource plan directives
CREATE_SIMPLE_PLAN Procedure on page 85-18	Creates a single-level resource plan containing up to eight consumer groups in one step
DELETE_CONSUMER_ GROUP Procedure on page 85-19	Deletes entries which define resource consumer groups
DELETE_PLAN Procedure on page 85-20	Deletes the specified plan as well as all the plan directives it refers to
DELETE_PLAN_CASCADE Procedure on page 85-21	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
DELETE_PLAN_DIRECTIVE Procedure on page 85-22	Deletes resource plan directives
SET_CONSUMER_GROUP_ MAPPING Procedure on page 85-23	Adds, deletes, or modifies pairs for the login and run-time attribute mappings
SET_CONSUMER_GROUP_ MAPPING_PRI Procedure on page 85-24	Creates the session attribute mapping priority list
SET_INITIAL_CONSUMER_ GROUP Procedure on page 85-25	Assigns the initial resource consumer group for a user
SUBMIT_PENDING_AREA Procedure on page 85-26	Submits pending changes for the resource manager
SWITCH_CONSUMER_ GROUP_FOR_SESS Procedure on page 85-27	Changes the resource consumer group of a specific session
SWITCH_CONSUMER_ GROUP_FOR_USER Procedure on page 85-28	Changes the resource consumer group for all sessions with a given user name
SWITCH_PLAN Procedure on page 85-29	Sets the current resource manager plan
UPDATE_CONSUMER_ GROUP Procedure on page 85-30	Updates entries which define resource consumer groups

Table 85–3 (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
UPDATE_PLAN Procedure on page 85-31	Updates entries which define resource plans
UPDATE_PLAN_DIRECTIVE Procedure on page 85-32	Updates resource plan directives
VALIDATE_PENDING_AREA Procedure on page 85-34	Validates pending changes for the resource manage

CLEAR_PENDING_AREA Procedure

This procedure lets you clear pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

CREATE_CONSUMER_GROUP Procedure

This procedure lets you create entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
   consumer_group  IN VARCHAR2,
   comment         IN VARCHAR2,
   cpu_mth         IN VARCHAR2 DEFAULT 'ROUND-ROBIN');
```

Parameters

Table 85–4 CREATE_CONSUMER_GROUP Procedure Parameters

Parameter	Description
consumer_group	The name of the consumer group.
comment	The user's comment.
cpu_mth	The resource allocation method for distributing CPU among sessions in the consumer group. The default is ROUND-ROBIN, which uses a round-robin scheduler to ensure sessions are fairly executed. RUN-TO-COMPLETION specifies that sessions with the largest active time are scheduled ahead of other sessions

CREATE_PENDING_AREA Procedure

This procedure lets you make changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you has made are valid. You do not have to do your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

> **Note:** Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

The following rules must be adhered to, and they are checked whenever the validate or submit procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- For Oracle8*i*, the plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 32 plan directives coming from any given plan (that is, no plan can have more than 32 children).
- There cannot be more than 32 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema.This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix the problem(s) and reissue the validate or submit procedures.

CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
   plan                      IN VARCHAR2,
   comment                   IN VARCHAR2,
   cpu_mth                   IN VARCHAR2 DEFAULT 'EMPHASIS',
   active_sess_pool_mth       IN VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
   parallel_degree_limit_mth  IN VARCHAR2 DEFAULT
                             'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
   queueing_mth              IN VARCHAR2 DEFAULT 'FIFO_TIMEOUT',);
```

Parameters

Table 85–5 CREATE_PLAN Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
comment	User's comment.
cpu_mth	The resource allocation method for specifying how much CPU each consumer group or sub plan gets. EMPHASIS, the default method, is for multilevel plans that use percentages to specify how CPU is distributed among consumer groups. RATIO is for single-level plans that use ratios to specify how CPU is distributed.
active_sess_pool_mth	The Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	The resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	The Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available

Usage Notes

If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

CREATE_PLAN_DIRECTIVE Procedure

This procedure lets you create resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
   plan                      IN VARCHAR2,
   group_or_subplan          IN VARCHAR2,
   comment                   IN VARCHAR2,
   cpu_p1                    IN NUMBER   DEFAULT NULL,
   cpu_p2                    IN NUMBER   DEFAULT NULL,
   cpu_p3                    IN NUMBER   DEFAULT NULL,
   cpu_p4                    IN NUMBER   DEFAULT NULL,
   cpu_p5                    IN NUMBER   DEFAULT NULL,
   cpu_p6                    IN NUMBER   DEFAULT NULL,
   cpu_p7                    IN NUMBER   DEFAULT NULL,
   cpu_p8                    IN NUMBER   DEFAULT NULL,
   active_sess_pool_p1       IN NUMBER   DEFAULT NULL,
   queueing_p1               IN NUMBER   DEFAULT NULL,
   parallel_degree_limit_p1  IN NUMBER   DEFAULT NULL,
   switch_group              IN VARCHAR2 DEFAULT NULL,
   switch_time               IN NUMBER   DEFAULT NULL,
   switch_estimate           IN BOOLEAN  DEFAULT FALSE,
   max_est_exec_time         IN NUMBER   DEFAULT NULL,
   undo_pool                 IN NUMBER   DEFAULT NULL,
   max_idle_time             IN NUMBER   DEFAULT NULL,
               max_idle_blocker_time     IN NUMBER   DEFAULT NULL,
               switch_time_in_call       IN NUMBER   DEFAULT NULL);
```

Parameters

Table 85–6 CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the consumer group or subplan.
comment	Comment for the plan directive.
cpu_p1	For EMPHASIS, specifies the CPU percentage at the first level. For RATIO, specifies the weight of CPU usage. Default is NULL for all CPU parameters.
cpu_p2	For EMPHASIS, specifies the CPU percentage at the second level. Not applicable for RATIO.
cpu_p3	For EMPHASIS, specifies the CPU percentage at the third level. Not applicable for RATIO.
cpu_p4	For EMPHASIS, specifies the CPU percentage at the fourth level. Not applicable for RATIO.
cpu_p5	For EMPHASIS, specifies the CPU percentage at the fifth level. Not applicable for RATIO.
cpu_p6	For EMPHASIS, specifies the CPU percentage at the sixth level. Not applicable for RATIO.
cpu_p7	For EMPHASIS, specifies the CPU percentage at the seventh level. Not applicable for RATIO.

Table 85–6 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
cpu_p8	For EMPHASIS, specifies the CPU percentage at the eighth level. Not applicable for RATIO.
active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
parallel_degree_ limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
switch_group	Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
switch_time	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
max_est_exec_time	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
undo_pool	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_ time	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
switch_time_in_call	Specifies time (in seconds) that a session can execute before an action is taken. At the end of the top call, the consumer group of the session is restored to its original consumer group. Default is NULL, which means unlimited. Both SWITCH_TIME_ IN_CALL and SWITCH_TIME cannot be specified.

Usage Notes

- All parameters default to NULL. However, for the EMPHASIS CPU resource allocation method, this case would starve all the users.
- For max_idle_time and max_idle_blocker_time, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter switch_time_in_call is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using switch_time_in_call, the resource usage of one client will not affect a future client that happens to be executed on the same session.

CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the CREATE_CONSUMER_GROUP and CREATE_RESOURCE_PLAN_DIRECTIVES procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
   SIMPLE_PLAN      IN  VARCHAR2  DEFAULT,
   CONSUMER_GROUP1  IN  VARCHAR2  DEFAULT,
   GROUP1_CPU       IN  NUMBER    DEFAULT,
   CONSUMER_GROUP2  IN  VARCHAR2  DEFAULT,
   GROUP2_CPU       IN  NUMBER    DEFAULT,
   CONSUMER_GROUP3  IN  VARCHAR2  DEFAULT,
   GROUP3_CPU       IN  NUMBER    DEFAULT,
   CONSUMER_GROUP4  IN  VARCHAR2  DEFAULT,
   GROUP4_CPU       IN  NUMBER    DEFAULT,
   CONSUMER_GROUP5  IN  VARCHAR2  DEFAULT,
   GROUP5_CPU       IN  NUMBER    DEFAULT,
   CONSUMER_GROUP6  IN  VARCHAR2  DEFAULT,
   GROUP6_CPU       IN  NUMBER    DEFAULT,
   CONSUMER_GROUP7  IN  VARCHAR2  DEFAULT,
   GROUP7_CPU       IN  NUMBER    DEFAULT,
   CONSUMER_GROUP8  IN  VARCHAR2  DEFAULT,
   GROUP8_CPU       IN  NUMBER    DEFAULT);
```

DELETE_CONSUMER_GROUP Procedure

This procedure lets you delete entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (
   consumer_group IN VARCHAR2);
```

Parameters

Table 85–7 DELETE_CONSUMER_GROUP Procedure Parameters

Parameters	Description
consumer_group	The name of the consumer group to be deleted.

DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (
   plan IN VARCHAR2);
```

Parameters

Table 85–8 DELETE_PLAN Procedure Parameters

Parameter	Description
plan	The name of the resource plan to delete.

DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (
   plan IN VARCHAR2);
```

Parameters

Table 85–9 DELETE_PLAN_CASCADE Procedure Parameters

Parameters	Description
plan	The name of the plan.

Usage Notes

If DELETE_PLAN_CASCADE encounters any error, then it rolls back, and nothing is deleted.

DELETE_PLAN_DIRECTIVE Procedure

This procedure lets you delete resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (
   plan              IN VARCHAR2,
   group_or_subplan  IN VARCHAR2);
```

Parameters

Table 85–10 DELETE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
`plan`	The name of the resource plan.
`group_or_subplan`	The name of the group or subplan.

SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(
   attribute       IN VARCHAR2,
   value            IN VARCHAR2,
   consumer_group  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 85–11 SET_CONSUMER_GROUP_MAPPING Procedure Parameters

Parameters	Description
`attribute`	The mapping attribute to add/modify. It can be one of the Constants listed.
`value`	The attribute value to match.
`consumer_group`	The name of the mapped consumer group, or `NULL` to delete a mapping.

Usage Notes

If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the `consumer_group` argument is `NULL`, then any mapping from the given attribute and value will be deleted.

SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI(
   explicit               IN NUMBER,
   oracle_user            IN NUMBER,
   service_name           IN NUMBER,
   client_os_user         IN NUMBER,
   client_program         IN NUMBER,
   client_machine         IN NUMBER,
   module_name            IN NUMBER,
   module_name_action     IN NUMBER,
   service_module         IN NUMBER,
   service_module_action  IN NUMBER);
```

Parameters

Table 85–12 SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

Parameters	Description
`explicit`	The priority of the explicit mapping.
`oracle_user`	The priority of the Oracle user name mapping.
`service_name`	The priority of the client service name mapping.
`client_os_user`	The priority of the client operating system user name mapping.
`client_program`	The priority of the client program mapping.
`client_machine`	The priority of the client machine mapping.
`module_name`	The priority of the application module name mapping.
`module_name_action`	The priority of the application module name and action mapping.
`service_module`	The priority of the service name and application module name mapping.
`module_name_action`	The priority of the service name, application module name, and application action mapping.

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
  - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 10. Together, they establish an ordering where 1 is the highest priority and 10 is the lowest.

SET_INITIAL_CONSUMER_GROUP Procedure

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs. This procedure sets the initial resource consumer group for a user.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
   user           IN VARCHAR2,
   consumer_group IN VARCHAR2);
```

Parameters

Table 85–13 SET_INITIAL_CONSUMER_GROUP Procedure Parameters

Parameters	Description
user	The name of the user.
consumer_group	The user's initial consumer group.

Usage Notes

The ADMINISTER_RESOURCE_MANAGER or the ALTER USER system privilege are required to be able to execute this procedure. The user, or PUBLIC, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

Note: These semantics are similar to those for ALTER USER DEFAULT ROLE.

If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: DEFAULT_CONSUMER_GROUP.

DEFAULT_CONSUMER_GROUP has switch privileges granted to PUBLIC; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have DEFAULT_CONSUMER_GROUP as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to DEFAULT_CONSUMER_GROUP.

SUBMIT_PENDING_AREA Procedure

This procedure lets you submit pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

> **Note:** A call to SUBMIT_PENDING_AREA may fail even if VALIDATE_PENDING_AREA succeeds. This may happen if a plan being deleted is loaded by an instance after a call to VALIDATE_PENDING_AREA, but before a call to SUBMIT_PENDING_AREA.

Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure lets you change the resource consumer group of a specific session. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (
   session_id      IN NUMBER,
   session_serial  IN NUMBER,
   consumer_group  IN VARCHAR2);
```

Parameters

Table 85–14 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

Parameter	Description
session_id	SID column from the view V$SESSION.
session_serial	SERIAL# column from view V$SESSION.
consumer_group	The name of the consumer group to switch to.

SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure lets you change the resource consumer group for all sessions with a given user ID. It also change the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
   user            IN VARCHAR2,
   consumer_group  IN VARCHAR2);
```

Parameters

Table 85–15 SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

Parameter	Description
`user`	The name of the user.
`consumer_group`	The name of the consumer group to switch to.

Usage Notes

The SWITCH_CONSUMER_GROUP_FOR_SESS Procedure and `SWITCH_CONSUMER_GROUP_FOR_USER` procedures let you to raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.

These procedures cause the session to be moved into the newly specified consumer group immediately.

SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
   plan_name                     IN   VARCHAR2,
   sid                           IN   VARCHAR2 DEFAULT '*',
   allow_scheduler_plan_switches IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 85–16 SWITCH_PLAN Procedure Parameters

Parameter	Description
plan_name	The name of the plan to which to switch. Passing in an empty string ('') for the plan_name, disables the resource manager
sid	The sid parameter is relevant only in a Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
allow_scheduler_ plan_switches	FALSE - disables automated plan switches by the job scheduler at window boundaries. To re-enable automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled.

UPDATE_CONSUMER_GROUP Procedure

This procedure lets you update entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
   consumer_group  IN VARCHAR2,
   new_comment     IN VARCHAR2 DEFAULT NULL,
   new_cpu_mth     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 85–17 UPDATE_CONSUMER_GROUP Procedure Parameter

Parameter	Description
consumer_group	The name of consumer group.
new_comment	New user's comment.
new_cpu_mth	The name of new method for CPU resource allocation.

Usage Notes

If the parameters to the UPDATE_CONSUMER_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
   plan                                IN VARCHAR2,
   new_comment                         IN VARCHAR2 DEFAULT NULL,
   new_cpu_mth                         IN VARCHAR2 DEFAULT NULL,
   new_active_sess_pool_mth            IN VARCHAR2 DEFAULT NULL,
   new_parallel_degree_limit_mth       IN VARCHAR2 DEFAULT NULL,
   new_queueing_mth                    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 85–18 UPDATE_PLAN Procedure Parameters

Parameter	Description
plan	The name of resource plan.
new_comment	New user's comment.
new_cpu_mth	The name of new allocation method for CPU resources.
new_active_sess_ pool_mth	The name of new method for maximum active sessions.
new_parallel_degree_ limit_mth	The name of new method for degree of parallelism.
new_queueing_mth	Specifies type of queuing policy to use with active session pool feature.

