# Preface

---

Both novice users and those familiar with the SunOS operating system can use online man pages to obtain information about the system and its features. A man page is intended to answer concisely the question “What does it do?” The man pages in general comprise a reference manual. They are not intended to be a tutorial.

---

## Overview

The following contains a brief description of each man page section and the information it references:

- Section 1 describes, in alphabetical order, commands available with the operating system.
- Section 1M describes, in alphabetical order, commands that are used chiefly for system maintenance and administration purposes.
- Section 2 describes all of the system calls. Most of these calls have one or more error returns. An error condition is indicated by an otherwise impossible returned value.
- Section 3 describes functions found in various libraries, other than those functions that directly invoke UNIX system primitives, which are described in Section 2.
- Section 4 outlines the formats of various files. The C structure declarations for the file formats are given where applicable.
- Section 5 contains miscellaneous documentation such as character-set tables.
- Section 6 contains available games and demos.
- Section 7 describes various special files that refer to specific hardware peripherals and device drivers. STREAMS software drivers, modules and the STREAMS-generic set of system calls are also described.

- Section 9 provides reference information needed to write device drivers in the kernel environment. It describes two device driver interface specifications: the Device Driver Interface (DDI) and the Driver/Kernel Interface (DKI).
- Section 9E describes the DDI/DKI, DDI-only, and DKI-only entry-point routines a developer can include in a device driver.
- Section 9F describes the kernel functions available for use by device drivers.
- Section 9S describes the data structures used by drivers to share information between the driver and the kernel.

Below is a generic format for man pages. The man pages of each manual section generally follow this order, but include only needed headings. For example, if there are no bugs to report, there is no BUGS section. See the `intro` pages for more information and detail about each section, and `man(1)` for more information about man pages in general.

NAME	This section gives the names of the commands or functions documented, followed by a brief description of what they do.
SYNOPSIS	This section shows the syntax of commands or functions. When a command or file does not exist in the standard path, its full path name is shown. Options and arguments are alphabetized, with single letter arguments first, and options with arguments next, unless a different argument order is required.
	The following special characters are used in this section:
[ ]	Brackets. The option or argument enclosed in these brackets is optional. If the brackets are omitted, the argument must be specified.
. . .	Ellipses. Several values can be provided for the previous argument, or the previous argument can be specified multiple times, for example, "filename ...".
	Separator. Only one of the arguments separated by this character can be specified at a time.
{ }	Braces. The options and/or arguments enclosed within braces are interdependent, such that everything enclosed must be treated as a unit.

PROTOCOL	This section occurs only in subsection 3R to indicate the protocol description file.
DESCRIPTION	This section defines the functionality and behavior of the service. Thus it describes concisely what the command does. It does not discuss OPTIONS or cite EXAMPLES. Interactive commands, subcommands, requests, macros, and functions are described under USAGE.
IOCTL	This section appears on pages in Section 7 only. Only the device class that supplies appropriate parameters to the <code>ioctl(2)</code> system call is called <code>ioctl</code> and generates its own heading. <code>ioctl</code> calls for a specific device are listed alphabetically (on the man page for that specific device). <code>ioctl</code> calls are used for a particular class of devices all of which have an <code>io</code> ending, such as <code>mtio(7I)</code> .
OPTIONS	This section lists the command options with a concise summary of what each option does. The options are listed literally and in the order they appear in the SYNOPSIS section. Possible arguments to options are discussed under the option, and where appropriate, default values are supplied.
OPERANDS	This section lists the command operands and describes how they affect the actions of the command.
OUTPUT	This section describes the output – standard output, standard error, or output files – generated by the command.
RETURN VALUES	If the man page documents functions that return values, this section lists these values and describes the conditions under which they are returned. If a function can return only constant values, such as 0 or -1, these values are listed in tagged paragraphs. Otherwise, a single paragraph describes the return values of each function. Functions declared void do not return values, so they are not discussed in RETURN VALUES.
ERRORS	On failure, most functions place an error code in the global variable <code>errno</code> indicating why they failed. This section lists alphabetically all error codes a function can generate and describes the

	<p>conditions that cause each error. When more than one condition can cause the same error, each condition is described in a separate paragraph under the error code.</p>
USAGE	<p>This section lists special rules, features, and commands that require in-depth explanations. The subsections listed here are used to explain built-in functionality:</p> <ul style="list-style-type: none"> <li>Commands</li> <li>Modifiers</li> <li>Variables</li> <li>Expressions</li> <li>Input Grammar</li> </ul>
EXAMPLES	<p>This section provides examples of usage or of how to use a command or function. Wherever possible a complete example including command-line entry and machine response is shown. Whenever an example is given, the prompt is shown as <code>example%</code>, or if the user must be superuser, <code>example#</code>. Examples are followed by explanations, variable substitution rules, or returned values. Most examples illustrate concepts from the SYNOPSIS, DESCRIPTION, OPTIONS, and USAGE sections.</p>
ENVIRONMENT VARIABLES	<p>This section lists any environment variables that the command or function affects, followed by a brief description of the effect.</p>
EXIT STATUS	<p>This section lists the values the command returns to the calling program or shell and the conditions that cause these values to be returned. Usually, zero is returned for successful completion, and values other than zero for various error conditions.</p>
FILES	<p>This section lists all file names referred to by the man page, files of interest, and files created or required by commands. Each is followed by a descriptive summary or explanation.</p>
ATTRIBUTES	<p>This section lists characteristics of commands, utilities, and device drivers by defining the attribute type and its corresponding value. See <code>attributes(5)</code> for more information.</p>
SEE ALSO	<p>This section lists references to other man pages, in-house documentation, and outside publications.</p>

DIAGNOSTICS	This section lists diagnostic messages with a brief explanation of the condition causing the error.
WARNINGS	This section lists warnings about special conditions which could seriously affect your working conditions. This is not a list of diagnostics.
NOTES	This section lists additional information that does not belong anywhere else on the page. It takes the form of an aside to the user, covering points of special interest. Critical information is never covered here.
BUGS	This section describes known bugs and, wherever possible, suggests workarounds.

# Introduction

---

Intro(3)

<b>NAME</b>	Intro – introduction to functions and libraries
<b>DESCRIPTION</b>	This section describes functions found in various Solaris libraries, other than those functions described in Section 2 of this manual that directly invoke UNIX system primitives. Function declarations can be obtained from the <code>#include</code> files indicated on each page. Pages are grouped by library and are identified by the library name (or an abbreviation of the library name) after the section number. Collections of related libraries are grouped into five volumes as described below. A sixth volume (listed first) contains pages describing the contents of each shared library and each header used by the functions, macros, and external variables described in the remaining five volumes.
<b>Library Interfaces and Headers</b>	<p>This volume describes the contents of each shared library and each header used by functions, macros, and external variables described in the remaining five volumes.</p> <p>(3LIB) The libraries described in this section are implemented as shared objects.</p> <p>Descriptions of shared objects may include a definition of the global symbols that define the shared objects' public interface, for example <code>SUNW_1.1</code>. Other interfaces may exist within the shared object, for example <code>SUNW_private.1.1</code>. The public interface provides a stable, committed set of symbols for application development. The private interfaces are for internal use only, and may change at any time.</p> <p>(3LIBUCB) The SunOS/BSD Compatibility libraries described in this section are implemented as a shared object. See (3LIB) above.</p> <p>(3HEAD) The headers described in this section are used by functions, macros, and external variables. Headers contain function prototypes, definitions of symbolic constants, common structures, preprocessor macros, and defined types. Each function described in the remaining five volumes specifies the headers that an application must include in order to use that function. In most cases only one header is required. These headers are present on an application development system; they do have to be present on the target execution system.</p>
<b>Basic Library Functions</b>	<p>The functions described in this volume are the core C library functions that are basic to application development.</p> <p>(3C) These functions, together with those of Section 2, constitute the standard C library, <code>libc</code>, which is automatically linked by the C compilation system. The standard C library is implemented as a shared object, <code>libc.so</code>. See <code>libc(3LIB)</code> and the "C Compilation System" chapter of the <i>ANSI C Programmer's Guide</i> for a discussion. Some functions behave differently in standard-conforming environments. This behavior is noted on the individual manual pages. See <code>standards(5)</code>.</p>

## Networking Library Functions

- The `libpthread` and `libthread` libraries are filter libraries on `libc` that are used for building multithreaded applications: `libpthread` implements the POSIX (see `standards(5)`) threads interface, whereas `libthread` implements the Solaris threads interface. See `MULTITHREADED APPLICATIONS`, below.
- (3C\_DB) These functions constitute the threads debugging library, `libc_db`. This library is implemented as a shared object, `libc_db.so`, but is not automatically linked by the C compilation system. Specify `-lc_db` on the `cc` command line to link with this library. See `libc_db(3LIB)`.
- (3MALLOC) These functions constitute the various memory allocation libraries: `libmalloc`, `libbsdmalloc`, `libmapmalloc`, `libmtmalloc`, and `libumem`. Each of these libraries is implemented as a shared object (`libmalloc.so`, `libbsdmalloc.so`, `libmapmalloc.so`, `libmtmalloc.so`, and `libumem.so`). These libraries are not automatically linked by the C compilation system. Specify `-lmalloc`, `-lbsdmalloc`, `-lmapmalloc`, `-lmtmalloc`, and `-lumem` to link with, respectively, `libmalloc`, `libbsdmalloc`, `libmapmalloc`, `libmtmalloc`, and `libumem`. See `libmalloc(3LIB)`, `libbsdmalloc(3LIB)`, `libmapmalloc(3LIB)`, `libmtmalloc(3LIB)`, and `libumem(3LIB)`.
- (3UCB) These functions constitute the Source Compatibility (with BSD functions) library. It is implemented as a shared object, `libucb.so`, but is not automatically linked by the C compilation system. Specify `-lucb` on the `cc` command line to link with this library, which is located in the `/usr/ucb` subdirectory. Headers for this library are located within `/usr/ucbinclude`. See `libucb(3LIBUCB)`.
- The functions described in this volume comprise the various networking libraries.
- (3GSS) The functions in this library are the routines that comprise the Generic Security Services API library. This library is implemented as a shared object, `libgss.so`, but it is not automatically linked by the C compilation system. Specify `-lgss` on the `cc` command line to link with this library. See `libgss(3LIB)`.
- (3LDAP) These functions constitute the Lightweight Directory Access Protocol library, `libldap`. This library is implemented as a shared object, `libldap.so`, but is not automatically linked by the C compilation system. Specify `-lldap` on the `cc` command line to link with this library. See `ldap(3LDAP)`.

## Intro(3)

- (3NSL) These functions constitute the Network Service Library, `libnsl`. This library is implemented as a shared object, `libnsl.so`, but is not automatically linked by the C compilation system. Specify `-lnsl` on the `cc` command line to link with this library. See [libnsl\(3LIB\)](#).
- Many base networking functions are also available in the X/Open Networking Interfaces library, `libxnet`. See section (3XNET) below for more information on the `libxnet` interfaces.
- (3RAC) These functions constitute the remote asynchronous calls library, `librac`. This library is implemented as a shared object, `librac.so`, but is not automatically linked by the C compilation system. Specify `-lrac` on the `cc` command line to link with this library. See [librac\(3LIB\)](#).
- (3RESOLV) These functions constitute the resolver library, `libresolv`. This library is implemented as a shared object, `libresolv.so`, but is not automatically linked by the C compilation system. Specify `-lresolv` on the `cc` command line to link with this library. See [libresolv\(3LIB\)](#).
- (3RPC) These functions constitute the remote procedure call libraries, `librpcsvc` and `librpcsoc`. The latter is provided for compatibility only; new applications should not link to it. Both libraries are implemented as shared objects, `librpcsvc.so` and `librpcsoc.so`, respectively. Neither library is automatically linked by the C compilation system. Specify `-lrpcsvc` or `-lrpcsoc` on the `cc` command line to link with these libraries. See [librpcsvc\(3LIB\)](#) and [librpcsoc\(3LIBUCB\)](#).
- (3SLP) These functions constitute the Service Location Protocol library, `libslp`. This library is implemented as a shared object, `libslp.so`, but it is not automatically linked by the C compilation system. See [libslp\(3LIB\)](#).
- (3SASL) These functions constitute the Simple Authentication and Security Layer (SASL) library, `libsasl`. SASL is a security framework used by connection-oriented network applications primarily for authentication. Another way to describe SASL is that it is a glue layer between a network application and some security mechanisms that allow applications to authenticate each other and provide additional security services such as data encryption. As a glue layer, SASL hides the interface specifics of the security mechanism from the application, which allows greater portability and flexibility as new security mechanisms are implemented.
- `libsasl` provides both an API for applications and an SPI for various plug-ins. To link with this library, specify `-lsasl` on the `cc` command line. See [libsasl\(3LIB\)](#).

- (3SOCKET) These functions constitute the sockets library, `libsocket`. This library is implemented as a shared object, `libsocket.so`, but is not automatically linked by the C compilation system. Specify `-lsocket` on the `cc` command line to link with this library. See [libsocket\(3LIB\)](#).
- (3XNET) These functions constitute X/Open networking interfaces which comply with the X/Open CAE Specification, Networking Services, Issue 4 (September, 1994). This library is implemented as a shared object, `libxnet.so`, but is not automatically linked by the C compilation system. Specify `-lxnet` on the `cc` command line to link with this library. See [libxnet\(3LIB\)](#) and [standards\(5\)](#) for compilation information.

Under all circumstances, the use of the Sockets API is recommended over the XTI and TLI APIs. If portability to other XPGV4v2 (see [standards\(5\)](#)) systems is a requirement, the application must use the `libxnet` interfaces. If portability is not required, the sockets interfaces in `libsocket` and `libnsl` are recommended over those in `libxnet`. Between the XTI and TLI APIs, the XTI interfaces (available with `libxnet`) are recommended over the TLI interfaces (available with `libnsl`).