Usage Notes

- If the parameters to UPDATE_PLAN Procedure are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

UPDATE_PLAN_DIRECTIVE Procedure

This procedure lets you update resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
   plan                          IN VARCHAR2,
   group_or_subplan              IN VARCHAR2,
   new_comment                   IN VARCHAR2 DEFAULT NULL,
   new_cpu_p1                    IN NUMBER   DEFAULT NULL,
   new_cpu_p2                    IN NUMBER   DEFAULT NULL,
   new_cpu_p3                    IN NUMBER   DEFAULT NULL,
   new_cpu_p4                    IN NUMBER   DEFAULT NULL,
   new_cpu_p5                    IN NUMBER   DEFAULT NULL,
   new_cpu_p6                    IN NUMBER   DEFAULT NULL,
   new_cpu_p7                    IN NUMBER   DEFAULT NULL,
   new_cpu_p8                    IN NUMBER   DEFAULT NULL,
   new_active_sess_pool_p1       IN NUMBER   DEFAULT NULL,
   new_queueing_p1               IN NUMBER   DEFAULT NULL,
   new_parallel_degree_limit_p1  IN NUMBER   DEFAULT NULL,
   new_switch_group              IN VARCHAR2 DEFAULT NULL,
   new_switch_time               IN NUMBER   DEFAULT NULL,
   new_switch_estimate           IN BOOLEAN  DEFAULT FALSE,
   new_max_est_exec_time         IN NUMBER   DEFAULT NULL,
   new_undo_pool                 IN NUMBER   DEFAULT NULL,
   new_max_idle_time             IN NUMBER   DEFAULT NULL,
   new_max_idle_blocker_time     IN NUMBER   DEFAULT NULL,
   new_switch_time_in_call       IN NUMBER   DEFAULT NULL);
```

Parameters

Table 85–19 UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	The name of the resource plan.
group_or_subplan	The name of the consumer group or subplan.
new_comment	Comment for the plan directive.
new_cpu_p1	For EMPHASIS, specifies the CPU percentage at the first level. For RATIO, specifies the weight of CPU usage. Default is NULL for all CPU parameters.
new_cpu_p2	For EMPHASIS, specifies the CPU percentage at the second level. Not applicable for RATIO.
new_cpu_p3	For EMPHASIS, specifies the CPU percentage at the third level. Not applicable for RATIO.
new_cpu_p4	For EMPHASIS, specifies the CPU percentage at the fourth level. Not applicable for RATIO.
new_cpu_p5	For EMPHASIS, specifies the CPU percentage at the fifth level. Not applicable for RATIO.
new_cpu_p6	For EMPHASIS, specifies the CPU percentage at the sixth level. Not applicable for RATIO.
new_cpu_p7	For EMPHASIS, specifies the CPU percentage at the seventh level. Not applicable for RATIO.

Table 85–19 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
new_cpu_p8	For EMPHASIS, specifies the CPU percentage at the eighth level. Not applicable for RATIO.
new_active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
new_queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
new_switch_group	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
new_switch_time	Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
new_switch_estimate	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
new_max_est_exec_time	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
new_undo_pool	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
new_parallel_degree_limit_p1	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
new_max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
new_max_idle_blocker_time	The maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource.
new_switch_time_in_call	Specifies time (in seconds) that a session can execute before an action is taken. At the end of the top call, the consumer group of the session is restored to its original consumer group. Default is NULL, which means unlimited. Both SWITCH_TIME_IN_CALL and SWITCH_TIME cannot be specified.

Usage Notes

- If the parameters for UPDATE_PLAN_DIRECTIVE are left unspecified, then they remain unchanged in the data dictionary.
- For new_max_idle_time and new_max_idle_blocker_time, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter new_switch_time_in_call is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on new_switch_time_in_call, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.

VALIDATE_PENDING_AREA Procedure

This procedure lets you validate pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

86

DBMS_RESOURCE_MANAGER_PRIVS

The DBMS_RESOURCE_MANAGER_PRIVS package maintains privileges associated with the Resource Manager.

> **See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

Table 86–1 DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms

Subprogram	Description
GRANT_SWITCH_ CONSUMER_GROUP Procedure on page 86-3	Grants the privilege to switch to resource consumer groups
GRANT_SYSTEM_PRIVILEGE Procedure on page 86-4	Performs a grant of a system privilege
REVOKE_SWITCH_ CONSUMER_GROUP Procedure on page 86-5	Revokes the privilege to switch to resource consumer groups.
REVOKE_SYSTEM_PRIVILEGE Procedure on page 86-6	Performs a revoke of a system privilege

GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
   grantee_name   IN VARCHAR2,
   consumer_group IN VARCHAR2,
   grant_option   IN BOOLEAN);
```

Parameters

Table 86–2 GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the grant_option parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also: Chapter 85, "DBMS_RESOURCE_MANAGER"

Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
 'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
   grantee_name   IN VARCHAR2,
   privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
   admin_option   IN BOOLEAN);
```

Parameters

Table 86–3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
privilege_name	Name of the privilege to be granted.
admin_option	TRUE if the grant is with admin_option, FALSE otherwise.

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: ADMINISTER_RESOURCE_MANAGER. Database administrators have this system privilege with the ADMIN option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the ADMIN option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called scott without the ADMIN option:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
 grantee_name => 'scott',
 privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
 admin_option => FALSE);
END;
/
```

REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
   revokee_name   IN VARCHAR2,
   consumer_group IN VARCHAR2);
```

Parameters

Table 86–4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the DEFAULT_CONSUMER_GROUP consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from PUBLIC, then any users who could previously only use the consumer group through PUBLIC will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to mail_maintenance_group from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
 'scott', 'mail_maintenance_group');
END;
/
```

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
   revokee_name   IN VARCHAR2,
   privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

Table 86–5 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`revokee_name`	Name of the user or role from whom privilege is to be revoked.
`privilege_name`	Name of the privilege to be revoked.

Examples

The following call revokes the `ADMINISTER_RESOURCE_MANAGER` from user scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```

87

DBMS_RESUMABLE

With the DBMS_RESUMABLE package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

Using DBMS_RESUMABLE

Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DMBS_RESUMABLE.ABORT()` procedure.

Summary of DBMS_RESUMABLE Subprograms

Table 87–1 DBMS_RESUMABLE Package Subprograms

Subprogram	Description
ABORT Procedure on page 87-5	Aborts a suspended resumable space allocation
GET_SESSION_TIMEOUT Function on page 87-6	Returns the current timeout value of the resumable space allocations for a session with `session_id`
GET_TIMEOUT Function on page 87-7	Returns the current timeout value of resumable space allocations for the current session
SET_SESSION_TIMEOUT Procedure on page 87-8	Sets the timeout of resumable space allocations for a session with `session_id`
SET_TIMEOUT Procedure on page 87-9	Sets the timeout of resumable space allocations for the current session
SPACE_ERROR_INFO Function on page 87-10	Looks for space-related errors in the error stack, otherwise returning `FALSE`

ABORT Procedure

This procedure aborts a suspended resumable space allocation. The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (
   session_id  IN NUMBER);
```

Parameters

Table 87–2 ABORT Procedure Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.

Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (
   session_id  IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 87–3 GET_SESSION_TIMEOUT Function Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.

Return Values

Table 87–4 GET_SESSION_TIMEOUT Function Return Values

Return Value	Description
`NUMBER`	The current timeout value of resumable space allocations for a session with session_id.The timeout is returned in seconds.

Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT
 RETURN NUMBER;
```

Return Values

Table 87–5 GET_TIMEOUT Function Return Values

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

Usage Notes

If the current session is not resumable enabled, the GET_TIMEOUT function returns -1.

SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`. The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (
   session_id  IN NUMBER,
   timeout     IN NUMBER);
```

Parameters

Table 87–6 SET_SESSION_TIMEOUT Procedure Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.
`timeout`	The timeout of the resumable space allocation.

SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (
   timeout  IN NUMBER);
```

Parameters

Table 87–7 SET_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The timeout of the resumable space allocation.

SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack. If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
   error_type        OUT VARCHAR2,
   object_type       OUT VARCHAR2,
   object_owner      OUT VARCHAR2,
   table_space_name  OUT VARCHAR2,
   object_name       OUT VARCHAR2,
   sub_object_name   OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 87–8 SPACE_ERROR_INFO Function Parameters

Parameter	Description
`error_type`	The space error type. It will be one of the following: ■ `NO MORE SPACE` ■ `MAX EXTENTS REACHED` ■ `SPACE QUOTA EXCEEDED`
`object_type`	The object type. It will be one of the following: ■ TABLE ■ INDEX ■ CLUSTER ■ TABLE SPACE ■ ROLLBACK SEGMENT ■ UNDO SEGMENT ■ LOB SEGMENT ■ TEMP SEGMENT ■ INDEX PARTITION ■ TABLE PARTITION ■ LOB PARTITION ■ TABLE SUBPARTITION ■ INDEX SUBPARTITION ■ LOB SUBPARTITION The type can also be `NULL` if it does not apply.
`object_owner`	The owner of the object. `NULL` if it cannot be determined.
`table_space_name`	The table space where the object resides. `NULL` if it cannot be determined.
`object_name`	The name of rollback segment, temp segment, table, index, or cluster.
`sub_object_name`	The partition name or sub-partition name of `LOB, TABLE,` or `INDEX. NULL` if it cannot be determined.

88

DBMS_RLMGR

The DBMS_RLMGR package contains various procedures to create and manage rules and rule sessions by the Rules Manager.

> **See Also:** *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information.

This chapter contains the following topic:

- Summary of Rules Manager Subprograms

Summary of Rules Manager Subprograms

Table 88–1 describes the subprograms in the DBMS_RLMGR package.

All the values and names passed to the procedures defined in the DBMS_RLMGR package are case insensitive unless otherwise mentioned. In order to preserve the case, double quotation marks should be used around the values.

Table 88–1 DBMS_RLMGR Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the event structure (also the Expression Filter attribute set)
ADD_EVENT Procedures	Adds an event to a rule class in an active session
ADD_FUNCTIONS Procedure	Adds a Function, a Type, or a Package to the approved list of functions with an event structure (also the Expression Filter attribute set)
ADD_RULE Procedure	Adds a rule to the rule class
CONSUME_EVENT Function	Consumes an event using its identifiers and prepares the corresponding rule for action execution
CONSUME_PRIM_EVENTS Function	Consumes one or more primitive events with all or none semantics
CREATE_EVENT_STRUCTURE Procedure	Creates an event structure
CREATE_RULE_CLASS Procedure	Creates a rule class
DELETE_RULE Procedure	Deletes a rule from a rule class
DROP_EVENT_STRUCTURE Procedure	Drops an event structure
DROP_RULE_CLASS Procedure	Drops a rule class
GRANT_PRIVILEGE Procedure	Grants a privilege on a rule class to another user
PROCESS_RULES Procedure	Process the rules for a given event
RESET_SESSION Procedure	Starts a new rule session within a database session
REVOKE_PRIVILEGE Procedure	Revokes a privilege on a rule class from a user

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to an event structure, which is also the Expression Filter attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              attr_type      IN   VARCHAR2,
              attr_defvl     IN   VARCHAR2 default NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the event structure:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              tab_alias      IN   rlm$table_alias);
```

Parameters

Table 88–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
`event_struct`	Name of the event structure or attribute set to which this attribute is added
`attr_name`	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
`attr_type`	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
`tab_alias`	The type that identifies the database table to which the attribute is aliased
`attr_defv1`	Default value for the elementary attribute

Usage Notes

- This procedure adds an elementary attribute to an event structure. The event structure is internally managed as the Expression Filter attribute set. If the event structure was originally created from an existing object type, then additional attributes cannot be added.

  Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions, which is equivalent to an event structure that is used for a rule class.

- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a `ROWID` from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see Appendix A in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter*.

- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.

Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                               event_struct  => 'HRAttrSet',
                               attr_name => 'HRREP',
                               attr_type => 'VARCHAR2(30)');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                               event_struct  => 'HRAttrSet',
                               attr_name => 'DEPT',
                               tab_alias => exf$table_alias('DEPT'));
END;
```

ADD_EVENT Procedures

This procedure adds a primitive event to a rule class in an active rule session. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds a string representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
   rule_class      IN VARCHAR2,
   event_inst      IN VARCHAR2,
   event_type      IN VARCHAR2 default null);
```

Adds an AnyData representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
   rule_class      IN VARCHAR2,
   event_inst      IN sys.AnyData);
```

Parameters

Table 88–3 ADD_EVENT Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to add a primitive or a simple event to a rule class within an active rule session. By default, a rule session is the same as the database session. Optionally, multiple (sequential) rule sessions can be started within a database session by using the RESET_SESSION or PROCESS_RULES procedures.
- When the rule class is configured for simple events (consisting of only one primitive event structure), the event_type argument for the ADD_EVENT procedure can be ignored. Also, when the AnyData format of the event instance is passed, the event type information is embedded in the AnyData instance. In all other cases, the name of the primitive event structure being added to the rule class should be assigned to the event_type argument.
- For a valid event instance, the ADD_EVENT procedure processes the rules in the rule class and captures the results in the rule class results view (configured at the time of rule class creation). These results are preserved until the end of the rule session.
- When schema extended name is used for the rule class, you should have PROCESS RULES privilege on the rule class. See the GRANT_PRIVILEGE Procedure for additional information. The value specified for the event_type argument is always resolved in the rule class owner's schema and should not use schema extended names. When a composite event structure is configured with a table alias

primitive event type, the name of the corresponding table should be assigned to the `event_type` argument.