### Curses Library Functions

The functions described in this volume comprise the libraries that provide graphics and character screen updating capabilities.

- (3CURSES) The functions constitute the following libraries:
- |                        |   |
|------------------------|---|
| <code>libcurses</code> | These functions constitute the curses library, <code>libcurses</code> . This library is implemented as a shared object, <code>libcurses.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lcurses</code> on the <code>cc</code> command line to link with this library. See <a href="#">libcurses(3LIB)</a> . |
| <code>libform</code>   | These functions constitute the forms library, <code>libform</code> . This library is implemented as a shared object, <code>libform.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lform</code> on the <code>cc</code> command line to link with this library. See <a href="#">libform(3LIB)</a> .          |
| <code>libmenu</code>   | These functions constitute the menus library, <code>libmenu</code> . This library is implemented as a shared object, <code>libmenu.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lmenu</code> on the <code>cc</code> command line to link with this library. See <a href="#">libmenu(3LIB)</a> .          |

## Intro(3)

	<code>libpanel</code>	These functions constitute the panels library, <code>libpanel</code> . This library is implemented as a shared object, <code>libpanel.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lpanel</code> on the <code>cc</code> command line to link with this library. See <a href="#">libpanel(3LIB)</a> .
(3PLOT)		These functions constitute the graphics library, <code>libplot</code> . This library is implemented as a shared object, <code>libplot.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lplot</code> on the <code>cc</code> command line to link with this library. See <a href="#">libplot(3LIB)</a> .
(3XCURSES)		These functions constitute the X/Open Curses library, located in <code>/usr/xpg4/lib/libcurses.so</code> . This library provides a set of internationalized functions and macros for creating and modifying input and output to a terminal screen. Included in this library are functions for creating windows, highlighting text, writing to the screen, reading from user input, and moving the cursor. X/Open Curses is designed to optimize screen update activities. The X/Open Curses library conforms fully with Issue 4 of the X/Open Extended Curses specification.
<b>Realtime Library Functions</b>		The functions described in this volume constitute the realtime libraries.
(3AIO)		These functions constitute the asynchronous I/O library, <code>libaio</code> . This library is implemented as a shared object, <code>libaio.so</code> , but is not automatically linked by the C compilation system. Specify <code>-laio</code> on the <code>cc</code> command line to link with this library. See <a href="#">libaio(3LIB)</a> .
(3DOOR)		These functions constitute the doors library, <code>libdoor</code> . This library is implemented as a shared object, <code>libdoor.so</code> , but is not automatically linked by the C compilation system. Specify <code>-ldoor</code> on the <code>cc</code> command line to link with this library.
(3RT)		These functions constitute the POSIX.4 Realtime library, <code>librt</code> . It is implemented as a shared object, <code>librt.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lrt</code> on the <code>cc</code> command line to link with this library. Note that the former name for this library, <code>libposix4</code> , is maintained for backward compatibility but should be avoided. See <a href="#">librt(3LIB)</a> .
<b>Extended Library Functions</b>		The functions described in this volume comprise various specialized libraries that are not limited to the following:

- (3BSM) These functions constitute the basic security library, `libbasm`. This library is implemented as a shared object, `libbasm.so`, but is not automatically linked by the C compilation system. Specify `-lbasm` on the `cc` command line to link with this library. See [libbasm\(3LIB\)](#).
- (3CFGADM) These functions constitute the configuration administration library, `libcfgadm`. This library is implemented as a shared object, `libcfgadm.so`, but is not automatically linked by the C compilation system. Specify `-lcfgadm` on the `cc` command line to link with this library. See [libcfgadm\(3LIB\)](#).
- (3CONTRACT) These functions constitute the contract management library, `libcontract`. This library is implemented as a shared object, `libcontract.so`, but is not automatically linked by the C compilation system. Specify `-lcontract` on the `cc` command line to link with this library. See [libcontract\(3LIB\)](#).
- (3CPC) These functions constitute the CPU performance counter library, `libcpc`, and the process context library, `libpctx`. These libraries are implemented as shared objects, `libcpc.so` and `libpctx.so`, respectively, but are not automatically linked by the C compilation system. Specify `-lcpc` or `-lpctx` on the `cc` command line to link with these libraries. See [libcpc\(3LIB\)](#) and [libpctx\(3LIB\)](#).
- (3DAT) These functions constitute the direct access transport library, `libdevdat`. This library is implemented as a shared object, `libdevdat.so`, but is not automatically linked by the C compilation system. Specify `-ldat` on the `cc` command line to link with this library. See [libdevdat\(3LIB\)](#).
- (3DEVID) These functions constitute the device ID library, `libdevvid`. This library is implemented as a shared object, `libdevvid.so`, but is not automatically linked by the C compilation system. Specify `-ldevvid` on the `cc` command line to link with this library. See [libdevvid\(3LIB\)](#).
- (3DEVINFO) These functions constitute the device information library, `libdevinfo`. This library is implemented as a shared object, `libdevinfo.so`, but is not automatically linked by the C compilation system. Specify `-ldevinfo` on the `cc` command line to link with this library. See [libdevinfo\(3LIB\)](#).
- (3DMI) These functions constitute the DMI libraries, `libdmi`, `libdmici`, and `libdmimi`. These libraries are implemented as shared objects, `libdmi.so`, `libdmici.so`, and `libdmimi.so`, respectively, but are not automatically linked by the C compilation system. Specify `-ldmi`, `-ldmici`, or `-ldmimi` on the `cc` command line to link with these libraries. See [libdmi\(3LIB\)](#), [libdmici\(3LIB\)](#), and [libdmimi\(3LIB\)](#).

## Intro(3)

- (3ELF) These functions constitute the ELF access library, `libelf`, (Extensible Linking Format). This library provides the interface for the creation and analyses of “elf” files; executables, objects, and shared objects. `libelf` is implemented as a shared object, `libelf.so`, but is not automatically linked by the C compilation system. Specify `-lelf` on the `cc` command line to link with this library. See [libelf\(3LIB\)](#).
- (3EXACCT) These functions constitute the extended accounting access library, `libexacct`, and the project database access library, `libproject`. These libraries are implemented as shared objects, `libexacct.so` and `libproject.so`, respectively, but are not automatically linked by the C compilation system. Specify `-lexacct` or `-lproject` on the `cc` command line to link with these libraries. See [libexacct\(3LIB\)](#) and [libproject\(3LIB\)](#).
- (3GEN) These functions constitute the string pattern-matching and pathname manipulation library, `libgen`. This library is implemented as a shared object, `libgen.so`, but is not automatically linked by the C compilation system. Specify `-lgen` on the `cc` command line to link with this library. See [libgen\(3LIB\)](#).
- (3HBAAPI) These functions constitute the common fibre channel HBA information library, `libhbaapi`. This library is implemented as a shared object, `libhbaapi.so`, but is not automatically linked by the C compilation system. Specify `-lhbaapi` on the `cc` command line to link with this library. See [libhbaapi\(3LIB\)](#).
- (3KSTAT) These functions constitute the kernel statistics library, which is implemented as a shared object, `libkstat.so`, but is not automatically linked by the C compilation system. Specify `-lkstat` on the `cc` command line to link with this library. See [libkstat\(3LIB\)](#).
- (3KVM) These functions allow access to the kernel’s virtual memory library, which is implemented as a shared object, `libkvm.so`, but is not automatically linked by the C compilation system. Specify `-lkvm` on the `cc` command line to link with this library. See [libkvm\(3LIB\)](#).
- (3LAYOUT) These functions constitute the layout service library, which is implemented as a shared object, `liblayout.so`, but is not automatically linked by the C compilation system. Specify `-llayout` on the `cc` command line to link with this library. See [liblayout\(3LIB\)](#).

- (3LGRP) These functions constitute the locality group library, which is implemented as a shared object, `liblgrp.so`, but is not automatically linked by the C compilation system. Specify `-llgrp` on the `cc` command line to link with this library. See [liblgrp\(3LIB\)](#).
- (3M) These functions constitute the mathematical library, `libm`. This library is implemented as a shared object, `libm.so`, but is not automatically linked by the C compilation system. Specify `-lm` on the `cc` command line to link with this library.
- (3MAIL) These functions constitute the user mailbox management library, `libmail`. This library is implemented as a shared object, `libmail.so`, but is not automatically linked by the C compilation system. Specify `-lmail` on the `cc` command line to link with this library.
- (3MP) These functions constitute the integer mathematical library, `libmp`. This library is implemented as a shared object, `libmp.so`, but is not automatically linked by the C compilation system. Specify `-lmp` on the `cc` command line to link with this library. See [libmp\(3LIB\)](#).
- (3NVPAIR) These functions constitute the name–value pair library, `libnvpair`. This library is implemented as a shared object, `libnvpair.so`, but is not automatically linked by the C compilation system. Specify `-lnvpair` on the `cc` command line to link with this library. See [libnvpair\(3LIB\)](#).
- (3PAM) These functions constitute the Pluggable Authentication Module (PAM) library, `libpam`. This library is implemented as a shared object, `libpam.so`, but is not automatically linked by the C compilation system. Specify `-lpam` on the `cc` command line to link with this library. See [libpam\(3LIB\)](#).
- (3PICL) These functions constitute the PICL library, `libpicl`. This library is implemented as a shared object, `libpicl.so`, but is not automatically linked by the C compilation system. Specify `-lpicl` on the `cc` command line to link with this library. See [libpicl\(3LIB\)](#) and [libpicl\(3PICL\)](#).
- (3PICLTREE) These functions constitute the PICL plug-in library, `libpicltree`. This library is implemented as a shared object, `libpicltree.so`, but is not automatically linked by the C compilation system. Specify `-lpicltree` on the `cc` command line to link with this library. See [libpicltree\(3LIB\)](#) and [libpicltree\(3PICLTREE\)](#).

## Intro(3)

- |              |  |
|--------------|--|
| (3POOL)      | These functions constitute the pool configuration manipulation library, <code>libpool</code> . This library is implemented as a shared object, <code>libpool.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lpool</code> on the <code>cc</code> command line to link with this library. See <a href="#">libpool(3LIB)</a> .   |
| (3PROJECT)   | These functions constitute the project database access library, <code>libproject</code> . This library is implemented as a shared object, <code>libproject.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lproject</code> on the <code>cc</code> command line to link with this library. See <a href="#">libproject(3LIB)</a> .   |
| (3RSM)       | These functions constitute the remote shared memory library, <code>librsm</code> . This library is implemented as a shared object, <code>librsm.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lrsm</code> on the <code>cc</code> command line to link with this library. See <a href="#">librsm(3LIB)</a> .  |
| (3SCF)       | These functions constitute the object-caching memory allocation library, <code>libscf</code> . This library is implemented as a shared object, <code>libscf.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lscf</code> on the <code>cc</code> command line to link with this library. See <a href="#">libscf(3LIB)</a> .  |
| (3SEC)       | These functions constitute the file access control library, <code>libsec</code> . This library is implemented as a shared object, <code>libsec.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lsec</code> on the <code>cc</code> command line to link with this library. See <a href="#">libsec(3LIB)</a> .   |
| (3SECDB)     | These functions constitute the security attributes database library, <code>libsecdb</code> . This library is implemented as a shared object, <code>libsecdb.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lsecdb</code> on the <code>cc</code> command line to link with this library. See <a href="#">libsecdb(3LIB)</a> .  |
| (3SMARTCARD) | These functions constitute the smartcard library, <code>libsmartcard</code> . This library is implemented as a shared object, <code>libsmartcard.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lsmartcard</code> on the <code>cc</code> command line to link with this library. See <a href="#">libsmartcard(3LIB)</a> .   |
| (3SNMP)      | These functions constitute the SNMP libraries, <code>libssagent</code> and <code>libssasnmp</code> . These libraries are implemented as shared objects, <code>libssagent.so</code> and <code>libssasnmp.so</code> , respectively, but are not automatically linked by the C compilation system. Specify <code>-lssagent</code> or <code>-lssasnmp</code> on the <code>cc</code> command line to link with these libraries. See <a href="#">libssagent(3LIB)</a> and <a href="#">libssasnmp(3LIB)</a> . |

<b>Multimedia Library Functions</b>	(3SYSEVENT)	These functions constitute the system event library, <code>libsysevent</code> . This library is implemented as a shared object, <code>libsysevent.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lsysevent</code> on the <code>cc</code> command line to link with this library. See <a href="#">libsysevent(3LIB)</a> .
	(3TECLA)	These functions constitute the interactive command-line input library, <code>libtecla</code> . This library is implemented as a shared object, <code>libtecla.so</code> , but is not automatically linked by the C compilation system. Specify <code>-ltecla</code> on the <code>cc</code> command line to link with this library. See <a href="#">libtecla(3LIB)</a> .
	(3TNF)	These functions constitute the TNF libraries, <code>libtnf</code> , <code>libtnfctl</code> , and <code>libtnfprobe</code> . These libraries are implemented as shared objects, <code>libtnf.so</code> , <code>libtnfctl.so</code> , and <code>libtnfprobe.so</code> , respectively, but are not automatically linked by the C compilation system. Specify <code>-ltnf</code> , <code>-ltnfctl</code> , or <code>-ltnfprobe</code> on the <code>cc</code> command line to link with these libraries. See <a href="#">libtnfctl(3TNF)</a> and <a href="#">libtnfctl(3LIB)</a> .
	(3UUID)	These functions constitute the universally unique identifier library, <code>libuuid</code> . This library is implemented as a shared object, <code>libuuid.so</code> , but is not automatically linked by the C compilation system. Specify <code>-luuid</code> on the <code>cc</code> command line to link with this library. See <a href="#">libuuid(3LIB)</a> .
	(3VOLMGT)	These functions constitute the volume management library, <code>libvolmgt</code> . This library is implemented as a shared object, <code>libvolmgt.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lvolmgt</code> on the <code>cc</code> command line to link with this library. See <a href="#">libvolmgt(3LIB)</a> .
	(3WSREG)	These functions constitute the product install registry library, <code>libwsreg</code> . This library is implemented as a shared object, <code>libwsreg.so</code> , but is not automatically linked by the C compilation system. Specify <code>-lwsreg</code> on the <code>cc</code> command line to link with this library. See <a href="#">libwsreg(3LIB)</a> .
	(3MLIB)	These functions constitute the mediaLib library, <code>libmlib</code> . This library is implemented as a shared object, <code>libmlib.so</code> , but is not automatically linked by the C compilation system. Specify <code>-mlib</code> on the <code>cc</code> command line to link with this library. See <a href="#">libmlib(3LIB)</a> .
<b>DEFINITIONS</b>	A character is any bit pattern able to fit into a byte on the machine. In some international languages, however, a “character” may require more than one byte, and is represented in multi-bytes.	