Examples

The following commands add two events to the CompTravelPromo rule class that is configured for two types of primitive events (AddFlight and AddRentalCar).

```
BEGIN
 DBMS_RLMGR.ADD_EVENT(rule_class => 'CompTravelPromo',
                      event_inst =>
                         AddFlight.getVarchar(987, 'Abcair', 'Boston',
                                              'Orlando', '01-APR-2003', '08-APR-2003'),
                      event_type => 'AddFlight');

DBMS_RLMGR.ADD_EVENT(rule_class => 'Scott.CompTravelPromo',
                      event_inst =>
                         AnyData.convertObject(
                                        AddRentalCar(987, 'Luxury', '03-APR-2003',
                                                     '08-APR-2003', NULL)));
END;
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the event structure, which is also the Expression Filter attribute set.

Syntax

```
DBMS_RLMGR.ADD_FUNCTIONS (
   event_struct   IN   VARCHAR2,
   funcs_name     IN   VARCHAR2);
```

Parameters

Table 88–4 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
`event_struct`	Name of the event structure to which the functions are added
`funcs_name`	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle supplied SQL functions for use in the rule conditions. If the expression set refers to a user-defined function, the expression set must be explicitly added to the attribute set.
- The `ADD_FUNCTIONS` procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list.
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the rule condition are considered valid. The conditional expression can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See "Defining Attribute Sets" in *Oracle Database Application Developer's Guide - Rules Manager and Expression Filter* for more information about adding functions to an attribute set.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ASET_FUNCTIONS`

Examples

The following commands add two functions to the attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_FUNCTIONS (attr_set   => 'Car4Sale',
                            funcs_name => 'HorsePower');
  DBMS_RLMGR.ADD_FUNCTIONS (attr_set   => 'Car4Sale',
                            funcs_name => 'Scott.CrashTestRating');
END;
```

ADD_RULE Procedure

This procedure adds new rules to a rule class.

Syntax

```
DBMS_RLMGR.ADD_RULE (
   rule_class      IN  VARCHAR2,
   rule_id         IN  VARCHAR2,
   rule_cond       IN  VARCHAR2,
   actprf_nml      IN  VARCHAR2 DEFAULT NULL,
   actprf_vall     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 88–5 ADD_RULE Procedure Parameters

Parameter	Description
`rule_class`	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
`rule_id`	Unique identifier for the rule within the rule class
`rule_cond`	The condition for the rule. The condition uses the variables defined in the rule class's event structure.
`actprf_nml`	The list of action preference names for which values will be assigned through the `actprf_vall` argument
`actprf_vall`	The list of action preference values for the names list assigned to the `actprf_nml` argument

Usage Notes

- This procedure is used to add new rules to the rule class. The rule condition passed to the `ADD_RULE` procedure is validated using the event structure associated with the rule class. The action preferences names list is a subset of action preference categories configured during rule class creation.
- When schema extended name is used for the rule class, you should have `ADD RULE` privilege on the rule class. See the GRANT_PRIVILEGE Procedure for more information.
- Alternately, the owner of the rule class can add the rules using SQL `INSERT` statement on the rule class table (that shares the same name as the rule class). Note that the owner of the rule class can also grant direct DML privileges on the rule class table to other users.

  Note: The AUTOCOMMIT property of the rule class is ignored if the new rules are added using the SQL INSERT statement instead of the ADD_RULE procedure.

- See the CREATE_RULE_CLASS Procedure procedure for the structure of the rule class table.

Examples

The following command adds a rule to the rule class.

```
BEGIN
DBMS_RLMGR.ADD_RULE (
           rule_class => 'CompTravelPromo',
           rule_id => 'AB_AV_FL',
           rule_cond =>
             '<condition>
                 <and join="Flt.CustId = Car.CustId">
                    <object name="Flt">
                      Airline=''Abcair'' and ToCity=''Orlando''
                    </object>
                    <object name="Car">
                      CarType = ''Luxury''
                    </object>
                  </and>
               </condition>' ,
             actprf_nml => 'PromoType, OfferedBy',
             actprf_vall => '''RentalCar'', ''Acar''');
END;
```

With proper privileges, the following SQL INSERT statement can be used to add the rule to the rule class.

```
INSERT INTO CompTravelPromo (rlm$ruleid, rlm$rulecond, PromoType, OfferedBy)
  VALUES ('AB_AV_FL',
          '<condition>
             <and join="Flt.CustId = Car.CustId">
               <object name="Flt">
                   Airline=''Abcair'' and ToCity=''Orlando''
               </object>
               <object name="Car">
                   CarType = ''Luxury''
               </object>
             </and>
           </condition>',
          'RentalCar','Acar');
```

CONSUME_EVENT Function

This function consumes an event and prepares the corresponding rule for action execution. This is required only when the action (or rule execution) is carried by the user's application and not in the callback.

Syntax

```
DBMS_RLMGR.CONSUME_EVENT (
   rule_class       IN VARCHAR2,
   event_ident      IN VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 88–6 CONSUME_EVENT Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifier obtained from the corresponding rule class results view (or arguments of the action callback procedure in the case of rule class configured for RULE based consumption policy)

Returns

The function returns:

- 1 -- If the event is successfully consumed.
- 0 -- If the event is expired (owing to duration policy) or consumed by another session prior to this call.

Usage Notes

- When an EXCLUSIVE consumption policy is set for the events in a rule class, an event must be deleted from the system immediately after the rule it matched is executed (action is executed). When the rule action is carried in the rule class callback procedure by calling the PROCESS_RULES procedure, the rule manager automatically handles the consumption of the events. However, when you request the results from matching events with rules in a rule class results view using the ADD_EVENT procedure, you should take appropriate action to indicate the exact rule-event combination that is to be used for rule execution. The CONSUME_EVENT procedure performs the required housekeeping services when the unique identifier for the event used in a rule execution is passed in.
- Since there could be a time lag between fetching the rule class matching results and the execution of the user initiated action, the application should execute the action only if the CONSUME_EVENT call succeeds in consuming the event. This avoids any race condition with parallel sessions trying to consume the same events. When the event is successfully consumed, this call returns 1. In all other cases, it returns 0. A return value of 0 implies that the event is already consumed by another session and hence it is not available for this session.
- The CONSUME_EVENT procedure deletes the events configured with EXCLUSIVE consumption policy and does nothing for events configured for 4 consumption policy.

- Unlike the EXCLUSIVE and SHARED consumption policies, which are determined at the rule class level, a RULE consumption policy can be used to determine the consumption of an event on a rule by rule basis. That is a subset of the rules in a rule class may be configured such that when they are matched, the event is deleted from the system. At the same time the other set of rules could leave the event in the system even after executing the corresponding action. In this scenario, the action callback procedure implemented by the application developer can call CONSUME_EVENT function (with appropriate arguments) to conditionally consume the event for certain rules. Also see the use of CONSUME_PRIM_EVENTS Function for rule classes configured for RULE consumption policy

Examples

The following commands identify an event that is used for a rule execution and consumes it using its identifier.

```
var eventid VARCHAR(40);
var evtcnsmd NUMBER;

BEGIN
  SELECT rlm$eventid INTO :eventid FROM MatchingPromos WHERE rownum < 2;

  -- carry the required action for a rule matched by the above event --
  :evtcnsmd := DBMS_RLMGR.CONSUME_EVENT(rule_class  => 'TravelPromotion',
                                        event_ident => :eventid);
END;
```

CONSUME_PRIM_EVENTS Function

This function consumes a set of primitive events with all or nothing semantics in the case of a rule class configured with RULE based consumption policy.

Syntax

```
DBMS_RLMGR.CONSUME_PRIM_EVENTS (
   rule_class       IN VARCHAR2,
   event_idents     IN RLM$EVENTIDS)
 RETURN NUMBER;
```

Parameters

Table 88–7 CONSUME_PRIM_EVENTS Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifiers obtained from the corresponding rule class results view or the arguments of the action callback procedure

Returns

The function returns:

- 1 -- If all the events, the identifiers for which are passed in, are successfully consumed.
- 0 -- If one or more primitive event could not be consumed.

Usage Notes

When the rule class is configured for RULE based consumption policy, the CONSUME_PRIM_EVENTS function can be used to consume one or more primitive events that constitute a composite event. This operation will succeed only when all the events passed in are still valid and are available for consumption. Any user initiated action should be implemented after checking the return value of the CONSUME_PRIM_EVENTS call.

Examples

The following commands show the body of the action callback procedure for a rule class configured for RULE consumption policy. This demonstrates the use of CONSUME_PRIM_EVENTS procedure to consume the events before executing the action for the matched rules.

```
create or replace procedure PromoAction (
      Flt        AddFlight,
      Flt_EvtId  ROWID,    --- rowid for the flight primitive event
      Car        AddRentalCar,
      Car_EvtId  ROWID,
      rlm$rule   TravelPromotions%ROWTYPE) is
  evtcnsmd   NUMBER;
BEGIN
  evtcnsmd := DBMS_RLMGR.CONSUME_PRIM_EVENTS(
                   rule_class   => 'TravelPromotions',
                   event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));
```

```
  if (evtcnsmd = 1) then
    -- consume operation was successful; perform the action ---
    OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
  end if;
END;
```

CREATE_EVENT_STRUCTURE Procedure

This procedure creates an event structure.

Syntax

```
DBMS_RLMGR.CREATE_EVENT_STRUCTURE  (
   event_struct  IN  VARCHAR2);
```

Parameters

Table 88–8 CREATE_EVENT_ STRUCTURE Procedure Parameter

Parameter	Description
event_struct	Name of the event structure to be created in the current schema

Usage Notes

This procedure creates a dummy the event structure in the current schema. One or more attributes can be added to this event structure using the ADD_ELEMENTARY_ATTRIBUTE procedure.

Examples

The following command creates the event structure.

```
BEGIN
  DBMS_RLMGR.CREATE_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

CREATE_RULE_CLASS Procedure

This procedure creates a rule class.

Syntax

```
DBMS_RLMGR.CREATE_RULE_CLASS  (
   rule_class      IN  VARCHAR2,
   event_struct    IN  VARCHAR2,
   action_cbk      IN  VARCHAR2,
   actprf_spec     IN  VARCHAR2  default null,
   rslt_viewnm     IN  VARCHAR2  default null,
   rlcls_prop      IN  VARCHAR2  default <simple/>);
```

Parameters

Table 88–9 CREATE_RULE_CLASS Procedure Parameters

Parameter	Description
rule_class	The name of the rule class to be created in the current schema
event_struct	The name of the object type or an Expression Filter attribute set in the current schema that represents the event structure for the rule class
action_cbk	The name of the action callback procedure to be created for the rule class
actprf_spec	The specification (name and SQL datatype pairs) for the action preferences associated with the rule class
rlst_viewnm	The name of the rule class results view that lists the matching events and rules within a session. A view with this name is created in the current schema.
rlcls_prop	The XML document for setting the rule class properties. By default, the rule class created is for simple events (non-composite).

Usage Notes

- For successful creation of a rule class, you should have sufficient privileges to create views, object types, tables, packages, and procedures.
- This command creates the rule class and its dependent objects in the user's schema. For this operation to succeed the name specified for the event structure should refer to an existing object type or an Expression Filter attribute set in the user's schema. When an object type is used for an event structure, the CREATE_RULE_CLASS procedure implicitly creates an attribute set for the object type. In the case of a rule class configured for composite events, the previous procedure also creates attribute sets for the object types that are directly embedded in the event structure's object type (or the attribute set). A maximum of 32 embedded objects (and/or table aliases) can be specified with an event structure that is used for a composite rule class. The types of dependent objects created with this procedure and their structure depend on the properties of the rule class and its event structure. The minimum set of dependent objects created for a rule class is as follows:
  - Rule class table – A rule class table that shares the name of the rule class is created in the user's schema to store the rule definitions (rule identifiers, rule conditions, rule descriptions, and action preferences). This table implicitly has three columns, rlm$ruleid, rlm$rulecond, and rlm$ruledesc to store the rule identifiers, rule conditions, and rule descriptions respectively. In addition to

these three columns, the rule class table has few columns according to the rule classes' access preference specification. For example, if a TravelPromotion rule class uses 'PromoType VARCHAR(20), OfferedBy VARCHAR(20)' as its access preference specification (assigned to actpref_spec argument), the rule class table is created with the following structure.

```
TABLE TravelPromotion (
      rlm$ruleid VARCHAR(100),     -- rule identifier column --
      PromoType VARCHAR(20),       -- access preference 1 --
      OfferedBy VARCHAR(20),       -- access preference 2 --
      rlm$rulecond VARCHAR(4000),  -- rule condition --
      rlm$ruledesc VARCHAR(1000)); -- rule description --
```

The rule class table structure varies from one rule class to another based on the exact list of action preference categories specified for the rule class.

– Action Callback Procedure – The skeleton for the action callback procedure with the given name is created in the user's schema and it is associated with the rule class. During rule evaluation, the callback procedure is called for each matching rule and event. You should implement the body of the action callback procedure to perform the appropriate action for each rule. The exact action for a rule can be determined based on the event that matched the rule and rule definition along with its action preferences. This information is passed to the action callback procedure through its arguments. Hence, the argument list for the action callback procedure depends on the event structure associated with the rule class and the rule class itself.

  In the case of a rule class configured for simple events (<simple/> assigned to the properties of the rule class), the event that matches a rule is passed through a rlm$event argument that is declared to be of the same type as the event structure. Additionally, the rule definitions are passed to the action callback procedure using an rlm$rule argument that is declared as ROWTYPE of the corresponding rule class table. For example, the structure of the PromoAction action callback procedure created for a TravelPromotion rule class configured for a simple (non-composite) AddFlight event structure is as follows:

```
PROCEDURE PromoAction (rlm$event AddFlight,
                       rlm$rule TravlePromotion%ROWTYPE);
```

  In the case of a rule class created for composite events (<composite/> assigned to the properties of the rule class), the action callback procedure is created to pass each primitive event as a separate argument. For example, the CompPromoAction action callback procedure created for a rule class CompTravelPromo configured for a composite event with AddFlight and AddRentalCar primitive events are shown as follows:

```
-- composite event structure --
TYPE TSCompEvent (Flt AddFlight,
                  Car AddRentalCar);
-- corresponding action callback procedure --
PROCEDURE PromoAction (Flt AddFlight,
                       Car AddRentalCar,
                       rlm$rule CompTravelPromo%ROWTYPE)
```

– Rule class results view – A view to display the results from matching some events with rules is created in the same schema as the rule class. By default, this view is created with a system-generated name. Optionally, the rule class creator can specify a name for this view with the rlst_viewnm argument of

the CREATE_RULE_CLASS procedure. When the events are added to the rule manager within a rule session using the ADD_EVENT procedure, the list of matching events and rules are displayed in the rule class results view.

The structure of the view defined for the rule class results depends on the event structure and the action preferences configured with the rule class. Minimally, the view has three columns to display the system generated event identifier (rlm$evenetid), the identifier of the rule it matches (rlm$ruleid), and the rule condition (rlm$rulecond). Additionally, it has columns to display the event information and the rule action preferences.

In the case of a rule class configured for simple events, the event information is displayed as rlm$event that is declared to be of the event structure type. So, a MatchingPromos view created for the TravelPromotion rule class configured for a simple AddFlight event structure is as follows:

```
VIEW MatchingPromos (
    rlm$eventid ROWID,
    rlm$event AddFlight,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

In the case of a rule class configured for composite events, the primitive events matching a rule are displayed separately using corresponding columns. For the above CompTravelPromo rule class, a MatchingCompPromos view is created with the following structure.

```
VIEW MatchingCompPromos (
    rlm$eventid ROWID,
    Flt AddFlight,
    Car AddRentalCar,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30),   -- action preference 1 --
    OffredBy VARCHAR(30),    -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

The values from the rlm$eventid column are used to enforce rule class consumption policies when the corresponding rule is executed. See the CONSUME_EVENT Function procedure for more information.

Examples

The following commands create a rule class for simple events (of AddFlight type).

```
CREATE or REPLACE TYPE AddFlight AS OBJECT (
                  CustId NUMBER,
                  Airline VARCHAR(20),
                  FromCity VARCHAR(30),
                  ToCity VARCHAR(30),
                  Depart DATE,
                  Return DATE);
BEGIN
  DBMS_RLMGR.CREATE_RULE_CLASS (
             rule_class   => 'TravelPromotion', -- rule class name --
             event_struct => 'AddFlight', -- event struct name --
```

```
              action_cbk    => 'PromoAction', -- callback proc name --
              rslt_viewnm   => 'MatchingPromos', -- results view --
              actprf_spec   => 'PromoType VARCHAR(20),
                                OfferedBy VARCHAR(20)');
END;
```

The following commands create a rule class for composite events consisting of two primitive events (AddFlight and AddRentalCar).

```
CREATE or REPLACE TYPE TSCompEvent (Flt AddFlight,
                                    Car AddRentalCar);
BEGIN
  DBMS_RLMGR.CREATE_RULE_CLASS (
              rule_class    => 'CompTravelPromo', -- rule class name --
              event_struct  => 'TSCompEvent', -- event struct name --
              action_cbk    => 'CompPromoAction', -- callback proc name --
              rslt_viewnm   => 'MatchingCompPromos', -- results view --
              actprf_spec   => 'PromoType VARCHAR(20),
                                OfferedBy VARCHAR(20)',
              properties    => '<composite/>');
END;
```

DELETE_RULE Procedure

This procedure deletes a rule from a rule class.

Syntax

```
DBMS_RLMGR.DELETE_RULE (
   rule_class    IN    VARCHAR2,
   rule_id       IN    VARCHAR2);
```

Parameters

Table 88–10 DELETE_RULE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Identifier for the rule to be deleted

Usage Notes

- This procedure is used to delete a rule from the rule class. The identifier for the rule to be deleted can be obtained by querying the rule class table (that shares the same name as the rule class). Alternately, the owner of the rule class can use a SQL DELETE statement on one rule class table to delete a rule.
- When schema extended name is used for the rule class, you should have DELETE RULE privilege on the rule class. See the GRANT_PRIVILEGE Procedure procedure for more information.

  Note: AUTOCOMMIT property of the rule class is ignored if the rules are deleted with the SQL DELETE statement instead of the DELETE_RULE procedure.

- See the CREATE_RULE_CLASS Procedure procedure for the structure of the rule class table.

Examples

The following command deletes a rule from the rule class.

```
BEGIN
  DBMS_RLMGR.DELETE_RULE (
           rule_class  => 'CompTravelPromo',
           rule_id     => 'AB_AV_FL');
END;
```

Alternately, the following SQL DELETE statement can be issued to delete the above rule from the rule class.

```
DELETE FROM CompTravelPromo WHERE rlm$ruleid = 'AB_AV_FL';
```

DROP_EVENT_STRUCTURE Procedure

This procedure drops an event structure.

Syntax

```
DBMS_RLMGR.DROP_EVENT_STRUCTURE  (
   event_struct  IN  VARCHAR2);
```

Parameters

Table 88–11 DROP_EVENT_ STRUCTURE Procedure Parameter

Parameter	Description
event_struct	Name of the event structure in the current schema

Usage Notes

This procedure drops the event structure from the current schema. This drops all the dependent objects created to manage the event structure.

Examples

The following command drops the event structure.

```
BEGIN
  DBMS_RLMGR.DROP_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

DROP_RULE_CLASS Procedure

This procedure drops a rule class.

Syntax

```
DBMS_RLMGR.DROP_RULE_CLASS  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 88–12 DROP_RULE_CLASS Procedure Parameter

Parameter	Description
rule_class	The name of the rule class in the current schema

Usage Notes

This procedure drops the rule class from the current schema. This drops all the dependent objects created to manage the rule class. Because an event structure in a user's schema can be shared across multiple rule classes, the event structure is not dropped with this command. The DROP_EVENT_STRUCTURE API should be used for the composite event as well as the individual primitive events to cleanup unused event structures.

Examples

The following command drops the rule class.

```
BEGIN
  DBMS_RLMGR.DROP_RULE_CLASS(rule_class => 'CompTravelPromo');
END;
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on a rule class to another user.

Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   priv_type       IN  VARCHAR2,
   to_user         IN  VARCHAR2);
```

Parameters

Table 88–13 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	The name of the rule class in the current schema
priv_type	Type of rule class privilege to be granted
to_user	The user to whom the privilege is to be granted

Usage Notes

- This procedure grants appropriate privileges to a user who is not the owner of the rule class. The types of privileges that can be granted to a user are:
  - PROCESS RULES: A user with PROCESS RULES privilege on a rule class can process the rules in the rule class using the PROCESS_RULES procedure or the ADD_EVENT procedure. Also, the user with this privilege can select from the corresponding rule class results view.
  - ADD RULE: A user with ADD RULE privilege on a rule class can add rules to a rule class. Alternatively, the owner of the rule class can grant INSERT privileges on one rule class table to other users.
  - DELETE RULE: A user with DELETE RULE privilege on a rule class can delete rules from a rule class. Alternatively, the owner of the rule class can grant DELETE privileges on one rule class table to other users.
  - ALL: Granting the ALL privilege on a rule class is equivalent to granting all the above privileges on the rule class to the user.
- The owner of the rule class always has privileges to drop a rule class, process rules in a rule class, add rules and delete rules from a rules class. Only the owner of the rule class can drop a rule class and this privilege cannot be granted to another user.
- A user should also have EXECUTE privileges on the primitive event types associated with a rule class in order to make use of the corresponding rule class results view

Examples

The following command grants PROCESS RULES privilege on TravelPromo rule class to the user SCOTT.

```
BEGIN
  DBMS_RLMGR.GRANT_PRIVILEGE(rule_class => 'TravelPromo',
                             priv_type => 'PROCESS RULES',
```

```
                                    to_user => 'SCOTT');
END;
```

PROCESS_RULES Procedure

This procedure processes the rules for a given event. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Processes the rules for a string representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES  (
   rule_class    IN  VARCHAR2,
   event_inst    IN  VARCHAR2,
   event_type    IN  VARCHAR2 default null);
```

Processes the rules for an AnyData representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES  (
   rule_class    IN  VARCHAR2,
   event_inst    IN  sys.AnyData);
```

Parameters

Table 88–14 PROCESS_RULES Procedure Parameters

Parameter	Description
`rule_class`	The name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
`event_inst`	String or AnyData representation of the event instance being added to the rule class
`event_type`	Type of event instance assigned to the `event_inst` argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to process the rules in a rule class for an event instance assigned to the `event_inst` argument.
- In the case of a rule class configured for simple events (non-composite), the event instance is an instantiation of the corresponding event structure. The rules are evaluated (conclusively) for this event and the corresponding action callback procedure is called for each matching rule. If the event does not match any rule, no further action is performed. If the event matches two or more rules, the ordering clause configured for the rule class is used to order them accordingly to invoke the action callback procedure. If the rule class is configured for `EXCLUSIVE` consumption policy, once the first rule in this order is executed (and the corresponding action callback procedure is called), the rest of the rules that matched the event are ignored.
- In the case of a rule class configured for composite events, the event instance assigned to the `event_inst` argument is an instantiation of one of the primitive type within the composite event. When the instance is represented as a string, the corresponding type name should be assigned to the `event_type` argument. The `PROCESS_RULES` call on a rule class configured for composite events performs

various actions depending on the state of the rule class and the kind of rules in the rule class.

- The rules operating only on the primitive event passed in are evaluated conclusively and the action callback procedure is called for the matching rules, as described in previous paragraph.
- In the case of a rule operating on more than one primitive event, the event instance passed through PROCESS_RULES procedure could match only a part of the rule.
  * If there is (are) another primitive event instance(s) that matches the rest of the rule, the current event instance is combined with the other instance(s) to form a complete composite event that matches a rule in the rule class. So, the event instance assigned to the event_inst argument of the PROCESS_RULES procedure could be combined with various other primitive events (previously processed) to evaluate one or more rules conclusively. The rule classes' action callback procedure is called for each such combination of primitive events (composite event) and the rule. The ordering clause for the rule class and the consumption policy for the primitive events in taken into account while invoking the action callback procedure.
  * If there is no other primitive event that matches the rest of the rule, the current event instance and its (incremental) evaluation results are recorded in the database. These results are preserved until either the event is consumed or deleted from the system owing to the duration policy used for the rule class.

Examples

The following command processes the rules in the TravelPromotion rule class for the given events.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES (
               rule_class => 'TravelPromotion',
               event_inst =>
                 AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                                      '01-APR-2003', '08-APR-2003'));
END;
```

The following commands process the rules in the CompTravelPromo rule class for the two primitive events shown.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES(
               rule_class => 'CompTravelPromo',
               event_inst =>
                 AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                                      '01-APR-2003', '08-APR-2003'),
               event_type => 'AddFlight');
  DBMS_RLMGR.PROCESS_RULES(
               rule_class => 'Scott.CompTravelPromo',
               event_inst =>
                  AnyData.convertObject(AddRentalCar(987, 'Luxury', '03-APR-2003',
                                        '08-APR-2003', NULL)));
END;
```

RESET_SESSION Procedure

This procedure starts a new session and thus discards the results in the rule class results view.

Syntax

```
DBMS_RLMGR.RESET_SESSION  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 88–15 RESET_SESSION Procedure Parameter

Parameter	Description
`rule_class`	The name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.

Usage Notes

- When the `ADD_EVENT` procedure is used to add events to the rule class, the results from matching rules with events are recorded in the rule class results view. By default, these results are reset at the end of the database session. Alternately, the RESET_SESSION Procedure can be used to reset and start a new rule session within a database session.
- This procedure is only applicable while using ADD_EVENT Procedures to evaluate the rules.

Examples

The following command resets a rule class session.

```
BEGIN
  DBMS_RLMGR.RESET_SESSION(
             rule_class => 'CompTravelPromo');
END;
```

REVOKE_PRIVILEGE Procedure

This procedure revokes privileges on a rule class from another user.

Syntax

```
DBMS_RLMGR.REVOKE_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   priv_type       IN  VARCHAR2,
   from_user       IN  VARCHAR2);
```

Parameters

Table 88–16 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
`rule_class`	The name of the rule class in the current schema
`priv_type`	Type of rule class privilege to be revoked
`from_user`	The user from whom the privilege is to be revoked

Usage Notes

This procedure revokes appropriate privileges from a user. The types of privileges that can be revoked are the same as the types listed in the GRANT_PRIVILEGE Procedure description. Rule class privileges cannot be revoked from the owner of the rule class.

Examples

The following command revokes `PROCESS RULES` privilege on `TravelPromo` rule class from the user `SCOTT`.

```
BEGIN
  DBMS_RLMGR.REVOKE_PRIVILEGE(rule_class  => 'TravelPromo',
                              priv_type   => 'PROCESS RULES',
                              from_user   => 'SCOTT');
END;
```

89

DBMS_RLS

The DBMS_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD). DBMS_RLS is available with the Enterprise Edition only.

> **See Also:** *Oracle Database Security Guide* for usage information on DBMS_RLS.

This chapter contains the following topics:

Using DBMS_RLS

Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (
   'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP_SEC function (under the HR schema). This function returns a predicate specific to the current user for the EMP_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP_SEC function. The server treats the EMPLOYEES table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer's right.

> **Note:** The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

DBMS_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP_POLICY with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', FALSE);
```

Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from v$vpd_policies.

A synonym can reference only a view or a table.

Summary of DBMS_RLS Subprograms

Table 89–1 DBMS_RLS Subprograms Package Subprograms

Subprogram	Description
ADD_GROUPED_POLICY Procedure on page 89-7	Adds a policy associated with a policy group
ADD_POLICY Procedure on page 89-9	Adds a fine-grained access control policy to a table, view, or synonym
ADD_POLICY_CONTEXT Procedure on page 89-13	Adds the context for the active application
CREATE_POLICY_GROUP Procedure on page 89-14	Creates a policy group
DELETE_POLICY_GROUP Procedure on page 89-15	Deletes a policy group
DISABLE_GROUPED_POLICY Procedure on page 89-16	Disables a row-level group security policy
DROP_GROUPED_POLICY Procedure on page 89-17	Drops a policy associated with a policy group
DROP_POLICY Procedure on page 89-18	Drops a fine-grained access control policy from a table, view, or synonym
DROP_POLICY_CONTEXT Procedure on page 89-19	Drops a driving context from the object so that it will have one less driving context
ENABLE_GROUPED_POLICY Procedure on page 89-20	Enables or disables a row-level group security policy
ENABLE_POLICY Procedure on page 89-21	Enables or disables a fine-grained access control policy
REFRESH_GROUPED_POLICY Procedure on page 89-22	Reparses the SQL statements associated with a refreshed policy
REFRESH_POLICY Procedure on page 89-23	Causes all the cached statements associated with the policy to be reparsed

ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY(
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   policy_group    VARCHAR2,
   policy_name     VARCHAR2,
   function_schema VARCHAR2,
   policy_function VARCHAR2,
   statement_types VARCHAR2,
   update_check    BOOLEAN,
   enabled         BOOLEAN,
   static_policy   IN BOOLEAN  FALSE,
   policy_type     IN BINARY_INTEGER NULL,
   long_predicate  IN BOOLEAN  FALSE,
   sec_relevant_cols IN VARCHAR2);
```

Parameters

Table 89–2 ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy; must be unique for the same table or view.
function_schema	The schema owning the policy function.
policy_function	The name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 89–4. Specifying any of these policy types overrides the value of static_policy.

Table 89–2 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
sec_relevant_cols_opt	Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See "Usage Notes" on page 89-11 for restrictions and additional information about this option.

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the CREATE_POLICY_GROUP Procedure on page 89-14.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, SYS_DEFAULT, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with EXEMPT ACCESS POLICY system privilege.
- If no object_schema is specified, the current log-on user schema is assumed.

ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 89-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
   object_schema            IN VARCHAR2 NULL,
   object_name              IN VARCHAR2,
   policy_name              IN VARCHAR2,
   function_schema          IN VARCHAR2 NULL,
   policy_function          IN VARCHAR2,
   statement_types          IN VARCHAR2 NULL,
   update_check             IN BOOLEAN  FALSE,
   enable                   IN BOOLEAN  TRUE,
   static_policy            IN BOOLEAN  FALSE,
   policy_type              IN BINARY_INTEGER NULL,
   long_predicate           IN BOOLEAN  FALSE,
   sec_relevant_cols        IN VARCHAR2,
   sec_relevant_cols_opt    IN BINARY_INTEGER NULL);
```

Parameters

Table 89–3 ADD_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_ schema is specified, the current log-on user schema is assumed.
object_name	Name of table, view, or synonym to which the policy is added.
policy_name	Name of policy to be added. It must be unique for the same table or view.
function_schema	Schema of the policy function (current default schema, if NULL).
policy_function	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	Optional argument for INSERT or UPDATE statement types. The default is FALSE. Setting update_check to TRUE causes the server to also check the policy against the value after insert or update.
enable	Indicates if the policy is enabled when it is added. The default is TRUE.

Table 89–3 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 89–4. Specifying any of these policy types overrides the value of static_policy.
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
sec_relevant_cols_opt	Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See "Usage Notes" on page 89-11 for restrictions and additional information about this option.

Table 89–4 DBMS_RLS.ADD_POLICY Policy Types

Policy Type	Description
STATIC	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.
SHARED_STATIC	Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
CONTEXT_SENSITIVE	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
SHARED_CONTEXT_SENSITIVE	Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
DYNAMIC	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function on each statement parsing or execution. Applies to only one object.

Usage Notes

- SYS is free of any security policy.
- If no object_schema is specified, the current log-on user schema is assumed.
- The policy functions which generate dynamic predicates are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table of view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```

- The policy functions must have the purity level of WNDS (write no database state).

  See Also: The *Oracle Database Application Developer's Guide - Fundamentals* has more details about the RESTRICT_REFERENCES pragma.

- Dynamic predicates generated out of different policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with sec_relevant_cols_opt => dbms_rls.ALL_ROWS) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as NULL. The restrictions for this option are as follows:
  - Only applies to SELECT statements
  - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
  - If your application performs calculations, or does not expect NULL values, then you should use the default behavior of column-level VPD, which is specified with the sec_relevant_cols parameter.
  - If you use UPDATE AS SELECT with this option, then only the values in the columns you are allowed to see will be updated.
  - This option may prevent some rows from displaying. For example:

    ```
    select * from employees
    where salary = 10
    ```

    This query may not return rows if the salary column returns a NULL value because the column masking option has been set.

Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
dbms_rls.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hr_policy',
function_schema =>'hr',
policy_function => 'hrfun',
statement_types =>'select,index',
policy_type => dbms_rls.CONTEXT_SENSITIVE,
sec_relevant_cols=>'salary,birthdate,ssn');
END;
/
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
dbms_rls.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hosting_policy',
function_schema =>'hr',
policy_function => 'subfun',
policy_type => dbms_rls.SHARED_STATIC);
END;
/
```

ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   namespace       VARCHAR2,
   attribute       VARCHAR2);
```

Parameters

Table 89–5 ADD_POLICY_CONTEXT Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym to which the policy is added.
`namespace`	The namespace of the driving context
`attribute`	The attribute of the driving context.

Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- If no object_schema is specified, the current log-on user schema is assumed.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is `NULL`, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the `SYS_DEFAULT` policy group.
- To add a policy to table `hr.employees` in group `access_control_group`, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_
group','policy1','SYS', 'HR.ACCESS');
```

CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   policy_group    VARCHAR2);
```

Parameters

Table 89–6 CREATE_POLICY_GROUP Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym.
`object_name`	Name of the table, view, or synonym to which the policy is added.
`policy_group`	Name of the policy group that the policy belongs to.

Usage Notes

The group must be unique for each table or view.

DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (
  object_schema   VARCHAR2,
  object_name     VARCHAR2,
  policy_group    VARCHAR2);
```

Parameters

Table 89–7 DELETE_POLICY_GROUP Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   group_name      VARCHAR2,
   policy_name     VARCHAR2);
```

Parameters

Table 89–8 ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy to be enabled or disabled.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE_GROUPED_POLICY procedure is executed with "enable" set to FALSE.

DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   policy_group    VARCHAR2,
   policy_name     VARCHAR2);
```

Parameters

Table 89–9 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym to which the policy is dropped.
`policy_group`	The name of the policy group that the policy belongs to.
`policy_name`	The name of the policy.

DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 89-5

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.DROP_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_name     IN VARCHAR2);
```

Parameters

Table 89–10 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view or synonym (current default schema if `NULL`)..
`object_name`	Name of the table, view, or synonym for which the policy is dropped.
`policy_name`	Name of policy to be dropped from table, view, or synonym.

DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   namespace       VARCHAR2,
   attribute       VARCHAR2);
```

Parameters

Table 89–11 DROP_POLICY_CONTEXT Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym to which the policy is dropped.
`namespace`	The namespace of the driving context.
`attribute`	The attribute of the driving context.

ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   group_name      VARCHAR2,
   policy_name     VARCHAR2,
   enable          BOOLEAN);
```

Parameters

Table 89–12 ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy to be enabled or disabled.
`enable`	`TRUE` enables the policy; `FALSE` disables the policy.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 89-5

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ENABLE_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2,
   policy_name   IN VARCHAR2,
   enable        IN BOOLEAN);
```

Parameters

Table 89–13 ENABLE_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing table, view, or synonym (current default schema if `NULL`).
`object_name`	Name of table, view, or synonym with which the policy is associated.
`policy_name`	Name of policy to be enabled or disabled.
`enable`	`TRUE` to enable the policy, `FALSE` to disable the policy.

REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (
   object_schema   VARCHAR2,
   object_name     VARCHAR2,
   group_name      VARCHAR2,
   policy_name     VARCHAR2);
```

Parameters

Table 89–14 REFRESH_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy.

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.

REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 89-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2 NULL,
   policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 89–15 REFRESH_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym.
`object_name`	Name of table, view, or synonym with which the policy is associated.
`policy_name`	Name of policy to be refreshed.

Usage Notes

The procedure returns an error if it tries to refresh a disabled policy.

90

DBMS_ROWID

The DBMS_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

> **Note:** DBMS_ROWID is not to be used with universal ROWIDs (UROWIDs).

This chapter contains the following topics:

Using DBMS_ROWID

Security Model

This package runs with the privileges of calling user, rather than the package owner `SYS`.

Types

Extension and Restriction Types

The types are as follows:

- RESTRICTED—restricted ROWID
- EXTENDED—extended ROWID

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

Note: Extended ROWIDs are only used in Oracle database version 8.X*i* and higher.

Verification Types

Table 90–1 Verification Types

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

Object Types

Table 90–2 Object Types

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

Conversion Types

Table 90–3 Conversion Types

Result	Description
INTERNAL	Convert to/from column of ROWID type

Table 90–3 (Cont.) Conversion Types

Result	Description
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```

Exceptions

Table 90–4 Exceptions

Exception	Description
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;
   pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
   pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

Operational Notes

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SLQ ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

  Note: ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
   FROM emp
   WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
  object_no   INTEGER;
  row_id      ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
    WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

Summary of DBMS_ROWID Subprograms

Table 90–5 DBMS_ROWID Package Subprograms

Subprogram	Description
ROWID_BLOCK_NUMBER Function on page 90-10	Returns the block number of a `ROWID`
ROWID_CREATE Function on page 90-11	Creates a `ROWID`, for testing only
ROWID_INFO Procedure on page 90-12	Returns the type and components of a `ROWID`
ROWID_OBJECT Function on page 90-13	Returns the object number of the extended `ROWID`
ROWID_RELATIVE_FNO Function on page 90-14	Returns the file number of a `ROWID`
ROWID_ROW_NUMBER Function on page 90-15	Returns the row number
ROWID_TO_ABSOLUTE_FNO Function on page 90-16	Returns the absolute file number associated with the `ROWID` for a row in a specific table
ROWID_TO_EXTENDED Function on page 90-17	Converts a `ROWID` from restricted format to extended
ROWID_TO_RESTRICTED Function on page 90-19	Converts an extended `ROWID` to restricted format
ROWID_TYPE Function on page 90-20	Returns the `ROWID` type: 0 is restricted, 1 is extended
ROWID_VERIFY Function on page 90-21	Checks if a `ROWID` can be correctly extended by the `ROWID_TO_EXTENDED` function

ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input `ROWID`.

Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (
   row_id      IN   ROWID,
   ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–6 ROWID_BLOCK_NUMBER Function Parameters

Parameter	Description
`row_id`	`ROWID` to be interpreted.
`ts_type_in`	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example SQL statement selects the block number from a `ROWID` and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
   FROM some_table
   WHERE key_value = 42);
```

ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (
   rowid_type    IN NUMBER,
   object_number IN NUMBER,
   relative_fno  IN NUMBER,
   block_number  IN NUMBER,
   row_number    IN NUMBER)
  RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–7 ROWID_CREATE Function Parameters

Parameter	Description
rowid_type	Type (restricted or extended). Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted).
relative_fno	Relative file number.
block_number	Block number in this file.
row_number	Returns row number in this block.

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID. This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
   rowid_in         IN   ROWID,
   ts_type_in       IN   VARCHAR2 DEFAULT 'SMALLFILE',
   rowid_type       OUT  NUMBER,
   object_number    OUT  NUMBER,
   relative_fno     OUT  NUMBER,
   block_number     OUT  NUMBER,
   row_number       OUT  NUMBER);
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–8 ROWID_INFO Procedure Parameters

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.
rowid_type	Returns type (restricted/extended).
object_number	Returns data object number (rowid_object_undefined for restricted).
relative_fno	Returns relative file number.
block_number	Returns block number in this file.
row_number	Returns row number in this block.

See Also: "ROWID_TYPE Function" on page 90-20

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```
DBMS_ROWID.ROWID_INFO(my_rowid, 'BIGFILE', rid_type, obj_num, file_num, block_num,
row_num);

DBMS_OUTPUT.PUT_LINE('The type is ' || rid_type);
DBMS_OUTPUT.PUT_LINE('Data object number is ' || obj_num);
-- and so on...
```

ROWID_OBJECT Function

This function returns the data object number for an extended ROWID. The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–9 ROWID_OBJECT Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Note: The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object(ROWID)
   FROM emp
   WHERE empno = 7499;
```

ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
   rowid_id      IN   ROWID,
   ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–10 ROWID_RELATIVE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
   file_number    INTEGER;
   rowid_val      ROWID;
BEGIN
   SELECT ROWID INTO rowid_val
     FROM dept
     WHERE loc = 'Boston';
   file_number :=
     dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

ROWID_ROW_NUMBER Function

This function extracts the row number from the `ROWID IN` parameter.

Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (
   row_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–11 ROWID_ROW_NUMBER Function Parameters

Parameter	Description
`row_id`	`ROWID` to be interpreted.

Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)
   FROM emp
   WHERE ename = 'ALLEN';
```

ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table. The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (
   row_id      IN ROWID,
   schema_name IN VARCHAR2,
   object_name IN VARCHAR2)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

Table 90–12 ROWID_TO_ABSOLUTE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
schema_name	Name of the schema which contains the table.
object_name	Table name.

Examples

```
DECLARE
   abs_fno        INTEGER;
   rowid_val      CHAR(18);
   object_name    VARCHAR2(20) := 'EMP';
BEGIN
    SELECT ROWID INTO rowid_val
     FROM emp
     WHERE empno = 9999;
     abs_fno := dbms_rowid.rowid_to_absolute_fno(
     rowid_val, 'SCOTT', object_name);
```

Note: For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format. Later, it may be removed from this package into a different place.

Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (
   old_rowid       IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

Table 90–13 ROWID_TO_EXTENDED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
schema_name	Name of the schema which contains the table (optional).
object_name	Table name (optional).
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
   SET rowid_col =
   dbms_rowid.rowid_to_extended (
      rowid_col, 'SCOTT", TABLE_COL, 0);
```

Usage Notes

If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the

converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.

If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.

If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID_ROWID exception is raised. If they do match, the input ROWID is returned.

> **See Also:** The ROWID_VERIFY Function has a method to determine if a given ROWID can be converted to the extended format.

ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
   old_rowid       IN ROWID,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–14 ROWID_TO_RESTRICTED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 90–15 ROWID_TYPE Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
   my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

ROWID_VERIFY Function

This function verifies the ROWID. It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

> **Note:** You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (
   rowid_in        IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 90–16 ROWID_VERIFY Function Parameters

Parameter	Description
rowid_in	ROWID to be verified.
schema_name	Name of the schema which contains the table.
object_name	Table name.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Examples

Considering the schema in the example for the ROWID_TO_EXTENDED function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
   FROM SCOTT.RIDS
   WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

DBMS_RULE

The DBMS_RULE package contains subprograms that enable the evaluation of a rule set for a specified event.

See Also:

- Chapter 196, "Rule TYPEs" for more information about the types used with the DBMS_RULE package
- Chapter 92, "DBMS_RULE_ADM" and *Oracle Streams Concepts and Administration* for more information about this package and rules

This chapter contains the following topics:

Using DBMS_RULE

This section contains topics which relate to using the `DBMS_RULE` package.

Security Model

PUBLIC is granted EXECUTE privilege on this package.