## Intro(3)

The null character is a character with value 0, conventionally represented in the C language as `\0`. A character array is a sequence of characters. A null-terminated character array (a *string*) is a sequence of characters, the last of which is the null character. The null string is a character array containing only the terminating null character. A null pointer is the value that is obtained by casting 0 into a pointer. C guarantees that this value will not match that of any legitimate pointer, so many functions that return pointers return NULL to indicate an error. The macro NULL is defined in `<stdio.h>`. Types of the form `size_t` are defined in the appropriate headers.

## MULTITHREADED APPLICATIONS

Both POSIX threads and Solaris threads can be used within the same application. Their implementations are completely compatible with each other; however, only POSIX threads guarantee portability to other POSIX-conforming environments.

The `libpthread(3LIB)` and `libthread(3LIB)` libraries are implemented as filters on `libc(3LIB)`.

When compiling a multithreaded application, the `-mt` option must be specified on the command line.

There is no need for a multithreaded application to link with `-lthread`. An application must link with `-lpthread` only when POSIX semantics for `fork(2)` are desired. When an application is linked with `-lpthread`, a call to `fork()` assumes the behavior `fork1(2)` rather than the default behavior that forks all threads.

When compiling a POSIX-conforming application, either the `_POSIX_C_SOURCE` or `_POSIX_PTHREAD_SEMANTICS` option must be specified on the command line. For POSIX.1c-conforming applications, define the `_POSIX_C_SOURCE` flag to be `>= 199506L`:

```
cc -mt [ flag... ] file... -D_POSIX_C_SOURCE=199506L -lpthread
```

For POSIX behavior with the Solaris `fork()` and `fork1()` distinction, compile as follows:

```
cc -mt [ flag... ] file... -D_POSIX_PTHREAD_SEMANTICS
```

For Solaris threads behavior, compile as follows:

```
cc -mt [ flag... ] file...
```

Unsafe interfaces should be called only from the main thread to ensure the application's safety.

MT-Safe interfaces are denoted in the `ATTRIBUTES` section of the functions and libraries manual pages (see `attributes(5)`). If a manual page does not state explicitly that an interface is MT-Safe, the user should assume that the interface is unsafe.

## REALTIME APPLICATIONS

The environment variable `LD_BIND_NOW` must be set to a non-null value to enable early binding. Refer to the "When Relocations are Processed" chapter in *Linker and Libraries Guide* for additional information.

<b>FILES</b>	<p><i>INCDIR</i> usually <code>/usr/include</code></p> <p><i>LIBDIR</i> usually either <code>/lib</code> or <code>/usr/lib</code> (32-bit) or either <code>/lib/64</code> or <code>/usr/lib/64</code> (64-bit)</p> <p><i>LIBDIR/*.so</i> shared libraries</p>
<b>SEE ALSO</b>	<p><code>ar(1)</code>, <code>cc(1B)</code>, <code>ld(1)</code>, <code>fork(2)</code>, <code>stdio(3C)</code>, <code>attributes(5)</code>, <code>standards(5)</code></p> <p><i>Linker and Libraries Guide</i></p> <p><i>Profiling Tools</i></p> <p><i>ANSI C Programmer's Guide</i></p>
<b>DIAGNOSTICS</b>	<p>For functions that return floating-point values, error handling varies according to compilation mode. Under the <code>-xt</code> (default) option to <code>cc</code>, these functions return the conventional values <code>0</code>, <code>±HUGE</code>, or <code>NaN</code> when the function is undefined for the given arguments or when the value is not representable. In the <code>-Xa</code> and <code>-Xc</code> compilation modes, <code>±HUGE_VAL</code> is returned instead of <code>±HUGE</code>. (<code>HUGE_VAL</code> and <code>HUGE</code> are defined in <code>math.h</code> to be infinity and the largest-magnitude single-precision number, respectively.)</p>
<b>NOTES</b>	<p>None of the functions, external variables, or macros should be redefined in the user's programs. Any other name may be redefined without affecting the behavior of other library functions, but such redefinition may conflict with a declaration in an included header.</p> <p>The headers in <i>INCDIR</i> provide function prototypes (function declarations including the types of arguments) for most of the functions listed in this manual. Function prototypes allow the compiler to check for correct usage of these functions in the user's program. The <code>lint</code> program checker may also be used and will report discrepancies even if the headers are not included with <code>#include</code> statements. Definitions for Sections 2, 3C, and 3S are checked automatically. Other definitions can be included by using the <code>-l</code> option to <code>lint</code>. (For example, <code>-lm</code> includes definitions for <code>libm</code>.) Use of <code>lint</code> is highly recommended. See the <code>lint</code> chapter in <i>Performance Profiling Tools</i>.</p> <p>Users should carefully note the difference between <code>STREAMS</code> and <i>stream</i>. <code>STREAMS</code> is a set of kernel mechanisms that support the development of network services and data communication drivers. It is composed of utility routines, kernel facilities, and a set of data structures. A <i>stream</i> is a file with its associated buffering. It is declared to be a pointer to a type <code>FILE</code> defined in <code>&lt;stdio.h&gt;</code>.</p> <p>In detailed definitions of components, it is sometimes necessary to refer to symbolic names that are implementation-specific, but which are not necessarily expected to be accessible to an application program. Many of these symbolic names describe boundary conditions and system limits.</p>

### Intro(3)

In this section, for readability, these implementation-specific values are given symbolic names. These names always appear enclosed in curly brackets to distinguish them from symbolic names of other implementation-specific constants that are accessible to application programs by headers. These names are not necessarily accessible to an application program through a header, although they may be defined in the documentation for a particular system.

In general, a portable application program should not refer to these symbolic names in its code. For example, an application program would not be expected to test the length of an argument list given to a routine to determine if it was greater than `{ARG_MAX}`.

# Library Interfaces and Headers

---

acct.h(3HEAD)

<b>NAME</b>	acct.h, acct – per-process accounting file format
<b>SYNOPSIS</b>	<pre>#include &lt;sys/types.h&gt; #include &lt;sys/acct.h&gt;</pre>
<b>DESCRIPTION</b>	<p>Files produced as a result of calling acct(2) have records in the form defined by &lt;sys/acct.h&gt;, whose contents are:</p> <pre>typedef ushort_t  comp_t;  /* pseudo "floating point" representation */                         /* 3 bit base-8 exponent in the high */                         /* order bits, and a 13-bit fraction */                         /* in the low order bits. */  struct    acct {     char    ac_flag;      /* Accounting flag */     char    ac_stat;     /* Exit status */     uid_t   ac_uid;      /* Accounting user ID */     gid_t   ac_gid;     /* Accounting group ID */     dev_t   ac_tty;     /* control tty */     time_t  ac_btime;    /* Beginning time */     comp_t  ac_utime;    /* accounting user time in clock ticks */     comp_t  ac_stime;    /* accounting system time in clock ticks */     comp_t  ac_etime;    /* accounting total elapsed time in clock ticks */     comp_t  ac_mem;     /* memory usage in clicks (pages) */     comp_t  ac_io;      /* chars transferred by read/write */     comp_t  ac_rw;     /* number of block reads/writes */     char    ac_comm[8]; /* command name */ };  /*  * Accounting Flags  */  #define AFORK    01    /* has executed fork, but no exec */ #define ASU     02    /* used super-user privileges */ #define ACCTF   0300  /* record type */ #define AEXPND  040   /* Expanded Record Type - default */</pre> <p>In ac_flag, the AFORK flag is turned on by each fork and turned off by an exec. The ac_comm field is inherited from the parent process and is reset by any exec. Each time the system charges the process with a clock tick, it also adds to ac_mem the current process size, computed as follows:</p> $(data\ size) + (text\ size) / (number\ of\ in-core\ processes\ using\ text)$ <p>The value of ac_mem / (ac_stime + ac_utime) can be viewed as an approximation to the mean process size, as modified by text sharing.</p> <p>The structure tacct, (which resides with the source files of the accounting commands), represents a summary of accounting statistics for the user id ta_uid. This structure is used by the accounting commands to report statistics based on user id.</p> <pre>/*  * total accounting (for acct period), also for day</pre>

```

*/
struct tacct {
    uid_t      ta_uid;      /* user id */
    char       ta_name[8];  /* login name */
    float      ta_cpu[2];   /* cum. cpu time in minutes, */
                          /* p/np (prime/non-prime time) */
    float      ta_kcore[2]; /* cum. kcore-minutes, p/np */
    float      ta_con[2];   /* cum. connect time in minutes, p/np */
    float      ta_du;       /* cum. disk usage (blocks)*/
    long       ta_pc;       /* count of processes */
    unsigned short ta_sc;   /* count of login sessions */
    unsigned short ta_dc;   /* count of disk samples */
    unsigned short ta_fee;  /* fee for special services */
};

```

The `ta_cpu`, `ta_kcore`, and `ta_con` members contain usage information pertaining to prime time and non-prime time hours. The first element in each array represents the time the resource was used during prime time hours. The second element in each array represents the time the resource was used during non-prime time hours. Prime time and non-prime time hours may be set in the `holidays` file (see `holidays(4)`).

The `ta_kcore` member is a cumulative measure of the amount of memory used over the accounting period by processes owned by the user with `uid ta_uid`. The amount shown represents kilobyte segments of memory used, per minute.

The `ta_con` member represents the amount of time the user was logged in to the system.

**FILES** /etc/acct/holidays      prime/non-prime time table

**SEE ALSO** `acctcom(1)`, `acct(1M)`, `acctcon(1M)`, `acctmerg(1M)`, `acctprc(1M)`, `acctsh(1M)`, `prtacct(1M)`, `runacct(1M)`, `shutacct(1M)`, `acct(2)`, `exec(2)`, `fork(2)`

**NOTES** The `ac_mem` value for a short-lived command gives little information about the actual size of the command, because `ac_mem` may be incremented while a different command (for example, the shell) is being executed by the process.

## aio.h(3HEAD)

<b>NAME</b>	aio.h, aio – asynchronous input and output																																					
<b>SYNOPSIS</b>	#include <aio.h>																																					
<b>DESCRIPTION</b>	<p>The &lt;aio.h&gt; header defines the <code>aio_cb</code> structure which includes the following members:</p> <table><tr><td>int</td><td><code>aio_fildes</code></td><td>file descriptor</td></tr><tr><td>off_t</td><td><code>aio_offset</code></td><td>file offset</td></tr><tr><td>volatile void*</td><td><code>aio_buf</code></td><td>location of buffer</td></tr><tr><td>size_t</td><td><code>aio_nbytes</code></td><td>length of transfer</td></tr><tr><td>int</td><td><code>aio_reqprio</code></td><td>request priority offset</td></tr><tr><td>struct sigevent</td><td><code>aio_sigevent</code></td><td>signal number and value</td></tr><tr><td>int</td><td><code>aio_lio_opcode</code></td><td>operation to be performed</td></tr></table> <p>This header also includes the following constants:</p> <table><tr><td><code>AIO_ALLDONE</code></td><td>A return value indicating that none of the requested operations could be canceled since they are already complete.</td></tr><tr><td><code>AIO_CANCELED</code></td><td>A return value indicating that all requested operations have been canceled.</td></tr><tr><td><code>AIO_NOTCANCELED</code></td><td>A return value indicating that some of the requested operations could not be canceled since they are in progress.</td></tr><tr><td><code>LIO_NOP</code></td><td>A <code>lio_listio(3RT)</code> element operation option indicating that no transfer is requested.</td></tr><tr><td><code>LIO_NOWAIT</code></td><td>A <code>lio_listio()</code> synchronization operation indicating that the calling thread is to continue execution while the <code>lio_listio()</code> operation is being performed, and no notification is given when the operation is complete.</td></tr><tr><td><code>LIO_READ</code></td><td>A <code>lio_listio()</code> element operation option requesting a read.</td></tr><tr><td><code>LIO_WAIT</code></td><td>A <code>lio_listio()</code> synchronization operation indicating that the calling thread is to suspend until the <code>lio_listio()</code> operation is complete.</td></tr><tr><td><code>LIO_WRITE</code></td><td>A <code>lio_listio()</code> element operation option requesting a write.</td></tr></table>	int	<code>aio_fildes</code>	file descriptor	off_t	<code>aio_offset</code>	file offset	volatile void*	<code>aio_buf</code>	location of buffer	size_t	<code>aio_nbytes</code>	length of transfer	int	<code>aio_reqprio</code>	request priority offset	struct sigevent	<code>aio_sigevent</code>	signal number and value	int	<code>aio_lio_opcode</code>	operation to be performed	<code>AIO_ALLDONE</code>	A return value indicating that none of the requested operations could be canceled since they are already complete.	<code>AIO_CANCELED</code>	A return value indicating that all requested operations have been canceled.	<code>AIO_NOTCANCELED</code>	A return value indicating that some of the requested operations could not be canceled since they are in progress.	<code>LIO_NOP</code>	A <code>lio_listio(3RT)</code> element operation option indicating that no transfer is requested.	<code>LIO_NOWAIT</code>	A <code>lio_listio()</code> synchronization operation indicating that the calling thread is to continue execution while the <code>lio_listio()</code> operation is being performed, and no notification is given when the operation is complete.	<code>LIO_READ</code>	A <code>lio_listio()</code> element operation option requesting a read.	<code>LIO_WAIT</code>	A <code>lio_listio()</code> synchronization operation indicating that the calling thread is to suspend until the <code>lio_listio()</code> operation is complete.	<code>LIO_WRITE</code>	A <code>lio_listio()</code> element operation option requesting a write.
int	<code>aio_fildes</code>	file descriptor																																				
off_t	<code>aio_offset</code>	file offset

int	<code>aio_lio_opcode</code>	operation to be performed																																				
<code>AIO_ALLDONE</code>	A return value indicating that none of the requested operations could be canceled since they are already complete.																																					
<code>AIO_CANCELED</code>	A return value indicating that all requested operations have been canceled.																																					
<code>AIO_NOTCANCELED</code>	A return value indicating that some of the requested operations could not be canceled since they are in progress.																																					
<code>LIO_NOP</code>	A <code>lio_listio(3RT)</code> element operation option indicating that no transfer is requested.																																					
<code>LIO_NOWAIT</code>	A <code>lio_listio()</code> synchronization operation indicating that the calling thread is to continue execution while the <code>lio_listio()</code> operation is being performed, and no notification is given when the operation is complete.																																					
<code>LIO_READ</code>	A <code>lio_listio()</code> element operation option requesting a read.																																					
<code>LIO_WAIT</code>	A <code>lio_listio()</code> synchronization operation indicating that the calling thread is to suspend until the <code>lio_listio()</code> operation is complete.																																					
<code>LIO_WRITE</code>	A <code>lio_listio()</code> element operation option requesting a write.																																					
<b>SEE ALSO</b>	<code>lseek(2)</code> , <code>read(2)</code> , <code>write(2)</code> , <code>fsync(3C)</code> , <code>libaio(3LIB)</code> , <code>lio_listio(3RT)</code>																																					

<b>NAME</b>	ar.h, ar – archive file format
<b>SYNOPSIS</b>	<pre>#include &lt;ar.h&gt;</pre>
<b>DESCRIPTION</b>	<p>The archive command <code>ar</code> is used to combine several files into one. Archives are used mainly as libraries to be searched by the link editor <code>ld</code>.</p> <p>Each archive begins with the archive magic string.</p> <pre>#define ARMAG    "!&lt;arch&gt;\n"    /* magic string */ #define SARMAG   8              /* length of magic string */</pre> <p>Following the archive magic string are the archive file members. Each file member is preceded by a file member header which is of the following format:</p> <pre>#define ARFMAG   "\n"          /* header trailer string */  struct ar_hdr   /* file member header */ {     char    ar_name[16];      /* '/' terminated file member name */     char    ar_date[12];     /* file member date */     char    ar_uid[6];       /* file member user identification */     char    ar_gid[6];       /* file member group identification */     char    ar_mode[8];      /* file member mode (octal) */     char    ar_size[10];     /* file member size */     char    ar_fmag[2];      /* header trailer string */ };</pre> <p>All information in the file member headers is in printable ASCII. The numeric information contained in the headers is stored as decimal numbers (except for <code>ar_mode</code> which is in octal). Thus, if the archive contains printable files, the archive itself is printable.</p> <p>If the file member name fits, the <code>ar_name</code> field contains the name directly, and is terminated by a slash (/) and padded with blanks on the right. If the member's name does not fit, <code>ar_name</code> contains a slash (/) followed by a decimal representation of the name's offset in the archive string table described below.</p> <p>The <code>ar_date</code> field is the modification date of the file at the time of its insertion into the archive. Common format archives can be moved from system to system as long as the portable archive command <code>ar</code> is used.</p> <p>Each archive file member begins on an even byte boundary; a newline is inserted between files if necessary. Nevertheless, the size given reflects the actual size of the file exclusive of padding.</p> <p>Notice there is no provision for empty areas in an archive file.</p> <p>Each archive that contains object files (see a .out(4)) includes an archive symbol table. This symbol table is used by the link editor <code>ld</code> to determine which archive members must be loaded during the link edit process. The archive symbol table (if it exists) is always the first file in the archive (but is never listed) and is automatically created and/or updated by <code>ar</code>.</p>

ar.h(3HEAD)

The archive symbol table has a zero length name (that is, `ar_name[0]` is `'/'`), `ar_name[1]` is `' '`, etc.). All “words” in this symbol table have four bytes, using the machine-independent encoding shown below. All machines use the encoding described here for the symbol table, even if the machine’s “natural” byte order is different.

```
                                0      1      2      3
0x01020304      01      02      03      04
```

The contents of this file are as follows:

1. The number of symbols. Length: 4 bytes.
2. The array of offsets into the archive file. Length: 4 bytes \* “the number of symbols”.
3. The name string table. Length: `ar_size - 4 bytes * (“the number of symbols” + 1)`.

As an example, the following symbol table defines 4 symbols. The archive member at file offset 114 defines `name`. The archive member at file offset 122 defines `object`. The archive member at file offset 426 defines `function` and the archive member at file offset 434 defines `name2`.

### Example Symbol Table

Offset	+0	+1	+2	+3	
0	4				4 offset entries
4	114				name
8	122				object
12	426				function
16	434				name2
20	n	a	m	e	
24	\0	o	b	j	
28	e	c	t	\0	
32	f	u	n	c	
36	t	i	o	n	
40	\0	n	a	m	
44	e	2	\0		

The string table contains exactly as many null terminated strings as there are elements in the offsets array. Each offset from the array is associated with the corresponding name from the string table (in order). The names in the string table are all the defined global symbols found in the common object files in the archive. Each offset is the location of the archive header for the associated symbol.

If some archive member's name is more than 15 bytes long, a special archive member contains a table of file names, each followed by a slash and a new-line. This string table member, if present, will precede all "normal" archive members. The special archive symbol table is not a "normal" member, and must be first if it exists. The `ar_name` entry of the string table's member header holds a zero length name `ar_name[0] == '/'`, followed by one trailing slash (`ar_name[1] == '/'`), followed by blanks (`ar_name[2] == ' '`, etc.). Offsets into the string table begin at zero. Example `ar_name` values for short and long file names appear below.

Offset	+0	+1	+2	+3	+4	+5	+6	+7	+8	+9
0	f	i	l	e	_	n	a	m	e	_
10	s	a	m	p	l	e	/	\n	l	o
20	n	g	e	r	f	i	l	e	n	a
30	m	e	x	a	m	p	l	e	/	\n

  

Member Name	ar_name
short-name	short-name/   Not in string table
file_name_sample	/0   Offset 0 in string table
longerfilenameexample	/18   Offset 18 in string table

**SEE ALSO** `ar(1)`, `ld(1)`, `strip(1)`, `a.out(4)`

**NOTES** The `strip` utility will remove all archive symbol entries from the header. The archive symbol entries must be restored with the `-ts` options of the `ar` command before the archive can be used with the link editor `ld`.

assert.h(3HEAD)

**NAME** assert.h, assert – verify program assertion

**SYNOPSIS** `#include <assert.h>`

**DESCRIPTION** The `<assert.h>` header defines the `assert()` macro. It refers to the macro `NDEBUG` which is not defined in the header. If `NDEBUG` is defined as a macro name before the inclusion of this header, the `assert()` macro is defined simply as:

```
#define assert(ignore) ((void) 0)
```

Otherwise, the macro behaves as described in [assert\(3C\)](#).

The `assert()` macro is redefined according to the current state of `NDEBUG` each time `<assert.h>` is included.

The `assert()` macro is implemented as a macro, not as a function. If the macro definition is suppressed in order to access an actual function, the behavior is undefined.

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** [assert\(3C\)](#), [attributes\(5\)](#), [standards\(5\)](#)

<b>NAME</b>	complex.h, complex – complex arithmetic				
<b>SYNOPSIS</b>	<code>#include &lt;complex.h&gt;</code>				
<b>DESCRIPTION</b>	<p>The <code>&lt;complex.h&gt;</code> header defines the following macros:</p> <p><code>complex</code>           Expands to <code>_Complex</code>.</p> <p><code>_Complex_I</code>       Expands to a constant expression of type <code>const float _Complex</code>, with the value of the imaginary unit (that is, a number <code>i</code> such that <math>i^2=-1</math>).</p> <p><code>imaginary</code>         Expands to <code>_Imaginary</code>.</p> <p><code>_Imaginary_I</code>     Expands to a constant expression of type <code>const float _Imaginary</code> with the value of the imaginary unit.</p> <p><code>I</code>                 Expands to either <code>_Imaginary_I</code> or <code>_Complex_I</code>. If <code>_Imaginary_I</code> is not defined, <code>I</code> expands to <code>_Complex_I</code>.</p> <p>An application can undefine and then, if appropriate, redefine the <code>complex</code>, <code>imaginary</code>, and <code>I</code> macros.</p>				
<b>USAGE</b>	Values are interpreted as radians, not degrees.				
<b>ATTRIBUTES</b>	See <code>attributes(5)</code> for descriptions of the following attributes:				
	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">ATTRIBUTE TYPE</th> <th style="text-align: center;">ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Interface Stability</td> <td>Standard</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard				
<b>SEE ALSO</b>	<code>cabs(3M)</code> , <code>cacos(3M)</code> , <code>cacosh(3M)</code> , <code>carg(3M)</code> , <code>casin(3M)</code> , <code>casinh(3M)</code> , <code>catan(3M)</code> , <code>catanh(3M)</code> , <code>ccos(3M)</code> , <code>ccosh(3M)</code> , <code>cexp(3M)</code> , <code>cimag(3M)</code> , <code>clog(3M)</code> , <code>conj(3M)</code> , <code>cpow(3M)</code> , <code>cproj(3M)</code> , <code>creal(3M)</code> , <code>csin(3M)</code> , <code>csinh(3M)</code> , <code>csqrt(3M)</code> , <code>ctan(3M)</code> , <code>ctanh(3M)</code> , <code>attributes(5)</code> , <code>standards(5)</code>				
<b>NOTES</b>	<p>The choice of <code>I</code> instead of <code>i</code> for the imaginary unit concedes to the widespread use of the identifier <code>i</code> for other purposes. The application can use a different identifier, say <code>j</code>, for the imaginary unit by following the inclusion of the <code>&lt;complex.h&gt;</code> header with:</p> <pre>#undef I #define j _Imaginary_I</pre> <p>An <code>I</code> suffix to designate imaginary constants is not required, as multiplication by <code>I</code> provides a sufficiently convenient and more generally useful notation for imaginary terms. The corresponding real type for the imaginary unit is <code>float</code>, so that use of <code>I</code> for algorithmic or notational convenience does not result in widening types.</p> <p>On systems with imaginary types, the application has the ability to control whether use of the macro <code>I</code> introduces an imaginary type, by explicitly defining <code>I</code> to be <code>_Imaginary_I</code> or <code>_Complex_I</code>.</p>				

## complex.h(3HEAD)

Disallowing imaginary types is useful for some applications intended to run on implementations without support for such types.

The macro `_Imaginary_I` provides a test for whether imaginary types are supported. The `cis()` function ( $\cos(x) + I*\sin(x)$ ) was considered but rejected because its implementation is easy and straightforward, even though some implementations could compute sine and cosine more efficiently in tandem.

**NAME** cpio.h, cpio – cpio archive values

**SYNOPSIS** `#include <cpio.h>`

**DESCRIPTION** Values needed by the `c_mode` field of the `cpio` archive format are described as follows:

Name	Description
C_IRUSR	Read by owner
C_IWUSR	Write by owner
C_IXUSR	Execute by owner
C_IRGRP	Read by group
C_IWGRP	Write by group
C_IXGRP	Execute by group
C_IROTH	Read by others
C_IWOTH	Write by others
C_IXOTH	Execute by others
C_ISUID	Set user ID
C_ISGID	Set group ID
C_ISVTX	On directories, restricted deletion flag
C_ISDIR	Directory
C_ISFIFO	FIFO
C_ISREG	Regular file
C_ISBLK	Block special
C_ISCHR	Character special
C_ISCTG	Reserved
C_ISLNK	Symbolic link
C_ISSOCK	Socket

The header defines the symbolic constant:

```
MAGIC          "070707"
```

<b>NAME</b>	dirent.h, dirent – format of directory entries				
<b>SYNOPSIS</b>	<pre>#include &lt;dirent.h&gt;</pre>				
<b>DESCRIPTION</b>	<p>The internal format of directories is unspecified. The <code>&lt;dirent.h&gt;</code> header defines the following type:</p> <pre>DIR</pre> <p>A type representing a directory stream.</p> <p>The header also defines the structure <code>dirent</code>, which includes the following members:</p> <pre>ino_t d_ino      /* file serial number */ char  d_name[]   /* name of entry */</pre> <p>The type <code>ino_t</code> is defined as described in <code>&lt;sys/types.h&gt;</code>. See <a href="#">types(3HEAD)</a>.</p> <p>The character array <code>d_name</code> is of unspecified size, but the number of bytes preceding the terminating null byte must not exceed <code>{NAME_MAX}</code>.</p>				
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Interface Stability</td> <td>Standard</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard				
<b>SEE ALSO</b>	<a href="#">closedir(3C)</a> , <a href="#">opendir(3C)</a> , <a href="#">readdir(3C)</a> , <a href="#">rewinddir(3C)</a> , <a href="#">seekdir(3C)</a> , <a href="#">telldir(3C)</a> , <a href="#">types.h(3HEAD)</a> , <a href="#">attributes(5)</a> , <a href="#">standards(5)</a>				

errno.h(3HEAD)

- NAME** errno.h, errno – system error numbers
- SYNOPSIS** #include <errno.h>
- DESCRIPTION** The <errno.h> header provides a declaration for `errno` and gives positive values for the symbolic constants listed on the `intro(2)` manual page.
- USAGE** Values for `errno` are required to be distinct positive values rather than non-zero values.
- ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** `intro(2)`, `attributes(5)`, `standards(5)`