Summary of DBMS_RULE Subprograms

Table 91–1 DBMS_RULE Package Subprograms

Subprogram	Description
CLOSE_ITERATOR Procedure on page 91-5	Closes an open iterator
EVALUATE Procedures on page 91-6	Evaluates the rules in the specified rule set that use the evaluation context specified
GET_NEXT_HIT Function on page 91-10	Returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator; returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

```
DBMS_RULE.CLOSE_ITERATOR(
  iterator  IN  NUMBER);
```

Parameter

Table 91–2 CLOSE_ITERATOR Procedure Parameter

Parameter	Description
iterator	The iterator to be closed

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

See Also: "EVALUATE Procedures" on page 91-6

EVALUATE Procedures

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```
DBMS_RULE.EVALUATE(
  rule_set_name         IN   VARCHAR2,
  evaluation_context    IN   VARCHAR2,
  event_context         IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values          IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values         IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values       IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values      IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit     IN   BOOLEAN                      DEFAULT FALSE,
  simple_rules_only     IN   BOOLEAN                      DEFAULT FALSE,
  true_rules            OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules           OUT  SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE(
  rule_set_name          IN   VARCHAR2,
  evaluation_context     IN   VARCHAR2,
  event_context          IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values           IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values          IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values        IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values       IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  simple_rules_only      IN   BOOLEAN                      DEFAULT FALSE,
  true_rules_iterator    OUT  BINARY_INTEGER,
  maybe_rules_iterator   OUT  BINARY_INTEGER);
```

Parameters

Table 91–3 EVALUATE Procedure Parameters

Parameter	Description
`rule_set_name`	Name of the rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to evaluate all of the rules in a rule set named `hr_rules` in the `hr` schema, enter `hr.hr_rules` for this parameter. If the schema is not specified, then the schema of the current user is used.
`evaluation_context`	An evaluation context name in the form `[`*`schema_name`*`.]`*`evaluation_context_name`*. If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
`event_context`	A list of name-value pairs that identify events that cause evaluation

Table 91–3 (Cont.) EVALUATE Procedure Parameters

Parameter	Description
table_values	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
column_values	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in table_values.
variable_values	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
attribute_values	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in variable_values.
stop_on_first_hit	If TRUE, then the rules engine stops evaluation as soon as it finds a TRUE rule. If TRUE and there are no TRUE rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to TRUE given more data. If FALSE, then the rules engine continues to evaluate rules even after it finds a TRUE rule.
simple_rules_only	If TRUE, then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If FALSE, then evaluates all rules.
true_rules	Receives the output of the EVALUATE procedure into a varray of RE$RULE_HIT_LIST type. If no rules evaluate to TRUE, then true_rules is empty. If at least one rule evaluates to TRUE and stop_on_first_hit is TRUE, then true_rules contains one rule that evaluates to TRUE. If stop_on_first_hit is FALSE, then true_rules contains all rules that evaluate to TRUE.
maybe_rules	If all rules can be evaluated completely, without requiring any additional data, then maybe_rules is empty. If stop_on_first_hit is TRUE, then if there is at least one rule that may evaluate to TRUE given more data, and no rules evaluate to TRUE, then maybe_rules contains one rule that may evaluate to TRUE. If stop_on_first_hit is FALSE, then maybe_rules contains all rules that may evaluate to TRUE given more data.
true_rules_iterator	Contains the iterator for accessing rules that are TRUE
maybe_rules_iterator	Contains the iterator for accessing rules that may be TRUE given additional data or the ability to issue SQL

Usage Notes

> **Note:** Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of `1` for attribute `"a.b"` of variable `"x"`, a rule with the following rule condition can be returned as `TRUE`, without a value for table `"tab"`:

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute `"x.a.b"` is specified, but no value is specified for the variable `"x"`, the attribute `"a"`, or the attribute `"a.b"`.
  - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

  Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free

resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

Note: The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

- Chapter 196, "Rule TYPEs" for more information about the types used with the `DBMS_RULE` package
- "GET_NEXT_HIT Function" on page 91-10
- "CLOSE_ITERATOR Procedure" on page 91-5

GET_NEXT_HIT Function

This function returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator. The function returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(
  iterator  IN  NUMBER)
RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 91–4 GET_NEXT_HIT Function Parameter

Parameter	Description
iterator	The iterator from which the rule that evaluated to TRUE or MAYBE is retrieved

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns NULL, it is closed automatically. If an open iterator is no longer needed, then use the CLOSE_ITERATOR procedure in the DBMS_RULE package to close it.

Note: This function raises an error if the rule set being evaluated was modified after the call to the DBMS_RULE.EVALUATE procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

DBMS_RULE_ADM

The DBMS_RULE_ADM package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

See Also:

- Chapter 196, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package
- Chapter 91, "DBMS_RULE" and *Oracle Streams Concepts and Administration* for more information about this package and rules

This chapter contains the following topics:

Using DBMS_RULE_ADM

This section contains topics which relate to using the `DBMS_RULE_ADM` package.

Security Model

User group PUBLIC is granted EXECUTE privilege on this package.

See Also: *Oracle Database Security Guide* for more information about user group PUBLIC

Summary of DBMS_RULE_ADM Subprograms

Table 92–1 DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ADD_RULE Procedure on page 92-5	Adds the specified rule to the specified rule set
ALTER_EVALUATION_CONTEXT Procedure on page 92-7	Alters a rule evaluation context
ALTER_RULE Procedure on page 92-10	Changes one or more aspects of the specified rule
CREATE_EVALUATION_CONTEXT Procedure on page 92-12	Creates a rule evaluation context
CREATE_RULE Procedure on page 92-14	Creates a rule with the specified name
CREATE_RULE_SET Procedure on page 92-16	Creates a rule set with the specified name
DROP_EVALUATION_CONTEXT Procedure on page 92-17	Drops the rule evaluation context with the specified name
DROP_RULE Procedure on page 92-18	Drops the rule with the specified name
DROP_RULE_SET Procedure on page 92-19	Drops the rule set with the specified name
GRANT_OBJECT_PRIVILEGE Procedure on page 92-20	Grants the specified object privilege on the specified object to the specified user or role
GRANT_SYSTEM_PRIVILEGE Procedure on page 92-22	Grants the specified system privilege to the specified user or role
REMOVE_RULE Procedure on page 92-24	Removes the specified rule from the specified rule set
REVOKE_OBJECT_PRIVILEGE Procedure on page 92-26	Revokes the specified object privilege on the specified object from the specified user or role
REVOKE_SYSTEM_PRIVILEGE Procedure on page 92-27	Revokes the specified system privilege from the specified user or role

Note: All subprograms commit unless specified otherwise.

ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
   rule_name           IN  VARCHAR2,
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2   DEFAULT NULL,
   rule_comment        IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 92–2 ADD_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are adding to the rule set, specified as [*schema_name.*]*rule_name*. For example, to add a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set to which you are adding the rule, specified as [*schema_name.*]*rule_set_name*. For example, to add the rule to a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
rule_comment	Optional description, which can contain the reason for adding the rule to the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_RULE privilege on the rule
- Have EXECUTE_ANY_RULE system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  remove_table_aliases         IN  BOOLEAN                    DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types        IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                    DEFAULT FALSE);
```

Parameters

Table 92–3 ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are altering, specified as [*schema_name.*]*evaluation_context_name*. For example, to alter an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	If NULL and remove_table_aliases is FALSE, then the procedure retains the existing table aliases. If NULL and remove_table_aliases is TRUE, then the procedure removes the existing table aliases. If non-NULL, then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
remove_table_aliases	If TRUE and table_aliases is NULL, then the procedure removes the existing table aliases for the evaluation context. If TRUE and table_aliases is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove table aliases.
variable_types	If NULL and remove_variable_types is FALSE, then the procedure retains the variable types. If NULL and remove_variable_types is TRUE, then the procedure removes the existing variable types. If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.

Table 92–3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
remove_variable_types	If TRUE and variable_types is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and variable_types is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the variable types.
evaluation_function	If NULL and remove_evaluation_function is FALSE, then the procedure retains the existing evaluation function. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation function. If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function. An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See "CREATE_EVALUATION_CONTEXT Procedure" on page 92-12for more information about evaluation functions.
remove_evaluation_function	If TRUE and evaluation_function is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and evaluation_function is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation function.
evaluation_context_comment	If NULL and remove_eval_context_comment is FALSE, then the procedure retains the existing evaluation context comment. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation context comment. If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment. An evaluation context comment is an optional description of the rule evaluation context.
remove_eval_context_comment	If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user

- Have `ALTER_ANY_EVALUATION_CONTEXT` system privilege

See Also: Chapter 196, "Rule TYPEs" for more information about the types used with the `DBMS_RULE_ADM` package

ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
   rule_name                  IN  VARCHAR2,
   condition                  IN  VARCHAR2        DEFAULT NULL,
   evaluation_context         IN  VARCHAR2        DEFAULT NULL,
   remove_evaluation_context  IN  BOOLEAN         DEFAULT FALSE,
   action_context             IN  SYS.RE$NV_LIST  DEFAULT NULL,
   remove_action_context      IN  BOOLEAN         DEFAULT FALSE,
   rule_comment               IN  VARCHAR2        DEFAULT NULL,
   remove_rule_comment        IN  BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 92–4 ALTER_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are altering, specified as [*schema_name.*]*rule_name*. For example, to alter a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
remove_evaluation_context	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the evaluation_context parameter is non-NULL, then this parameter should be set to FALSE.
action_context	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
remove_action_context	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the action_context parameter is non-NULL, then this parameter should be set to FALSE.
rule_comment	If non-NULL, then the existing comment of the rule is replaced by the specified comment.

Table 92–4 (Cont.) ALTER_RULE Procedure Parameters

Parameter	Description
remove_rule_comment	If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the rule_comment parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule
- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:** Chapter 196, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package

CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL);
```

Parameters

Table 92–5 CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as [*schema_name.*]*evaluation_context_name*. For example, to create an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context
evaluation_function	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See "Usage Notes" for more information about the evaluation function.
evaluation_context_comment	An optional description of the rule evaluation context.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have CREATE_EVALUATION_CONTEXT_OBJ system privilege
- Have CREATE_ANY_EVALUATION_CONTEXT system privilege

> **See Also:** Chapter 196, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name       IN   VARCHAR2,
```

```
  evaluation_context  IN   VARCHAR2,
  event_context       IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values        IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values       IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values     IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values    IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit   IN   BOOLEAN                      DEFAULT FALSE,
  simple_rules_only   IN   BOOLEAN                      DEFAULT FALSE,
  true_rules          OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules         OUT  SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

Note: Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.
- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
   rule_name           IN  VARCHAR2,
   condition           IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2        DEFAULT NULL,
   action_context      IN  SYS.RE$NV_LIST  DEFAULT NULL,
   rule_comment        IN  VARCHAR2        DEFAULT NULL);
```

Parameters

Table 92–6 CREATE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are creating, specified as [*schema_name.*]*rule_name*. For example, to create a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition: department_id = 30 **Note:** Do not include the word "WHERE" in the condition.
evaluation_context	An optional evaluation context name in the form [*schema_name.*]*evaluation_context_name*, which is associated with the rule. If the schema is not specified, then the current user is the default. If evaluation_context is not specified, then the rule inherits the evaluation context from its rule set.
action_context	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
rule_comment	An optional description of the rule

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the CREATE_RULE_OBJ system privilege
- Have CREATE_ANY_RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:** Chapter 196, "Rule TYPEs" for more information about the types used with the `DBMS_RULE_ADM` package

CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2  DEFAULT NULL,
   rule_set_comment    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 92–7 CREATE_RULE_SET Procedure Parameters

Parameter	Description
`rule_set_name`	The name of the rule set you are creating, specified as `[`*`schema_name.`*`]`*`rule_set_name`*. For example, to create a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default.
`evaluation_context`	An optional evaluation context name in the form `[`*`schema_name.`*`]`*`evaluation_context_name`*, which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
`rule_set_comment`	An optional description of the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT(
   evaluation_context_name  IN  VARCHAR2,
   force                    IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 92–8 DROP_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
`evaluation_context_name`	The name of the evaluation context you are dropping, specified as `[`*`schema_name`*`.]`*`evaluation_context_name`*.
	For example, to drop an evaluation context named `dept_eval_context` in the `hr` schema, enter `hr.dept_eval_context` for this parameter. If the schema is not specified, then the current user is the default.
`force`	If `TRUE`, then the procedure removes the rule evaluation context from all rules and rule sets that use it.
	If `FALSE` and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context.
	If `FALSE` and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception.
	Caution: Setting `force` to `TRUE` can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the `ADD_RULE` procedure, then the rule cannot be evaluated.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have `DROP_ANY_EVALUATION_CONTEXT` system privilege

DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE(
   rule_name  IN  VARCHAR2,
   force      IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 92–9 DROP_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are dropping, specified as [*schema_name.*]*rule_name*. For example, to drop a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
force	If TRUE, then the procedure removes the rule from all rule sets that contain it. If FALSE and no rule sets contain the rule, then the procedure drops the rule. If FALSE and one or more rule sets contain the rule, then the procedure raises an exception.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP_ANY_RULE system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the REMOVE_RULE procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
   rule_set_name  IN  VARCHAR2,
   delete_rules   IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 92–10 DROP_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as [*schema_name.*]*rule_set_name*. For example, to drop a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
delete_rules	If TRUE, then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE, then the procedure does not drop the rules in the rule set.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have DROP_ANY_RULE_SET system privilege
- Be the owner of the rule set

> **Note:** The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   object_name   IN  VARCHAR2,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 92–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege to grant to the grantee on the object. See "Usage Notes" on page 92-20 for the available object privileges.
`object_name`	The name of the object for which you are granting the privilege to the grantee, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, to grant the privilege on a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
`grantee`	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
`grant_option`	If `TRUE`, then the specified user or users granted the specified privilege can grant this privilege to others. If `FALSE`, then the specified user or users granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have `EXECUTE` privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 92–12 lists the object privileges.

Table 92–12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT	Alter and execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE	Alter and execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET	Alter and execute a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT	Alter a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE	Alter a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET	Alter a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT	Execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE	Execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET	Execute a particular rule set in another user's schema

Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name  => 'strmadmin.hr_dml',
    grantee      => 'hr',
    grant_option => FALSE);
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 92–13 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The name of the system privilege to grant to the grantee.
grantee	The name of the user or role for which the privilege is granted
grant_option	If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

Table 92–14 lists the system privileges.