<b>NAME</b>	fcntl.h, fcntl – file control options																																								
<b>SYNOPSIS</b>	#include <fcntl.h>																																								
<b>DESCRIPTION</b>	<p>The &lt;fcntl.h&gt; header defines the following requests and arguments for use by the functions <code>fcntl(2)</code>, <code>open(2)</code>, and <code>openat(2)</code>.</p> <p>Values for <i>cmd</i> used by <code>fcntl()</code> (the following values are unique):</p> <table> <tr> <td><code>F_DUPFD</code></td> <td>Duplicate file descriptor.</td> </tr> <tr> <td><code>F_DUP2FD</code></td> <td>Similar to <code>F_DUPFD</code>, but always returns <i>arg</i>.</td> </tr> <tr> <td><code>F_GETFD</code></td> <td>Get file descriptor flags.</td> </tr> <tr> <td><code>F_SETFD</code></td> <td>Set file descriptor flags.</td> </tr> <tr> <td><code>F_GETFL</code></td> <td>Get file status flags.</td> </tr> <tr> <td><code>F_SETFL</code></td> <td>Set file status flags.</td> </tr> <tr> <td><code>F_GETOWN</code></td> <td>Get process or process group ID to receive SIGURG signals.</td> </tr> <tr> <td><code>F_SETOWN</code></td> <td>Set process or process group ID to receive SIGURG signals.</td> </tr> <tr> <td><code>F_FREESP</code></td> <td>Free storage space associated with a section of the ordinary file <i>files</i>.</td> </tr> <tr> <td><code>F_GETLK</code></td> <td>Get record locking information.</td> </tr> <tr> <td><code>F_GETLK64</code></td> <td>Equivalent to <code>F_GETLK</code>, but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.</td> </tr> <tr> <td><code>F_SETLK</code></td> <td>Set record locking information.</td> </tr> <tr> <td><code>F_SETLK64</code></td> <td>Equivalent to <code>F_SETLK</code>, but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.</td> </tr> <tr> <td><code>F_SETLKW</code></td> <td>Set record locking information; wait if blocked.</td> </tr> <tr> <td><code>F_SETLKW64</code></td> <td>Equivalent to <code>F_SETLKW</code>, but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.</td> </tr> <tr> <td><code>F_SHARE</code></td> <td>Set share reservation.</td> </tr> <tr> <td><code>F_UNSHARE</code></td> <td>Remove share reservation.</td> </tr> </table> <p>File descriptor flags used for <code>fcntl()</code>:</p> <table> <tr> <td><code>FD_CLOEXEC</code></td> <td>Close the file descriptor upon execution of an <code>exec</code> function (see <code>exec(2)</code>).</td> </tr> </table> <p>Values for <i>l_type</i> used for record locking with <code>fcntl()</code> (the following values are unique):</p> <table> <tr> <td><code>F_RDLCK</code></td> <td>Shared or read lock.</td> </tr> <tr> <td><code>F_UNLCK</code></td> <td>Unlock.</td> </tr> </table>	<code>F_DUPFD</code>	Duplicate file descriptor.	<code>F_DUP2FD</code>	Similar to <code>F_DUPFD</code> , but always returns <i>arg</i> .	<code>F_GETFD</code>	Get file descriptor flags.	<code>F_SETFD</code>	Set file descriptor flags.	<code>F_GETFL</code>	Get file status flags.	<code>F_SETFL</code>	Set file status flags.	<code>F_GETOWN</code>	Get process or process group ID to receive SIGURG signals.	<code>F_SETOWN</code>	Set process or process group ID to receive SIGURG signals.	<code>F_FREESP</code>	Free storage space associated with a section of the ordinary file <i>files</i> .	<code>F_GETLK</code>	Get record locking information.	<code>F_GETLK64</code>	Equivalent to <code>F_GETLK</code> , but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.	<code>F_SETLK</code>	Set record locking information.	<code>F_SETLK64</code>	Equivalent to <code>F_SETLK</code> , but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.	<code>F_SETLKW</code>	Set record locking information; wait if blocked.	<code>F_SETLKW64</code>	Equivalent to <code>F_SETLKW</code> , but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.	<code>F_SHARE</code>	Set share reservation.	<code>F_UNSHARE</code>	Remove share reservation.	<code>FD_CLOEXEC</code>	Close the file descriptor upon execution of an <code>exec</code> function (see <code>exec(2)</code> ).	<code>F_RDLCK</code>	Shared or read lock.	<code>F_UNLCK</code>	Unlock.
<code>F_DUPFD</code>	Duplicate file descriptor.																																								
<code>F_DUP2FD</code>	Similar to <code>F_DUPFD</code> , but always returns <i>arg</i> .																																								
<code>F_GETFD</code>	Get file descriptor flags.																																								
<code>F_SETFD</code>	Set file descriptor flags.																																								
<code>F_GETFL</code>	Get file status flags.																																								
<code>F_SETFL</code>	Set file status flags.																																								
<code>F_GETOWN</code>	Get process or process group ID to receive SIGURG signals.																																								
<code>F_SETOWN</code>	Set process or process group ID to receive SIGURG signals.																																								
<code>F_FREESP</code>	Free storage space associated with a section of the ordinary file <i>files</i> .																																								
<code>F_GETLK</code>	Get record locking information.																																								
<code>F_GETLK64</code>	Equivalent to <code>F_GETLK</code> , but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.																																								
<code>F_SETLK</code>	Set record locking information.																																								
<code>F_SETLK64</code>	Equivalent to <code>F_SETLK</code> , but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.																																								
<code>F_SETLKW</code>	Set record locking information; wait if blocked.																																								
<code>F_SETLKW64</code>	Equivalent to <code>F_SETLKW</code> , but takes a <code>struct flock64</code> argument rather than a <code>struct flock</code> argument.																																								
<code>F_SHARE</code>	Set share reservation.																																								
<code>F_UNSHARE</code>	Remove share reservation.																																								
<code>FD_CLOEXEC</code>	Close the file descriptor upon execution of an <code>exec</code> function (see <code>exec(2)</code> ).																																								
<code>F_RDLCK</code>	Shared or read lock.																																								
<code>F_UNLCK</code>	Unlock.																																								

## fcntl.h(3HEAD)

F\_WRLCK Exclusive or write lock.

Values for `f_access` used for share reservations with `fcntl()` (the following values are unique):

F\_RDACC Read-only share reservation.

F\_WRACC Write-only share reservation.

F\_RWACC Read and write share reservation.

Values for `f_deny` used for share reservations with `fcntl()` (the following values are unique):

F\_COMPAT Compatibility mode share reservation.

F\_RDDNY Deny other read access share reservations.

F\_WRDNY Deny other write access share reservations.

F\_RWDNY Deny other read or write access share reservations.

F\_NODNY Do not deny other read or write access share reservations.

File creation and assignment flags are used in the *oflag* argument by `open()` and `openat()`. All of these values are bitwise distinct:

O\_CREAT Create file if it does not exist.

O\_EXCL Exclusive use flag.

O\_NOCTTY Do not assign controlling tty.

O\_TRUNC Truncate flag.

O\_XATTR When opening a file, this flag affects the way in which relative paths are resolved by `open()` and `openat()`. With this flag set, the *path* argument is resolved as an extended attribute reference on either the current working directory (if `open()`) or of the file referenced by the file descriptor argument of `openat()`.

File status flags used for `fcntl()`, `open()`, and `open()`:

O\_APPEND Set append mode.

O\_NDELAY Non-blocking mode.

O\_NONBLOCK Non-blocking mode (POSIX; see `standards(5)`).

O\_DSYNC Write I/O operations on the file descriptor complete as defined by synchronized I/O data integrity completion.

O\_RSYNC Read I/O operations on the file descriptor complete at the same level of integrity as specified by the `O_DSYNC` and `O_SYNC` flags. If both `O_DSYNC` and `O_RSYNC` are set in *oflag*, all I/O operations on the file descriptor complete as defined by synchronized I/O data

integrity completion. If both `O_SYNC` and `O_RSYNC` are set in *oflag*, all I/O operations on the file descriptor complete as defined by synchronized I/O file integrity completion.

`O_SYNC` When opening a regular file, this flag affects subsequent writes. If set, each `write(2)` will wait for both the file data and file status to be physically updated. Write I/O operations on the file descriptor complete as defined by synchronized I/O file integrity completion.

Mask for use with file access modes:

`O_ACCMODE` Mask for file access modes.

File access modes used for `fcntl()`, `open()`, and `openat()`:

`O_RDONLY` Open for reading only.

`O_RDWR` Open for reading and writing.

`O_WRONLY` Open for writing only.

The following constants are used by system calls capable of resolving paths relative to a provided open file descriptor:

`AT_FDCWD` Special value to pass in place of a file descriptor to inform the called routine that relative path arguments should be resolved from the current working directory.

`AT_SYMLINK_NOFOLLOW` Flag passed to `fstatat(2)` and `fchownat(2)` to change the behavior of these functions when they are given a file as an argument that is a symbolic link. In this case the functions operate on the symbolic link file rather than the file the link references.

`AT_REMOVEDIR` Flag passed to `unlinkat(2)` to tell it to assume that its path argument refers to a directory and to attempt to remove this directory.

The `flock` structure describes a file lock. It includes the following members:

```
short  l_type; /* Type of lock */
short  l_whence; /* Flag for starting offset */
off_t  l_start; /* Relative offset in bytes */
off_t  l_len; /* Size; if 0 then until EOF */
long   l_sysid; /* Returned with F_GETLK */
pid_t  l_pid; /* Returned with F_GETLK */
```

The structure `fshare` describes a file share reservation. It includes the following members:

```
short  f_access; /* Type of reservation */
short  f_deny; /* Type of reservations to deny */
long   f_id; /* Process unique identifier */
```

fcntl.h(3HEAD)

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** `creat(2)`, `exec(2)`, `fcntl(2)`, `open(2)`, `fdatasync(3RT)`, `fsync(3C)`, `fsattr(5)`, `attributes(5)`, `standards(5)`

**NOTES** Data is successfully transferred for a write operation to a regular file when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

Data is successfully transferred for a read operation when an image of the data on the physical storage medium is available to the requesting process.

Synchronized I/O data integrity completion (see `fdatasync(3RT)`):

- For reads, the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests will be successfully transferred prior to reading the data.
- For writes, the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred, and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

Synchronized I/O file integrity completion (see `fsync(3C)`):

- Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) will be successfully transferred prior to returning to the calling process.

<b>NAME</b>	fenv.h, fenv – floating-point environment				
<b>SYNOPSIS</b>	#include <fenv.h>				
<b>DESCRIPTION</b>	<p>The &lt;fenv.h&gt; header defines the following data types through typedef:</p> <table border="0"> <tr> <td style="vertical-align: top; padding-right: 20px;">fenv_t</td> <td>Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.</td> </tr> <tr> <td style="vertical-align: top; padding-right: 20px;">fexcept_t</td> <td>Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value can be set by the user to affect the subsequent behavior of floating-point arithmetic.</td> </tr> </table> <p>The &lt;fenv.h&gt; header defines the following constants if and only if the implementation supports the floating-point exception by means of the floating-point functions <code>feclearexcept()</code>, <code>fegetexceptflag()</code>, <code>feraiseexcept()</code>, <code>fesetexceptflag()</code>, and <code>fetestexcept()</code>. Each expands to an integer constant expression with values such that bitwise-inclusive ORs of all combinations of the constants result in distinct values.</p> <pre>FE_DIVBYZERO FE_INEXACT FE_INVALID FE_OVERFLOW FE_UNDERFLOW</pre> <p>The &lt;fenv.h&gt; header defines the following constant, which is simply the bitwise-inclusive OR of all floating-point exception constants defined above:</p> <pre>FE_ALL_EXCEPT</pre> <p>The &lt;fenv.h&gt; header defines the following constants. Each expands to an integer constant expression whose values are distinct non-negative values.</p> <pre>FE_DOWNWARD FE_TONEAREST FE_TOWARDZERO FE_UPWARD</pre> <p>The &lt;fenv.h&gt; header defines the following constant, which represents the default floating-point environment (that is, the one installed at program startup) and has type pointer to const-qualified <code>fenv_t</code>. It can be used as an argument to the functions within the &lt;fenv.h&gt; header that manage the floating-point environment.</p> <pre>FE_DFL_ENV</pre>	fenv_t	Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.	fexcept_t	Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value can be set by the user to affect the subsequent behavior of floating-point arithmetic.
fenv_t	Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.				
fexcept_t	Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value can be set by the user to affect the subsequent behavior of floating-point arithmetic.				

The `FENV_ACCESS` pragma provides a means to inform the implementation when an application might access the floating-point environment to test floating-point status flags or run under non-default floating-point control modes. The pragma occurs either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another `FENV_ACCESS` pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another `FENV_ACCESS` pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined.

If part of an application tests floating-point status flags, sets floating-point control modes, or runs under non-default mode settings, but was translated with the state for the `FENV_ACCESS` pragma off, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined. (When execution passes from a part of the application translated with `FENV_ACCESS` off to a part translated with `FENV_ACCESS` on, the state of the floating-point status flags is unspecified and the floating-point control modes have their default settings.)

**USAGE**

This header is designed to support the floating-point exception status flags and directed-rounding control modes required by the IEC 60559: 1989 standard, and other similar floating-point state information. Also, it is designed to facilitate code portability among all systems. Certain application programming conventions support the intended model of use for the floating-point environment:

- A function call does not alter its caller's floating-point control modes, clear its caller's floating-point status flags, or depend on the state of its caller's floating-point status flags unless the function is so documented.
- A function call is assumed to require default floating-point control modes, unless its documentation promises otherwise.
- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros might expand to constants corresponding to the values of `FLT_ROUNDS`, they are not required to do so. For example:

```
#include <fenv.h>
void f(double x)
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
    void h(double);
    /* ... */
}
```

```

    g(x + 1);
    h(x + 1);
    /* ... */
}

```

If the function `g()` might depend on status flags set as a side effect of the first `x+1`, or if the second `x+1` might depend on control modes set as a side effect of the call to function `g()`, then the application must contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

## float.h(3HEAD)

<b>NAME</b>	float.h, float – floating types																				
<b>SYNOPSIS</b>	<pre>#include &lt;float.h&gt;</pre>																				
<b>DESCRIPTION</b>	<p>The characteristics of floating types are defined in terms of a model that describes a representation of floating-point numbers and values that provide information about an implementation's floating-point arithmetic.</p> <p>The following parameters are used to define the model for each floating-point type:</p> <table><tr><td><math>s</math></td><td>sign (<math>\pm 1</math>)</td></tr><tr><td><math>b</math></td><td>base or radix of exponent representation (an integer <math>&gt; 1</math>)</td></tr><tr><td><math>e</math></td><td>exponent (an integer between a minimum <math>e_{\min}</math> and a maximum <math>e_{\max}</math>)</td></tr><tr><td><math>p</math></td><td>precision (the number of base-<math>b</math> digits in the significand)</td></tr><tr><td><math>f_k</math></td><td>non-negative integers less than <math>b</math> (the significand digits)</td></tr></table> <p>In addition to normalized floating-point numbers (<math>f_1 &gt; 0</math> if <math>x \neq 0</math>), floating types might be able to contain other kinds of floating-point numbers, such as subnormal floating-point numbers (<math>x \neq 0</math>, <math>e = e_{\min}</math>, <math>f_1 = 0</math>) and unnormalized floating-point numbers (<math>x \neq 0</math>, <math>e = e_{\min}</math>, <math>f_1 = 0</math>), and values that are not floating-point numbers, such as infinities and NaNs. A <i>NaN</i> is an encoding signifying Not-a-Number. A <i>quiet NaN</i> propagates through almost every arithmetic operation without raising a floating-point exception; a <i>signaling NaN</i> generally raises a floating-point exception when occurring as an arithmetic operand.</p> <p>The accuracy of the library functions in <a href="#">math.h(3HEAD)</a> and <a href="#">complex.h(3HEAD)</a> that return floating-point results is defined on the <a href="#">libm(3LIB)</a> manual page.</p> <p>All integer values in the <code>&lt;float.h&gt;</code> header, except <code>FLT_ROUNDS</code>, are constant expressions suitable for use in <code>#if</code> preprocessing directives; all floating values are constant expressions. All except <code>DECIMAL_DIG</code>, <code>FLT_EVAL_METHOD</code>, <code>FLT_RADIX</code>, and <code>FLT_ROUNDS</code> have separate names for all three floating-point types. The floating-point model representation is provided for all values except <code>FLT_EVAL_METHOD</code> and <code>FLT_ROUNDS</code>.</p> <p>The rounding mode for floating-point addition is characterized by the value of <code>FLT_ROUNDS</code>:</p> <table><tr><td>-1</td><td>Indeterminable.</td></tr><tr><td>0</td><td>Toward zero.</td></tr><tr><td>1</td><td>To nearest.</td></tr><tr><td>2</td><td>Toward positive infinity.</td></tr><tr><td>3</td><td>Toward negative infinity.</td></tr></table>	$s$	sign ( $\pm 1$ )	$b$	base or radix of exponent representation (an integer $> 1$ )	$e$	exponent (an integer between a minimum $e_{\min}$ and a maximum $e_{\max}$ )	$p$	precision (the number of base- $b$ digits in the significand)	$f_k$	non-negative integers less than $b$ (the significand digits)	-1	Indeterminable.	0	Toward zero.	1	To nearest.	2	Toward positive infinity.	3	Toward negative infinity.
$s$	sign ( $\pm 1$ )																				
$b$	base or radix of exponent representation (an integer $> 1$ )																				
$e$	exponent (an integer between a minimum $e_{\min}$ and a maximum $e_{\max}$ )																				
$p$	precision (the number of base- $b$ digits in the significand)																				
$f_k$	non-negative integers less than $b$ (the significand digits)																				
-1	Indeterminable.																				
0	Toward zero.																				
1	To nearest.																				
2	Toward positive infinity.																				
3	Toward negative infinity.																				

The values of operations with floating operands and values subject to the usual arithmetic conversions and of floating constants are evaluated to a format whose range and precision might be greater than required by the type. The use of evaluation formats is characterized by the architecture-dependent value of `FLT_EVAL_METHOD`:

- 1 Indeterminable.
- 0 Evaluate all operations and constants just to the range and precision of the type.
- 1 Evaluate operations and constants of type float and double to the range and precision of the double type; evaluate long double operations and constants to the range and precision of the long double type.
- 2 Evaluate all operations and constants to the range and precision of the long double type.

The values given in the following list are defined as constants.

- Radix of exponent representation,  $b$ .

`FLT_RADIX`

- Number of base-`FLT_RADIX` digits in the floating-point significand,  $p$ .

`FLT_MANT_DIG`  
`DBL_MANT_DIG`  
`LDBL_MANT_DIG`

- Number of decimal digits,  $n$ , such that any floating-point number in the widest supported floating type with  $p_{\max}$  radix  $b$  digits can be rounded to a floating-point number with  $n$  decimal digits and back again without change to the value.

`DECIMAL_DIG`

- Number of decimal digits,  $q$ , such that any floating-point number with  $q$  decimal digits can be rounded into a floating-point number with  $p$  radix  $b$  digits and back again without change to the  $q$  decimal digits.

`FLT_DIG`  
`DBL_DIG`  
`LDBL_DIG`

- Minimum negative integer such that `FLT_RADIX` raised to that power minus 1 is a normalized floating-point number,  $e_{\min}$ .

`FLT_MIN_EXP`  
`DBL_MIN_EXP`  
`LDBL_MIN_EXP`

- Minimum negative integer such that 10 raised to that power is in the range of normalized floating-point numbers.

`FLT_MIN_10_EXP`  
`DBL_MIN_10_EXP`  
`LDBL_MIN_10_EXP`

## float.h(3HEAD)

- Maximum integer such that `FLT_RADIX` raised to that power minus 1 is a representable finite floating-point number,  $e_{\max}$ .

```
FLT_MAX_EXP
DBL_MAX_EXP
LDBL_MAX_EXP
```

- Maximum integer such that 10 raised to that power is in the range of representable finite floating-point numbers.

```
FLT_MAX_10_EXP
DBL_MAX_10_EXP
LDBL_MAX_10_EXP
```

The values given in the following list are defined as constant expressions with values that are greater than or equal to those shown:

- Maximum representable finite floating-point number.

```
FLT_MAX
DBL_MAX
LDBL_MAX
```

The values given in the following list are defined as constant expressions with implementation-defined (positive) values that are less than or equal to those shown:

- The difference between 1 and the least value greater than 1 that is representable in the given floating-point type,  $b^{1-p}$ .

```
FLT_EPSILON
DBL_EPSILON
LDBL_EPSILON
```

- Minimum normalized positive floating-point number,  $b^{e_{\min}-1}$ .

```
FLT_MIN
DBL_MIN
LDBL_MIN
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** `complex.h(3HEAD)`, `math.h(3HEAD)`, `attributes(5)`, `standards(5)`

<b>NAME</b>	floatingpoint.h, floatingpoint – IEEE floating point definitions	
<b>SYNOPSIS</b>	#include <floatingpoint.h>	
<b>DESCRIPTION</b>	This file defines constants, types, and functions used to implement standard floating point according to ANSI/IEEE Std 754-1985. The functions are implemented in <code>libc</code> . The included header file <code>&lt;sys/ieee_fp.h&gt;</code> defines certain types of interest to the kernel.	
<b>IEEE Rounding Modes</b>	<code>fp_direction_type</code>	The type of the IEEE rounding direction mode. Note: the order of enumeration varies according to hardware.
	<code>fp_precision_type</code>	The type of the IEEE rounding precision mode, which only applies on systems that support extended precision such as machines based on the Intel 80387 FPU or the 80486. SIGFPE handling:
	<code>sigfpe_code_type</code>	The type of a SIGFPE code.
	<code>sigfpe_handler_type</code>	The type of a user-definable SIGFPE exception handler called to handle a particular SIGFPE code.
	<code>SIGFPE_DEFAULT</code>	A macro indicating the default SIGFPE exception handling, namely to perform the exception handling specified by the user, if any, and otherwise to dump core using <code>abort(3C)</code> .
	<code>SIGFPE_IGNORE</code>	A macro indicating an alternate SIGFPE exception handling, namely to ignore and continue execution.
	<code>SIGFPE_ABORT</code>	A macro indicating an alternate SIGFPE exception handling, namely to abort with a core dump.
<b>IEEE Exception Handling</b>	<code>N_IEEE_EXCEPTION</code>	The number of distinct IEEE floating-point exceptions.
	<code>fp_exception_type</code>	The type of the <code>N_IEEE_EXCEPTION</code> exceptions. Each exception is given a bit number.
	<code>fp_exception_field_type</code>	The type intended to hold at least <code>N_IEEE_EXCEPTION</code> bits corresponding to the IEEE exceptions numbered by <code>fp_exception_type</code> . Thus <code>fp_inexact</code> corresponds to the least significant bit and <code>fp_invalid</code> to the fifth least significant bit. Note: some operations may set more

## floatingpoint.h(3HEAD)

		than one exception.
<b>IEEE Formats and Classification</b>	single; extended; quadruple	Definitions of IEEE formats.
	fp_class_type	An enumeration of the various classes of IEEE values and symbols.
<b>IEEE Base Conversion</b>	The functions described under <code>floating_to_decimal(3C)</code> and <code>decimal_to_floating(3C)</code> satisfy not only the IEEE Standard, but also the stricter requirements of correct rounding for all arguments.	
	DECIMAL_STRING_LENGTH	The length of a <code>decimal_string</code> .
	decimal_string	The digit buffer in a <code>decimal_record</code> .
	decimal_record	The canonical form for representing an unpacked decimal floating-point number.
	decimal_form	The type used to specify fixed or floating binary to decimal conversion.
	decimal_mode	A struct that contains specifications for conversion between binary and decimal.
	decimal_string_form	An enumeration of possible valid character strings representing floating-point numbers, infinities, or NaNs.
	<b>FILES</b>	/usr/include/sys/ieee.h
<b>SEE ALSO</b>	abort(3C), decimal_to_floating(3C), econvert(3C), floating_to_decimal(3C), sigfpe(3C), string_to_decimal(3C), strtod(3C)	

**NAME** | `fmtmsg.h`, `fmtmsg` – message display structures

**SYNOPSIS** | `#include <fmtmsg.h>`

**DESCRIPTION** | The `<fmtmsg.h>` header defines the following macros, which expand to constant integer expressions:

<code>MM_HARD</code>	Source of the condition is hardware.
<code>MM_SOFT</code>	Source of the condition is software.
<code>MM_FIRM</code>	Source of the condition is firmware.
<code>MM_APPL</code>	Condition detected by application.
<code>MM_UTIL</code>	Condition detected by utility.
<code>MM_OPSYS</code>	Condition detected by operating system.
<code>MM_RECOVER</code>	Recoverable error.
<code>MM_NRECOV</code>	Non-recoverable error.
<code>MM_HALT</code>	Error causing application to halt.
<code>MM_ERROR</code>	Application has encountered a non-fatal fault.
<code>MM_WARNING</code>	Application has detected unusual non-error condition.
<code>MM_INFO</code>	Informative message.
<code>MM_NOSEV</code>	No severity level provided for the message.
<code>MM_PRINT</code>	Display message on standard error.
<code>MM_CONSOLE</code>	Display message on system console.

The table below indicates the null values and identifiers for `fmtmsg(3C)` arguments. The `<fmtmsg.h>` header defines the macros in the Identifier column, which expand to constant expressions that expand to expressions of the type indicated in the Type column:

Argument	Type	Null-Value	Identifier
<i>label</i>	<code>char*</code>	<code>(char*) NULL</code>	<code>MM_NULLLBL</code>
<i>severity</i>	<code>int</code>	<code>0</code>	<code>MM_NULLSEV</code>
<i>class</i>	<code>long</code>	<code>0L</code>	<code>MM_NULLMC</code>
<i>text</i>	<code>char*</code>	<code>(char*) NULL</code>	<code>MM_NULLTXT</code>
<i>action</i>	<code>char*</code>	<code>(char*) NULL</code>	<code>MM_NULLACT</code>
<i>tag</i>	<code>char*</code>	<code>(char*) NULL</code>	<code>MM_NULLTAG</code>

## fmtmsg.h(3HEAD)

The `<fmtmsg.h>` header also defines the following macros for use as return values for `fmtmsg()`:

`MM_OK`                   The function succeeded.  
`MM_NOTOK`                The function failed completely.  
`MM_NOMSG`                The function was unable to generate a message on standard error, but otherwise succeeded.  
`MM_NOCON`                The function was unable to generate a console message, but otherwise succeeded.

## grp.h(3HEAD)

**NAME** grp.h, grp – group structure

**SYNOPSIS** #include <grp.h>

**DESCRIPTION** The <grp.h> header declares the structure group, which includes the following members:

```
char *gr_name      /* name of the group */
gid_t gr_gid       /* numerical group ID */
char **gr_mem      /* pointer to a null-terminated array of character */
                  /* pointers to member names */
```

The gid\_t type is defined as described in <sys/types.h> (see [types\(3HEAD\)](#)).

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

<b>NAME</b>	iconv.h, iconv – codeset conversion facility				
<b>SYNOPSIS</b>	<code>#include &lt;iconv.h&gt;</code>				
<b>DESCRIPTION</b>	The <code>&lt;iconv.h&gt;</code> header defines the following type: <code>iconv_t</code> Identifies the conversion from one codeset to another.				
<b>ATTRIBUTES</b>	See <code>attributes(5)</code> for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Interface Stability</td> <td>Standard</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard				
<b>SEE ALSO</b>	<code>iconv(3C)</code> , <code>iconv_close(3C)</code> , <code>iconv_open(3C)</code> , <code>attributes(5)</code> , <code>standards(5)</code>				

## if.h(3HEAD)

<b>NAME</b>	if.h, if – sockets local interfaces				
<b>SYNOPSIS</b>	<pre>#include &lt;net/if.h&gt;</pre>				
<b>DESCRIPTION</b>	<p>The &lt;net/if.h&gt; header defines the <code>if_nameindex</code> structure, which includes the following members:</p> <pre>unsigned if_index    /* numeric index of the interface */ char     *if_name    /* null-terminated name of the interface */</pre> <p>The &lt;net/if.h&gt; header defines the following macro for the length of a buffer containing an interface name (including the terminating null character):</p> <pre>IF_NAMESIZE    interface name length</pre>				
<b>ATTRIBUTES</b>	See <code>attributes(5)</code> for descriptions of the following attributes:				
	<table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Interface Stability</td><td>Standard</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard				
<b>SEE ALSO</b>	<code>if_nametoindex(3XNET)</code> , <code>attributes(5)</code> , <code>standards(5)</code>				

<b>NAME</b>	inet.h, inet – definitions for internet operations				
<b>SYNOPSIS</b>	<pre>#include &lt;arpa/inet.h&gt;</pre>				
<b>DESCRIPTION</b>	<p>The <code>&lt;arpa/inet.h&gt;</code> header defines the type <code>in_port_t</code>, the type <code>in_addr_t</code>, and the <code>in_addr</code> structure, as described in <a href="#">in.h(3HEAD)</a>.</p> <p>Inclusion of the <code>&lt;arpa/inet.h&gt;</code> header may also make visible all symbols from <a href="#">in.h(3HEAD)</a>.</p> <p>The following are declared as functions, and may also be defined as macros:</p> <pre>in_addr_t      inet_addr(const char *); in_addr_t      inet_lnaof(struct in_addr); struct in_addr inet_makeaddr(in_addr_t, in_addr_t); in_addr_t      inet_netof(struct in_addr); in_addr_t      inet_network(const char *); char           *inet_ntoa(struct in_addr);</pre>				
<b>Default</b>	<p>For applications that do not require standard-conforming behavior (those that use the socket interfaces described in section 3N of the reference manual; see <a href="#">Intro(3)</a> and <a href="#">standards(5)</a>), the following may be declared as functions, or defined as macros, or both:</p> <pre>uint32_t      htonl(uint32_t); uint16_t      htons(uint16_t); uint32_t      ntohl(uint32_t); uint16_t      ntohs(uint16_t);</pre>				
<b>Standard conforming</b>	<p>For applications that require standard-conforming behavior (those that use the socket interfaces described in section 3XN of the reference manual; see <a href="#">Intro(3)</a> and <a href="#">standards(5)</a>), the following may be declared as functions, or defined as macros, or both:</p> <pre>in_addr_t      htonl(in_addr_t); in_port_t      htons(in_port_t); in_addr_t      ntohl(in_addr_t); in_port_t      ntohs(in_port_t);</pre>				
<b>ATTRIBUTES</b>	<p>See <a href="#">attributes(5)</a> for descriptions of the following attributes:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">ATTRIBUTE TYPE</th> <th style="text-align: center;">ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Interface Stability</td> <td>Standard</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard				
<b>SEE ALSO</b>	<a href="#">Intro(3)</a> , <a href="#">htonl(3SOCKET)</a> , <a href="#">htonl(3XNET)</a> , <a href="#">inet_addr(3SOCKET)</a> , <a href="#">inet_addr(3XNET)</a> , <a href="#">in.h(3HEAD)</a> , <a href="#">attributes(5)</a> , <a href="#">standards(5)</a>				

## in.h(3HEAD)

<b>NAME</b>	in.h, in – Internet Protocol family
<b>SYNOPSIS</b>	<pre>#include &lt;netinet/in.h&gt;</pre>
<b>DESCRIPTION</b>	<p>The <code>&lt;netinet/in.h&gt;</code> header defines the following types through <code>typedef</code>:</p> <p><code>in_port_t</code>      An unsigned integral type of exactly 16 bits.</p> <p><code>in_addr_t</code>      An unsigned integral type of exactly 32 bits. The <code>&lt;netinet/in.h&gt;</code> header defines the <code>in_addr</code> structure that includes the following member:</p> <p>The <code>&lt;netinet/in.h&gt;</code> header defines the <code>in_addr</code> structure that includes the following member:</p> <pre>in_addr_t      s_addr</pre> <p>The <code>&lt;netinet/in.h&gt;</code> header defines the type <code>sa_family_t</code> as described in <a href="#">socket.h(3HEAD)</a>.</p> <p>The <code>&lt;netinet/in.h&gt;</code> header defines the following macros for use as values of the <code>level</code> argument of <code>getsockopt()</code> and <code>setsockopt()</code>:</p> <p><code>IPPROTO_IP</code>      Dummy for IP</p> <p><code>IPPROTO_ICMP</code>    Control message protocol</p> <p><code>IPPROTO_TCP</code>     TCP</p> <p><code>IPPROTO_UDP</code>     User datagram protocol The <code>&lt;netinet/in.h&gt;</code> header defines the following macros for use as destination addresses for <code>connect()</code>, <code>sendmsg()</code>, and <code>sendto()</code>:</p> <p><code>INADDR_ANY</code>      Local host address</p> <p><code>INADDR_BROADCAST</code>    Broadcast address</p> <p>The <code>&lt;netinet/in.h&gt;</code> header defines the <code>sockaddr_in</code> structure that is used to store addresses for the Internet protocol family. Values of this type must be cast to <code>struct sockaddr</code> for use with the socket interfaces.</p>
<b>Default</b>	<p>For applications that do not require standard-conforming behavior (those that use the socket interfaces described in section (3SOCKET) of the reference manual; see <a href="#">Intro(3)</a> and <a href="#">standards(5)</a>), the <code>&lt;netinet/in.h&gt;</code> header defines the <code>sockaddr_in</code> structure that includes the following members:</p> <pre>sa_family_t      sin_family in_port_t        sin_port struct in_addr   sin_addr char             sin_zero[8]</pre>

**Standard conforming**

For applications that require standard-conforming behavior (those that use the socket interfaces described in section (3XNET) of the reference manual; see [Intro\(3\)](#) and [standards\(5\)](#)), the `<netinet/in.h>` header defines the `sockaddr_in` structure that includes the following members:

```
sa_family_t    sin_family
in_port_t     sin_port
struct in_addr sin_addr
unsigned char  sin_zero[8]
```

**ATTRIBUTES**

See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO**

[Intro\(3\)](#), [connect\(3SOCKET\)](#), [connect\(3XNET\)](#), [getsockopt\(3SOCKET\)](#), [getsockopt\(3XNET\)](#), [sendmsg\(3SOCKET\)](#), [sendmsg\(3XNET\)](#), [sendto\(3SOCKET\)](#), [sendto\(3XNET\)](#), [setsockopt\(3SOCKET\)](#), [setsockopt\(3XNET\)](#), [socket.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

## inttypes.h(3HEAD)

<b>NAME</b>	inttypes.h, inttypes – fixed size integer types
<b>SYNOPSIS</b>	<pre>#include &lt;inttypes.h&gt;</pre>
<b>DESCRIPTION</b>	<p>The <code>&lt;inttypes.h&gt;</code> header includes the <code>&lt;stdint.h&gt;</code> header.</p> <p>The <code>&lt;inttypes.h&gt;</code> header includes a definition of the following type:</p> <pre>imaxdiv_t      structure type that is the type of the value returned by the                 imaxdiv() function.</pre> <p>The following macros are defined. Each expands to a character string literal containing a conversion specifier, possibly modified by a length modifier, suitable for use within the format argument of a formatted input/output function when converting the corresponding integer type. These macros have the general form of <code>PRI</code> (character string literals for the <code>fprintf()</code> and <code>fwprintf()</code> family of functions) or <code>SCN</code> (character string literals for the <code>fscanf()</code> and <code>fwscanf()</code> family of functions), followed by the conversion specifier, followed by a name corresponding to a similar type name in <code>&lt;stdint.h&gt;</code>. In these names, <i>N</i> represents the width of the type as described in <code>&lt;stdint.h&gt;</code>. For example, <code>PRIdFAST32</code> can be used in a format string to print the value of an integer of type <code>int_fast32_t</code>.</p> <p>The <code>fprintf()</code> macros for signed integers are:</p> <pre>PRIdN  PRIdLEASTN  PRIdFASTN  PRIdMAX  PRIdPTR PRIiN  PRIiLEASTN  PRIiFASTN  PRIiMAX  PRIiPTR</pre> <p>The <code>fprintf()</code> macros for unsigned integers are:</p> <pre>PRIoN  PRIoLEASTN  PRIoFASTN  PRIoMAX  PRIoPTR PRIuN  PRIuLEASTN  PRIuFASTN  PRIuMAX  PRIuPTR PRIxN  PRIxLEASTN  PRIxFASTN  PRIxMAX  PRIxPTR PRIxN  PRIxLEASTN  PRIxFASTN  PRIxMAX  PRIxPTR</pre> <p>The <code>fscanf()</code> macros for signed integers are:</p> <pre>SCNdN  SCNdLEASTN  SCNdFASTN  SCNdMAX  SCNdPTR SCNiN  SCNiLEASTN  SCNiFASTN  SCNiMAX  SCNiPTR</pre> <p>The <code>fscanf()</code> macros for unsigned integers are:</p> <pre>SCNoN  SCNoLEASTN  SCNoFASTN  SCNoMAX  SCNoPTR SCNuN  SCNuLEASTN  SCNuFASTN  SCNuMAX  SCNuPTR SCNxN  SCNxLEASTN  SCNxFASTN  SCNxMAX  SCNxPTR</pre> <p>For each type that the implementation provides in <code>&lt;stdint.h&gt;</code>, the corresponding <code>fprintf()</code> and <code>fwprintf()</code> macros must be defined. The corresponding <code>fscanf()</code> and <code>fwscanf()</code> macros must be defined as well, unless the implementation does not have a suitable modifier for the type.</p>

**USAGE** The purpose of `<inttypes.h>` is to provide a set of integer types whose definitions are consistent across machines and independent of operating systems and other implementation idiosyncrasies. It defines, with a `typedef`, integer types of various sizes. Implementations are free to `typedef` them as ISO C standard integer types or extensions that they support. Consistent use of this header greatly increases the portability of applications across platforms.

**EXAMPLES** **EXAMPLE 1** Use of Macro

The following code uses one of the macros available through `<inttypes.h>`.

```
#include <inttypes.h>
#include <wchar.h>
int main(void)
{
    uintmax_t i = UINTMAX_MAX; // This type always exists.
    wprintf("The largest integer value is %020"
           PRIxMAX, "\n", i);
    return 0;
}
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** `imaxdiv(3C)`, `attributes(5)`, `standards(5)`

## ipc.h(3HEAD)

<b>NAME</b>	ipc.h, ipc – XSI interprocess communication access structure														
<b>SYNOPSIS</b>	<pre>#include &lt;sys/ipc.h&gt;</pre>														
<b>DESCRIPTION</b>	<p>The <code>&lt;sys/ipc.h&gt;</code> header is used by three mechanisms for interprocess communication (IPC): messages, semaphores, and shared memory. All use a common structure type, <code>ipc_perm</code>, to pass information used in determining permission to perform an IPC operation.</p> <p>The <code>ipc_perm</code> structure contains the following members:</p> <pre>uid_t  uid      /* owner's user ID */ gid_t  gid      /* owner's group ID */ uid_t  cuid     /* creator's user ID */ gid_t  cgid     /* creator's group ID */ mode_t mode     /* read/write permission</pre> <p>The <code>uid_t</code>, <code>gid_t</code>, <code>mode_t</code>, and <code>key_t</code> types are defined as described in <code>&lt;sys/types.h&gt;</code>. See <a href="#">types.h(3HEAD)</a>.</p> <p>Definitions are provided for the constants listed below.</p> <p>Mode bits:</p> <table><tr><td>IPC_CREAT</td><td>Create entry if key does not exist.</td></tr><tr><td>IPC_EXCL</td><td>Fail if key exists.</td></tr><tr><td>IPC_NOWAIT</td><td>Error if request must wait.</td></tr></table> <p>Keys:</p> <table><tr><td>IPC_PRIVATE</td><td>Private key.</td></tr></table> <p>Control commands:</p> <table><tr><td>IPC_RMID</td><td>Remove identifier.</td></tr><tr><td>IPC_SET</td><td>Set options.</td></tr><tr><td>IPC_STAT</td><td>Get options.</td></tr></table>	IPC_CREAT	Create entry if key does not exist.	IPC_EXCL	Fail if key exists.	IPC_NOWAIT	Error if request must wait.	IPC_PRIVATE	Private key.	IPC_RMID	Remove identifier.	IPC_SET	Set options.	IPC_STAT	Get options.
IPC_CREAT	Create entry if key does not exist.														
IPC_EXCL	Fail if key exists.														
IPC_NOWAIT	Error if request must wait.														
IPC_PRIVATE	Private key.														
IPC_RMID	Remove identifier.														
IPC_SET	Set options.														
IPC_STAT	Get options.														
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:														
	<table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Interface Stability</td><td>Standard</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard										
ATTRIBUTE TYPE	ATTRIBUTE VALUE

Interface Stability	Standard

**SEE ALSO** `attributes(5)`, `standards(5)`

## langinfo.h(3HEAD)

**NAME** langinfo.h, langinfo – language information constants

**SYNOPSIS** #include <langinfo.h>

**DESCRIPTION** The <langinfo.h> header contains the constants used to identify items of langinfo data (see nl\_langinfo(3C)). The type of the constant, nl\_item, is defined as described in <nl\_types.h>.