Table 92–14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT	Alter any evaluation context owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE	Alter any rule owned by any user
SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET	Alter any rule set owned by any user
SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT	Create a new evaluation context in any schema
SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ	Create a new evaluation context in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE	Create a new rule in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ	Create a new rule in the grantee's schema
SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET	Create a new rule set in any schema
SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ	Create a new rule set in the grantee's schema
SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT	Drop any evaluation context in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE	Drop any rule in any schema
SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET	Drop any rule set in any schema

Table 92–14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the strmadmin user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee      => 'strmadmin',
    grant_option => FALSE);
END;
/
```

Note: When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS.

REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
   rule_name                IN  VARCHAR2,
   rule_set_name            IN  VARCHAR2,
   evaluation_context       IN  VARCHAR2  DEFAULT NULL,
   all_evaluation_contexts  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 92–15 REMOVE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are removing from the rule set, specified as [*schema_name.*]*rule_name*. For example, to remove a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set from which you are removing the rule, specified as [*schema_name.*]*rule_set_name*. For example, to remove the rule from a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context_name	The name of the evaluation context associated with the rule you are removing, specified as [*schema_name.*]*evaluation_context_name*. For example, to specify an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default. If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the ADD_RULE procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error. Specify NULL if you did not specify an evaluation context when you added the rule to the rule set. If you specify NULL and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.
all_evaluation_contexts	If TRUE, then the procedure removes the rule from the rule set with all of its associated evaluation contexts. If FALSE, then the procedure only removes the rule with the specified evaluation context. This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Note: This procedure does not drop a rule from the database. To drop a rule from the database, use the DROP_RULE procedure.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(
   privilege    IN  BINARY_INTEGER,
   object_name  IN  VARCHAR2,
   revokee      IN  VARCHAR2);
```

Parameters

Table 92–16 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege on the object to revoke from the revokee. See "GRANT_OBJECT_PRIVILEGE Procedure" on page 92-20 for a list of the object privileges.
`object_name`	The name of the object for which you are revoking the privilege from the revokee, specified as `[`*`schema_name.`*`]`*`object_name`*. For example, to revoke an object privilege on a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(
   privilege  IN  BINARY_INTEGER,
   revokee    IN  VARCHAR2);
```

Parameters

Table 92–17 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the system privilege to revoke from the revokee. See "GRANT_SYSTEM_PRIVILEGE Procedure" on page 92-22 for a list of the system privileges.
`revokee`	The name of the user or role from which the privilege is revoked

93

DBMS_SCHEDULER

The DBMS_SCHEDULER package provides a collection of scheduling functions and procedures that are callable from any PL/SQL program.

> **See Also:** *Oracle Database Administrator's Guide* for more information regarding how to use DBMS_SCHEDULER

This chapter contains the following topics:

Using DBMS_SCHEDULER

This section contains topics which relate to using the `DBMS_SCHEDULER` package.

Rules and Limits

The following rules apply when using the DBMS_SCHEDULER package:

- Only SYS can do anything in SYS schema.
- Several of the procedures accept comma-delimited lists of object names. When a list of names is provided, the Scheduler will stop executing the list on the very first object that returns an error. This means that the Scheduler will not perform the task on the objects in the list after the one that caused the error. For example, consider the statement DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3'); If job3 could not be stopped, then job1 and job2 will be stopped, but the jobs in jobclass1, jobclass2, and jobclass3 will not be stopped.
- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

Operational Notes

The Scheduler uses a rich **calendaring syntax** to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

The calendaring syntax is as follows:

```
repeat_interval = regular_schedule | combined_schedule

regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause][";" periods_clause]
[";" byperiod_clause]

combined_schedule = schedule_list [";" include_clause]
[";" exclude_clause] [";" intersect_clause]

frequency_clause = "FREQ" "=" ( predefined_frequency | user_defined_frequency )
predefined_frequency = "YEARLY" | "MONTHLY" | "WEEKLY" | "DAILY" |
   "HOURLY" | "MINUTELY" | "SECONDLY"
user_defined_frequency = named_schedule

interval_clause = "INTERVAL" "=" intervalnum
   intervalnum = 1 through 99
bymonth_clause = "BYMONTH" "=" monthlist
   monthlist = monthday ( "," monthday)*
   month = numeric_month | char_month
   numeric_month = 1 | 2 | 3 ...  12
   char_month = "JAN" | "FEB" | "MAR" | "APR" | "MAY" | "JUN" |
   "JUL" | "AUG" | "SEP" | "OCT" | "NOV" | "DEC"
byweekno_clause = "BYWEEKNO" "=" weeknumber_list
   weeknumber_list = weeknumber ( "," weeknumber)*
   weeknumber = [minus] weekno
   weekno = 1 through 53
byyearday_clause = "BYYEARDAY" "=" yearday_list
   yearday_list = yearday ( "," yearday)*
   yearday = [minus] yeardaynum
   yeardaynum = 1 through 366
bydate_clause = "BYDATE" "=" date_list
   date_list = date ( "," date)*
   date = [YYYY]MMDD [ offset | span ]
bymonthday_clause = "BYMONTHDAY" "=" monthday_list
   monthday_list = monthday ( "," monthday)*
   monthday = [minus] monthdaynum
   monthdaynum = 1 through 31
byday_clause = "BYDAY" "=" byday_list
   byday_list = byday ( "," byday)*
   byday = [weekdaynum] day
   weekdaynum = [minus] daynum
   daynum = 1 through 53 /* if frequency is yearly */
```

```
   daynum = 1 through 5  /* if frequency is monthly */
   day = "MON" | "TUE" | "WED" | "THU" | "FRI" | "SAT" | "SUN"
byhour_clause = "BYHOUR" "=" hour_list
   hour_list = hour ( "," hour)*
   hour = 0 through 23
byminute_clause = "BYMINUTE" "=" minute_list
   minute_list = minute ( "," minute)*
   minute = 0 through 59
bysecond_clause = "BYSECOND" "=" second_list
   second_list = second ( "," second)*
   second = 0 through 59
bysetpos_clause = "BYSETPOS" "=" setpos_list
   setpos_list = setpos ("," setpos)*
   setpos = [minus] setpos_num
   setpos_num = 1 through 9999

include_clause = "INCLUDE" "=" schedule_list
exclude_clause = "EXCLUDE" "=" schedule_list
intersect_clause = "INTERSECT" "=" schedule_list
schedule_list = schedule_clause ("," schedule_clause)*
schedule_clause = named_schedule [ offset ]
named_schedule = [schema "."] schedule
periods_clause = "PERIODS" "=" periodnum
byperiod_clause = "BYPERIOD" "=" period_list
period_list = periodnum ("," periodnum)*
periodnum = 1 through 100

offset = ("+" | "-") ["OFFSET:"] duration_val
span = ("+" | "-" | "^") "SPAN:" duration_val
duration_val = dur-weeks | dur_days
dur_weeks = numofweeks "W"
dur_days = numofdays "D"
numofweeks = 1 through 53
numofdays = 1 through 376
minus = "-"
```

In calendaring syntax, * means 0 or more.

Table 93–1 Values for repeat_interval

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 999.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.

Table 93–1 (Cont.) Values for repeat_interval

Name	Description
BYWEEKNO	This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. That last definition is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th. The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year. As an example, in the year 1998 the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01; and January 1st, 1999, is in the ISO week 1998-53. byweekno is only valid for YEARLY. Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY;BYWEEKNO=53;BYMONTH=1".
BYYEARDAY	This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.
BYDATE	This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause is the following: BYDATE=0115,0315,0615,0915,1215,20060115 The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10: BYDATE=0110+SPAN:5D The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of n days or weeks centered around the supplied date. If n is an even number, it is adjusted up to the next odd number. Offsets adjust the supplied date by adding or subtracting n days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.
BYMONTHDAY	This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.
BYDAY	This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.
BYHOUR	This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.
BYMINUTE	This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.

Table 93–1 (Cont.) Values for repeat_interval

Name	Description
BYSECOND	This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.
BYSETPOS	This selects one or more items by position in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be: `FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1` Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies. The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.
INCLUDE	This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.
EXCLUDE	This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure.

INTERSECT	This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.
	For example, assume that the named schedule last_sat indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule end_qtr indicates the last day of each quarter in 2005:
	`3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	The following calendaring expression results in the these dates:
	`3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	`FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr`
	In this example, the terms FREQ=MONTHLY; BYMONTHDAY=-1 indicate the last day of each month.

Table 93–1 (Cont.) Values for repeat_interval

Name	Description
PERIODS	This identifies the number of periods that together form one cycle of a user defined frequency. It is used in the repeat_interval expression of the schedule that defines the user defined frequency. It is mandatory when the repeat_interval expression in the main schedule contains a BYPERIOD clause. The following example defines the quarters of a fiscal year. FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
BYPERIOD	This selects periods from a user defined frequency. For example, if a main schedule names a user defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause BYPERIOD=2,4 in the main schedule selects the 2nd and 4th fiscal quarters.

Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules

  For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule. You can follow the initial list of individual schedules with include, exclude, and intersect clauses to create more complex combinations.

- Embedding other schedules into the main schedule using include, exclude, and intersect clauses

  With this method, the embedded schedules inherit certain attributes from the main schedule.

  – Timestamps generated by the INCLUDE clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the INTERVAL clause, the BYPERIOD clause, or the BYMONTH clause for freq=monthly.

  – Days that are added by the INCLUDE clause follow the hourly/minutely/secondly execution pattern of the main schedule.

  – When the INCLUDE clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See "Start Dates and Repeat Intervals", later in this section.) For example, a repeat_interval of FREQ=MONTHLY;INCLUDE=HOLIDAY executes only on holidays and not on the month/day defaults retrieved from the start date.

  The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

  In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the INTERVAL clause. If the start date of the main schedule is 1/1/2005, then 2/20 isn't added. On the dates that are added, the embedded schedule follows the

execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User Defined Frequencies

Instead of using predefined frequencies like DAILY, WEEKLY, MONTHLY, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following repeat_interval expression is used in a schedule named fiscal_year that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the fiscal_year schedule as a user defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user defined frequency do not have to be equal in length. In the main schedule, the BYSETPOS clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the BYPERIOD clause in the main schedule. To enable this, the schedule that is used as the user defined frequency must include a PERIODS clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the repeat_interval clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the repeat_interval. For example, if the specified frequency is yearly and there is no BYMONTH or BYMONTHDAY clause in the repeat interval, the month and day on which to run the job are retrieved from the start date. Similarly, if frequency is monthly but there is no BYMONTHDAY clause in the repeat interval, the day of the month on which to run the job is retrieved from the start date. If present, BYHOUR, BYMINUTE, and BYSECOND defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the INCLUDE, EXCLUDE, or INTERSECT clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are.

The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly

is expanded internally to:

freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a repeat_interval of FREQ=YEARLY;BYDATE=0701.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

```
is expanded internally to:

freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an INCLUDE clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semi-colon, and each clause can be present at most once, with the exception of the include, exclude, and intersect clauses.
- Spaces are allowed between syntax elements and the strings are case insensitive.
- The list of values for a specific BY clause do not need to be ordered.
- When not enough BY clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "FREQ=YEARLY" with a start date of 02/15/2003 becomes "FREQ=YEARLY;BYMONTH=FEB; BYMONTHDAY=15", which means every year on the 15th of February.

  "FREQ=YEARLY;BYMONTH=JAN,JUL" with start date 01/21/2003 becomes "FREQ=YEARLY;BYMONTH=JAN,JUL;BYMONTHDAY=21", which means every year on January 21 and July 21.
- The byweekno clause is only allowed if the frequency is YEARLY. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a BYDAY clause. For example, "FREQ=YEARLY;BYWEEKNO=2" with a start date of 01/01/2003 will return:

  ```
  01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
  01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
  ```

  Note that when the byweekno clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "FREQ=YEARLY;BYWEEKNO=1,53" for the specified week numbers in 2004, it will return the dates:

  ```
  12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
  12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
  ```

- For those BY clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying BYMONTHDAY=31 will not give you the last day of every month, because not every month has 31 days. Instead, BYMONTHDAY=-1 will give you the last day of the month.

  This is not supported for BY clauses that are fixed in size. In other words, BYMONTH, BYHOUR, BYMINUTE, and BYSECOND are not supported.
- The basic values for the BYDAY clause are the days of the week. When the frequency is YEARLY, or MONTHLY, you are allowed to specify a positive or negative number in front of each day of the week. In the case of YEARLY,

BYDAY=40MON, indicates the 40th Monday of the year. In the case of MONTHLY, BYDAY=-2SAT, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.
- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the start_date argument. If jobs must follow daylight savings adjustments you must make sure that you specify a region name for the time zone of the start_date. For example specifying the start_date time zone as 'US/Eastern' in New York will make sure that daylight saving adjustments are automatically applied. If instead the time zone of the start_date is set to an absolute offset, such as '-5:00', daylight savings adjustments are not followed and your job execution will be off by an hour half of the year.
- When start_date is NULL, the Scheduler will determine the time zone for the repeat interval as follows:

  1. It will check whether the session time zone is a region name. The session time zone can be set by either:
     - Issuing an ALTER SESSION statement, for example:

       ```
       SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
       ```

     - Setting the ORA_SDTZ environment variable.
  2. If the session time zone is an absolute offset instead of a region name, the Scheduler will use the value of the DEFAULT_TIMEZONE Scheduler attribute. For more information, see the SET_SCHEDULER_ATTRIBUTE Procedure.
  3. If the DEFAULT_TIMEZONE attribute is NULL, the Scheduler will use the time zone of systimestamp when the job or window is enabled.

BYSETPOS Clause Rules

- The BYSETPOS clause is the last clause to be evaluated. It is processed after all other BY clauses and the INCLUDE, EXCLUDE and INTERSECT clauses have been evaluated.
- The INTERVAL clause does not change the size of the period to which the BYSETPOS clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which BYSETPOS is applied is generated from a month, not a quarter. The only impact of the INTERVAL clause is

to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which `BYSETPOS` is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

  ```
  FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
  ```

  on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules

- If dates in the `BYDATE` clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the `BY` clauses in the calendaring expression. For example, if `repeat_interval` is defined as

  ```
  freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
  ```

  then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules

- Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, `jan_fifteen` is a named schedule that resolves to the single date of 01/15:

  ```
  freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
       exclude=jan_fifteenth
  ```

  In this case, all three instances of the job are removed for 01/15.

OFFSET Rules

- You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute `JOB2` exactly 15 days after every occurrence of `JOB1`, add `+OFFSET:15D` to the schedule of `JOB1`, as follows:

  ```
  BEGIN
  dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
    'job1_schedule+OFFSET:15D');
  END;
  /
  ```

  Note that negative offsets to named schedules are not supported.

Example: Putting It All Together

This example demonstrates the use of user defined frequencies, spans, offsets, and the `BYSETPOS` and `INCLUDE` clauses. (Note that the `OFFSET:` keyword in an offset clause is optional.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
 dbms_scheduler.create_schedule('year_start', repeat_interval=>
       'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
 dbms_scheduler.create_schedule('retail_fiscal_year',
        to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
         'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
 dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
  'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
    BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

Summary of DBMS_SCHEDULER Subprograms

Table 93–2 DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ADD_EVENT_QUEUE_SUBSCRIBER Procedure on page 93-17	Adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`
ADD_WINDOW_GROUP_MEMBER Procedure on page 93-18	Adds a window to an existing window group
ALTER_CHAIN Procedure on page 93-19	Alters specified steps of a chain
ALTER_RUNNING_CHAIN Procedure on page 93-20	Alters specified steps of a running chain
CLOSE_WINDOW Procedure on page 93-22	Closes an open window prematurely
COPY_JOB Procedure on page 93-23	Copies an existing job
CREATE_CHAIN Procedure on page 93-24	Creates a chain, which is a named series of programs that are linked together for a combined objective
CREATE_EVENT_SCHEDULE Procedure on page 93-25	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
CREATE_JOB Procedures on page 93-27	Creates a job
CREATE_JOB_CLASS Procedure on page 93-32	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
CREATE_PROGRAM Procedure on page 93-34	Creates a program
CREATE_SCHEDULE Procedure on page 93-36	Creates a schedule
CREATE_WINDOW Procedures on page 93-37	Creates a window, which provides a way to automatically activate different resource plans at different times
CREATE_WINDOW_GROUP Procedure on page 93-39	Creates a window group
DEFINE_ANYDATA_ARGUMENT Procedure on page 93-40	Defines a program argument whose value is of a complex type and must be passed encapsulated in an `AnyData` object
DEFINE_CHAIN_EVENT_STEP Procedure on page 93-41	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: `DEFINE_CHAIN_STEP`.
DEFINE_CHAIN_RULE Procedure on page 93-42	Adds a rule to an existing chain
DEFINE_CHAIN_STEP Procedure on page 93-45	Defines a chain step, which can be a program or another (nested) chain. See also: `DEFINE_CHAIN_EVENT_STEP`.

Table 93–2 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
DEFINE_METADATA_ ARGUMENT Procedure on page 93-46	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument
DEFINE_PROGRAM_ ARGUMENT Procedures on page 93-48	Defines a program argument whose value can be passed as a string literal to the program
DISABLE Procedure on page 93-50	Disables a program, job, chain, window, or window group
DROP_CHAIN Procedure on page 93-52	Drops an existing chain
DROP_CHAIN_RULE Procedure on page 93-53	Removes a rule from an existing chain
DROP_CHAIN_STEP Procedure on page 93-54	Drops a chain step
DROP_JOB Procedure on page 93-55	Drops a job or all jobs in a job class
DROP_JOB_CLASS Procedure on page 93-56	Drops a job class
DROP_PROGRAM Procedure on page 93-57	Drops a program
DROP_PROGRAM_ ARGUMENT Procedures on page 93-58	Drops a program argument
DROP_SCHEDULE Procedure on page 93-59	Drops a schedule
DROP_WINDOW Procedure on page 93-60	Drops a window
DROP_WINDOW_ GROUP Procedure on page 93-61	Drops a window group
ENABLE Procedure on page 93-62	Enables a program, job, chain, window, or window group
EVALUATE_ CALENDAR_STRING Procedure on page 93-63	Evaluates the calendar string and tells you what the next execution date of a job or window will be
EVALUATE_RUNNING_ CHAIN Procedure on page 93-65	Forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied
GENERATE_JOB_NAME Function on page 93-66	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named `sally1`, `sally2`, and so on
GET_ATTRIBUTE Procedure on page 93-67	Retrieves the value of an attribute of an object
GET_SCHEDULER_ ATTRIBUTE Procedure on page 93-68	Retrieves the value of a Scheduler attribute
OPEN_WINDOW Procedure on page 93-69	Opens a window prematurely. The window is opened immediately for the duration

Table 93–2 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
PURGE_LOG Procedure on page 93-70	Purges specific rows from the job and window logs
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure on page 93-71	Unsubscribes a user from the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`
REMOVE_WINDOW_GROUP_MEMBER Procedure on page 93-72	Removes a window from an existing window group. This fails if the specified window is not a member of the given group
RESET_JOB_ARGUMENT_VALUE Procedures on page 93-73	Resets the current value assigned to an argument defined with the associated program
RUN_CHAIN Procedures on page 93-74	Immediately runs a chain by creating a run-once job
RUN_JOB Procedure on page 93-76	Runs a job immediately
SET_ATTRIBUTE Procedure on page 93-78	Changes an attribute of a job, schedule, or other Scheduler object
SET_ATTRIBUTE_NULL Procedure on page 93-87	Changes an attribute of an object to `NULL`
SET_JOB_ANYDATA_VALUE Procedures on page 93-88	Sets the value of a job argument encapsulated in an `AnyData` object
SET_JOB_ARGUMENT_VALUE Procedures on page 93-89	Sets the value of a job argument
SET_SCHEDULER_ATTRIBUTE Procedure on page 93-90	Sets the value of a Scheduler attribute
STOP_JOB Procedure on page 93-92	Stops a currently running job or all jobs in a job class

ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
   subscriber_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 93–3 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user.

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

ADD_WINDOW_GROUP_MEMBER Procedure

This procedure adds one or more windows to an existing window group.

Syntax

```
DBMS_SCHEDULER.ADD_WINDOW_GROUP_MEMBER (
   group_name              IN VARCHAR2,
   window_list             IN VARCHAR2);
```

Parameters

Table 93–4 ADD_WINDOW_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the window group
window_list	The name of the window or windows

Usage Notes

If an already open window is added to a window group, the Scheduler will not pick up jobs that point to this window group until the next window in the window group opens.

Adding a window to a group requires the MANAGE SCHEDULER privilege.

Note that a window group cannot be a member of another window group.

ALTER_CHAIN Procedure

This procedure alters specified steps of a chain. This affects all future runs of the specified steps.

Syntax

```
DBMS_SCHEDULER.ALTER_CHAIN (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   value                   IN BOOLEAN);
```

Parameters

Table 93–5 ALTER_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step or a comma-separated list of steps to alter. This cannot be NULL.
attribute	The attribute of the steps to change. This must be one of: 'PAUSE', 'SKIP', or 'RESTART_ON_RECOVERY' ■ 'PAUSE'—If the PAUSE attribute is set TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain FALSE). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. ■ 'SKIP'—If the SKIP attribute is set TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED. ■ 'RESTART_ON_RECOVERY'—If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues.
value	The value to set for the attribute. This must be one of: TRUE, FALSE.

Usage Notes

Altering a chain requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

ALTER_RUNNING_CHAIN Procedure

This procedure alters specified steps of a running chain. This will affect only steps of this running instance of the chain.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
   job_name                IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   value                   IN [BOOLEAN|VARCHAR2]);
```

Parameters

Table 93–6 ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to NULL and attribute is PAUSE or SKIP, then all steps of the running chain will be altered.
attribute	The attribute of the steps to change. This must be one of: 'PAUSE', 'SKIP', 'RESTART_ON_RECOVERY', or 'STATE'. ■ 'PAUSE'—If the PAUSE attribute is set TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain false). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE will be set to TRUE for all steps of this running chain. ■ 'SKIP'—If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP will be set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step will immediately change to state PAUSED. ■ 'RESTART_ON_RECOVERY'—If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. ■ 'STATE'—This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED *error_code*' If the state is being changed to FAILED, an error code must be included (this must be a positive integer).
value	The value to set for the attribute. This must be one of: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED *error_code*'

Usage Notes

Altering a running chain requires alter privileges on the job which is running (either by being the owner, or by having `ALTER` privileges on the job or by having the `CREATE ANY JOB` system privilege).

CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler will switch the resource plan to the one that was in effect outside the window or in the case of overlapping windows to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
   window_name             IN VARCHAR2);
```

Parameters

Table 93–7 CLOSE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running will not stop when the window it is running in closes unless the attribute stop_on_window_close was set to TRUE for the job. However, the resources allocated to the job may change because the resource plan may change.

When a running job has a window group as its schedule, the job will not be stopped when its window is closed if another window that is also a member of the same window group then becomes active. This is the case even if the job has the attribute stop_on_window_close set to TRUE.

Closing a window requires the MANAGE SCHEDULER privilege.

COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (
   old_job                IN VARCHAR2,
   new_job                IN VARCHAR2);
```

Parameters

Table 93–8 COPY_JOB Procedure Parameters

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

Usage Notes

Copying a job requires privileges to create a job in the schema of the new job (the CREATE JOB system privilege if it is in the user's own schema, and the CREATE ANY JOB system privilege otherwise). If the old job is not in the user's own schema, then he needs to additionally have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, `myschema.myname`).

A chain is always created disabled and must be enabled with the ENABLE Procedure before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
   chain_name              IN VARCHAR2,
   rule_set_name           IN VARCHAR2 DEFAULT NULL,
   evaluation_interval     IN INTERVAL DAY TO SECOND DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 93–9 CREATE_CHAIN Procedure Parameters

Parameter	Description
`chain_name`	The name of the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, so there must not already be a table or other object with this name and schema.
`rule_set_name`	In the normal case, no rule set should be passed in. The Scheduler will automatically create a rule set and associated empty evaluation context. You then use `DEFINE_CHAIN_RULE` to add rules and `DROP_CHAIN_RULE` to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created will be of the form `SCHED_RULESET${N}` and the evaluation context created will be of the form `SCHED_EVCTX${N}` See *Oracle Streams Concepts and Administration* for information on rules and rule sets.
`evaluation_interval`	If this is `NULL`, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-`NULL` value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at `NULL` if possible. `evaluation_interval` cannot be less than a minute or greater than a day.
`comments`	An optional comment describing the purpose of the chain

Usage Notes

Creating a chain in one's own schema requires the `CREATE JOB` system privilege. Creating a chain in a different schema requires the `CREATE ANY JOB` system privilege. If no `rule_set_name` is given, a rule set and evaluation context will be created in the schema that the chain is being created in, so the user will need to have the privileges required to create these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
   schedule_name           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 93–10 CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
schedule_name	This.attribute specifies a unique identifier for the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the date on which this schedule becomes valid. Occurrences of the event before this date are ignored in the context of this schedule.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with tab.user_data. For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
queue_spec	This argument specifies the queue into which events that start this particular job will be enqueued (the **source queue**). If the source queue is a secure queue, the queue_spec argument is a string containing a pair of values of the form *queue_name*, *agent name*. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
end_date	The date after which jobs will not run and windows will not open. An event schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error will be generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in one's own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema.schedule_name. Once a schedule has been created, it

can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

CREATE_JOB Procedures

This procedure creates a job.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   job_type             IN VARCHAR2,
   job_action           IN VARCHAR2,
   number_of_arguments  IN PLS_INTEGER              DEFAULT 0,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name               IN VARCHAR2,
   program_name           IN VARCHAR2,
   schedule_name          IN VARCHAR2,
   job_class              IN VARCHAR2             DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                IN BOOLEAN              DEFAULT FALSE,
   auto_drop              IN BOOLEAN              DEFAULT TRUE,
   comments               IN VARCHAR2             DEFAULT NULL);
```

Creates a job using a named program object and an inlined schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   program_name         IN VARCHAR2,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL);
```

Creates a job using a named schedule object and an inlined program:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name               IN VARCHAR2,
   schedule_name          IN VARCHAR2,
   job_type               IN VARCHAR2,
   job_action             IN VARCHAR2,
   number_of_arguments    IN PLS_INTEGER       DEFAULT 0,
   job_class              IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                IN BOOLEAN           DEFAULT FALSE,
   auto_drop              IN BOOLEAN           DEFAULT TRUE,
   comments               IN VARCHAR2          DEFAULT NULL);
```

Creates a job using an inlined program and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   job_type                IN VARCHAR2,
   job_action              IN VARCHAR2,
   number_of_arguments     IN PLS_INTEGER       DEFAULT 0,
   start_date              IN TIMESTAMP WITH TIME ZONE,
   event_condition         IN VARCHAR2,
   event_queue             IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL);
```

Creates a job using a named program object and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   program_name            IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL);
```

Parameters

Table 93–11 CREATE_JOB Procedure Parameters

Parameter	Description
`job_name`	This attribute specifies the name of the job and uniquely identifies the job. The name has to be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name. If `job_name` is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the `GENERATE_JOB_NAME` procedure to generate a name and then use the output in the `CREATE_JOB` procedure. The `GENERATE_JOB_NAME` procedure call generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" on page 93-66 for more information.

Table 93–11 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_type	This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. The supported values are: ■ 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0. ■ 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. ■ 'EXECUTABLE' This specifies that the job is a job external to the database. External jobs are anything that can be executed from the operating system's command line. Anydata arguments are not supported with a job or program type of EXECUTABLE. The job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run. ■ 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so number_of_arguments must be 0.
job_action	This attribute specifies the action of the job. The following actions are possible: For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, my_proc(); or BEGIN my_proc(); END; or DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;. Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: DECLARE ... BEGIN job_action END; This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 93–22 on page 93-46 for details on available metadata attributes. For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. PL/SQL procedures with INOUT or OUT arguments are not supported as job_action when the job or program type is STORED_PROCEDURE. For an executable, the action is the name of the external executable, including the full path name and any command-line arguments. For a chain, the action is the name of a Scheduler chain object. You have to specify the schema of the chain if it resides in a different schema than the job. If job_action is not specified for an inline program, an error is generated when creating the job.

Table 93–11 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
number_of_arguments	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
program_name	The name of the program associated with this job. If the program is of type EXECUTABLE, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.
start_date	This attribute specifies the first date on which this job is scheduled to start. If start_date and repeat_interval are left null, then the job is scheduled to run as soon as the job is enabled. For repeating jobs that use a calendaring expression to specify the repeat interval, start_date is used as a reference date. The first time the job will be scheduled to run is the first match of the calendaring expression that is on or after the current date. The Scheduler cannot guarantee that a job will execute on an exact time because the system may be overloaded and thus resources unavailable.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with tab.user_data. For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
queue_spec	This argument specifies the queue into which events that start this particular job will be enqueued (the **source queue**). If the source queue is a secure queue, the queue_spec argument is a string containing a pair of values of the form *queue_name*, *agent name*. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
repeat_interval	This attribute specifies how often the job should repeat. You can specify the repeat interval by using calendaring or PL/SQL expressions. The expression specified is evaluated to determine the next time the job should run. If repeat_interval is not specified, the job will run only once at the specified start date. See "Calendaring Syntax" on page 93-4 for further information.
schedule_name	The name of the schedule, window, or window group associated with this job.
end_date	This attribute specifies the date after which the job will expire and will no longer be executed. When end_date is reached, the job is disabled. The STATE of the job will be set to COMPLETED, and the enabled flag will be set to FALSE. If no value for end_date is specified, the job will repeat forever unless max_runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If it is not, an error is generated when the job is enabled.
job_priority	This attribute designates the priority of a job relative to other jobs in the same job class only. If two jobs in the same class are scheduled to start at the same time, the one with the higher priority takes precedence. Acceptable values are 1 through 5, where 1 is the highest priority. Default value is 3.
comments	This attribute specifies a comment about the job. By default, this attribute is NULL.

Table 93–11 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
enabled	This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured and the job exists as a database object but the Scheduler will ignore it and the job coordinator will not pick the job for processing. In order for the job coordinator to process the job, the job has to be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.
auto_drop	This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been disabled. A job is considered completed if: ▪ Its end date (or its schedule's end date) has passed ▪ It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. ▪ It is not a repeating job and has run once A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE. If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE.

Usage Notes

Jobs are created disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

To create a job in your own schema, you need to have the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires EXECUTE privileges for that class or program.

Not all possible job attributes can be set with CREATE_JOB. Some must be set after the job is created. For example, job arguments must be set with the SET_JOB_ARGUMENT_VALUE Procedures or the SET_JOB_ANYDATA_VALUE Procedures. Other job attributes, such as job_priority and max_runs, are set with the SET_ATTRIBUTE Procedure.

Note: The Scheduler runs event-based jobs for each occurrence of an event that matches the job's event condition. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the SYS schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
   job_class_name            IN VARCHAR2,
   resource_consumer_group   IN VARCHAR2 DEFAULT NULL,
   service                   IN VARCHAR2 DEFAULT NULL,
   logging_level             IN PLS_INTEGER
                                DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
   log_history               IN PLS_INTEGER DEFAULT NULL,
   comments                  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 93–12 CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	The name of the class being created. A schema other than SYS cannot be specified. This attribute specifies the name of the job class and uniquely identifies the job class. The name has to be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.