The following constants are defined. The entries under Category indicate in which setlocale(3C) category each item is defined.

Constant	Category	Meaning
CODESET	LC_CTYPE	codeset name
D_T_FMT	LC_TIME	string for formatting date and time
D_FMT	LC_TIME	date format string
T_FMT	LC_TIME	time format string
T_FMT_AMPM	LC_TIME	a.m. or p.m. time format string
AM_STR	LC_TIME	ante-meridiem affix
PM_STR	LC_TIME	post-meridiem affix
DAY_1	LC_TIME	name of the first day of the week (for example, Sunday)
DAY_2	LC_TIME	name of the second day of the week (for example, Monday)
DAY_3	LC_TIME	name of the third day of the week (for example, Tuesday)
DAY_4	LC_TIME	name of the fourth day of the week (for example, Wednesday)
DAY_5	LC_TIME	name of the fifth day of the week (for example, Thursday)
DAY_6	LC_TIME	name of the sixth day of the week (for example, Friday)
DAY_7	LC_TIME	name of the seventh day of the week (for example, Saturday)
ABDAY_1	LC_TIME	abbreviated name of the first day of the week
ABDAY_2	LC_TIME	abbreviated name of the second day of the week

<b>Constant</b>	<b>Category</b>	<b>Meaning</b>
ABDAY_3	LC_TIME	abbreviated name of the third day of the week
ABDAY_4	LC_TIME	abbreviated name of the fourth day of the week
ABDAY_5	LC_TIME	abbreviated name of the fifth day of the week
ABDAY_6	LC_TIME	abbreviated name of the seventh day of the week
ABDAY_7	LC_TIME	abbreviated name of the seventh day of the week
MON_1	LC_TIME	name of the first month of the year
MON_2	LC_TIME	name of the second month
MON_3	LC_TIME	name of the third month
MON_4	LC_TIME	name of the fourth month
MON_5	LC_TIME	name of the fifth month
MON_6	LC_TIME	name of the sixth month
MON_7	LC_TIME	name of the seventh month
MON_8	LC_TIME	name of the eighth month
MON_9	LC_TIME	name of the ninth month
MON_10	LC_TIME	name of the tenth month
MON_11	LC_TIME	name of the eleventh month
MON_12	LC_TIME	name of the twelfth month
ABMON_1	LC_TIME	abbreviated name of the first month
ABMON_2	LC_TIME	abbreviated name of the second month
ABMON_3	LC_TIME	abbreviated name of the third month
ABMON_4	LC_TIME	abbreviated name of the fourth month
ABMON_5	LC_TIME	abbreviated name of the fifth month
ABMON_6	LC_TIME	abbreviated name of the sixth month
ABMON_7	LC_TIME	abbreviated name of the seventh month
ABMON_8	LC_TIME	abbreviated name of the eighth month
ABMON_9	LC_TIME	abbreviated name of the ninth month

langinfo.h(3HEAD)

Constant	Category	Meaning
ABMON_10	LC_TIME	abbreviated name of the tenth month
ABMON_11	LC_TIME	abbreviated name of the eleventh month
ABMON_12	LC_TIME	abbreviated name of the twelfth month
ERA	LC_TIME	era description segments
ERA_D_FMT	LC_TIME	era date format string
ERA_D_T_FMT	LC_TIME	era date and time format string
ERA_T_FMT	LC_TIME	era time format string
ALT_DIGITS	LC_TIME	alternative symbols for digits
RADIXCHAR	LC_NUMERIC	radix character
THOUSEP	LC_NUMERIC	separator for thousands
YESEXPR	LC_MESSAGES	affirmative response expression
NOEXPR	LC_MESSAGES	negative response expression
YESSTR	LC_MESSAGES	affirmative response for yes/no queries
NOSTR	LC_MESSAGES	negative response ro yes/no queries
CRNCYSTR	LC_MONETARY	local currency symbol, preceded by '-' if the symbol sould appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character

If the locale's values for `p_cs_precedes` and `n_cs_precedes` do not match, the value of `nl_langinfo(CRNCYSTR)` is unspecified.

The `<langinfo.h>` header declares the following as a function:

```
char *nl_langinfo(nl_item);
```

Inclusion of `<langinfo.h>` header may also make visible all symbols from `<nl_types.h>`.

**USAGE** Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of `langinfo` data. In particular, the `strptime(3C)` function should be used to access date and time information defined in category `LC_TIME`. The `localeconv(3C)` function should be used to access information corresponding to `RADIXCHAR`, `THOUSEP`, and `CRNCYSTR`.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** `mkmsgs(1)`, `localeconv(3C)`, `nl_langinfo(3C)`, `nl_types.h(3HEAD)`, `setlocale(3C)`, `strftime(3C)`, `attributes(5)`, `standards(5)`

## libadm(3LIB)

<b>NAME</b>	libadm – general administrative library	
<b>SYNOPSIS</b>	cc [ <i>flag...</i> ] <i>file...</i> -ladm [ <i>library...</i> ]	
<b>DESCRIPTION</b>	Functions in this library provide device management, VTOC handling, regular expressions, and packaging routines.	
<b>INTERFACES</b>	The shared object <code>libadm.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.	
	circf	loc1
	loc2	locs
	nbra	pkgdir
	read_vtoc	sed
	write_vtoc	
<b>FILES</b>	/lib/libadm.so.1	shared object
	/lib/64/libadm.so.1	64-bit shared object
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:	

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit)
	SUNWcslx (64-bit)

## libauto\_ef(3LIB)

- NAME** libauto\_ef – auto encoding finder library
- SYNOPSIS**

```
cc [ flag... ] file... -lauto_ef [ library... ]
#include <auto_ef.h>
```
- DESCRIPTION** Functions in this library provide automatic encoding identification.
- INTERFACE LEVEL** The shared object `libauto_ef.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.
- auto\_ef\_file auto\_ef\_free  
auto\_ef\_get\_encoding auto\_ef\_get\_score  
auto\_ef\_str
- FILES** `/usr/lib/libauto_ef.so.1` shared object  
`/usr/lib/64/libauto_ef.so.1` 64-bit shared object
- ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWautoef (32-bit) SUNWautoefx (64-bit)
Interface Stability	Stable
MT-Level	MT-Safe

**SEE ALSO** [auto\\_ef\(1\)](#), [auto\\_ef\(3EXT\)](#), [attributes\(5\)](#)

*International Language Environments Guide*

**NAME** libbsdmalloc – memory allocator interface library

**SYNOPSIS** `cc [ flag... ] file... -lbsdmalloc [ library... ]  
#include <stdlib.h>`

**DESCRIPTION** Functions in this library provide a collection of `malloc` routines that use BSD semantics.

**INTERFACES** The shared object `libbsdmalloc.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

`free` `malloc`

`realloc`

**FILES** `/usr/lib/libbsdmalloc.so.1` shared object  
`/usr/lib/64/libbsdmalloc.so.1` 64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for description of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
MT-Level	Unsafe

## libc(3LIB)

<b>NAME</b>	libc – C library																																														
<b>DESCRIPTION</b>	Functions in this library provide various facilities defined by System V, ANSI C, POSIX, and so on. See <a href="#">standards(5)</a> . In addition, those facilities previously defined in the internationalization and the wide-character libraries are now defined in this library, as are the facilities previously defined in the multithreading libraries, <a href="#">libthread</a> and <a href="#">libpthread</a> .																																														
<b>INTERFACES</b>	The shared object <code>libc.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.

<b>NAME</b>	libc_db – threads debugging library
<b>SYNOPSIS</b>	<pre>cc [ <i>flag</i> ... ] <i>file</i> ... -lc_db [ <i>library</i> ... ] #include &lt;proc_service.h&gt; #include &lt;thread_db.h&gt;</pre>
<b>DESCRIPTION</b>	<p>The libc_db library provides support for monitoring and manipulating threads-related aspects of a multithreaded program. There are at least two processes involved, the controlling process and one or more target processes. The controlling process is the libc_db client, which links with libc_db and uses libc_db to inspect or modify threads-related aspects of one or more target processes. The target processes must be multithreaded processes that use libc. The controlling process might or might not be multithreaded itself.</p> <p>The most commonly anticipated use for libc_db is that the controlling process will be a debugger for a multithreaded program, hence the "db" in libc_db.</p> <p>The libc_db library is dependent on the internal implementation details of libc. It is a "friend" of libc in the C++ sense, which is precisely the "value added" by libc_db. It encapsulates the knowledge of libc internals that a debugger needs to manipulate the threads-related state of a target process.</p> <p>To be able to inspect and manipulate target processes, libc_db makes use of certain process control primitives that must be provided by the process using libc_db. The imported interfaces are defined in proc_service(3PROC). In other words, the controlling process is linked with libc_db and calls routines in libc_db. In turn, libc_db calls certain routines that it expects the controlling process to provide. These process control primitives allow libc_db to:</p> <ul style="list-style-type: none"> <li>■ Look up symbols in a target process.</li> <li>■ Stop and continue individual lightweight processes ( LWPs) within a target process.</li> <li>■ Stop and continue an entire target process.</li> <li>■ Read and write memory and registers in a target process.</li> </ul> <p>Initially, a controlling process obtains a handle for a target process. Through that handle it can then obtain handles for the component objects of the target process, its threads, its synchronization objects, and its thread-specific-data keys.</p> <p>When libc_db needs to return sets of handles to the controlling process, for example, when returning handles for all the threads in a target process, it uses an iterator function. An iterator function calls back a client-specified function once for each handle to be returned, passing one handle back on each call to the callback function. The calling function also passes another parameter to the iterator function, which the iterator function passes on to the callback function. This makes it easy to build a linked list of thread handles for a particular target process. The additional parameter is the head of the linked list, and the callback function simply inserts the current handle into the linked list.</p>

## libc\_db(3LIB)

Callback functions are expected to return an integer. Iteration terminates early if a callback function returns a non-zero value. Otherwise, iteration terminates when there are no more handles to pass back.

**INTERFACES** The shared object `libc_db.so.1` provides the public interfaces defined below. See `intro(3)` for additional information on shared object interfaces.

<b>NAME</b>	libdat – direct access transport library	
<b>SYNOPSIS</b>	<pre>cc [ <i>flag...</i> ] <i>file...</i> -ldat [ <i>library...</i> ] #include &lt;dat/udat.h&gt;</pre>	
<b>DESCRIPTION</b>	<p>The libdat library provides an application with the User Direct Access Programming Library (uDAPL) 1.2 functions to access the underlying RDMA-able interconnects. Different uDAPL service providers listed in the DAT static registry <code>dat.conf(4)</code> can be registered during runtime with the DAT library. After an application opens an interface adapter belonging to a particular service provider, all function calls will be redirected to that service provider's library.</p>	
<b>INTERFACES</b>	<p>The shared object <code>libdat.so.1</code> provides the public interfaces defined below for applications. See <a href="#">intro(3)</a> for additional information on shared object interfaces.</p>	
<b>uDAPL 1.1</b>	<pre>dat_cno_create dat_cno_modify_agent dat_cno_wait dat_cr_handoff dat_cr_reject dat_ep_create dat_ep_dup_connect dat_ep_get_status dat_ep_post_rdma_read dat_ep_post_recv dat_ep_query dat_evd_clear_unwaitable dat_evd_dequeue dat_evd_enable dat_evd_modify_cno dat_evd_query dat_evd_set_unwaitable dat_get_consumer_context dat_ia_close dat_ia_query dat_lmr_free</pre>	<pre>dat_cno_free dat_cno_query dat_cr_accept dat_cr_query dat_ep_connect dat_ep_disconnect dat_ep_free dat_ep_modify dat_ep_post_rdma_write dat_ep_post_send dat_ep_reset dat_evd_create dat_evd_disable dat_evd_free dat_evd_post_se dat_evd_resize dat_evd_wait dat_get_handle_type dat_ia_open dat_lmr_create dat_lmr_query</pre>

libdat(3LIB)

```

dat_psp_create            dat_psp_create_any
dat_psp_free             dat_psp_query
dat_pz_create            dat_pz_free
dat_pz_query            dat_registry_list_providers
dat_rmr_bind            dat_rmr_create
dat_rmr_free            dat_rmr_query
dat_rsp_create          dat_rsp_free
dat_rsp_query          dat_set_consumer_context
dat_strerror

```

**uDAPL 1.2**

```

dat_ep_create_with_srq    dat_ep_recv_query
dat_ep_set_watermark     dat_lmr_sync_rdma_read
dat_lmr_sync_rdma_write  dat_srq_create
dat_srq_free            dat_srq_post_recv
dat_srq_query          dat_srq_resize
dat_srq_set_lw

```

The shared object `libdat.so.1` also provides the public interfaces defined below for service providers.

**FILES**

```

dat_registry_add_provider          dat_registry_remove_provider
/usr/lib/libdat.so.1              shared object
/usr/lib/64/libdat.so.1          64-bit shared object

```

**ATTRIBUTES**

See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWudaplu (user) SUNWudaplr (root)
Interface Stability	Standard: uDAPL, 1.1, 1.2
MT-Level	Unsafe

**SEE ALSO** `datadm(1M)`, `intro(3)`, `dat.conf(4)`, `attributes(5)`

**NOTES** The `libdat` library supports service providers written according to the uDAPL 1.2 specification. A service provider library has to be a dynamic loadable shared object with two public entry points exported:

```
dat_provider_init                dat_provider_fini
```

In terms of installation, the service provider package should include a `service_provider.conf(4)` file. The `datadm(1M)` administrative configuration program should be used to add and remove service provider's entries in the system-wide `dat.conf(4)`.

## libdbm(3LIBUCB)

<b>NAME</b>	libdbm – database subroutines library																
<b>SYNOPSIS</b>	<pre>cc [ <i>flag...</i> ] -I /usr/ucbinclude <i>file...</i> -L /usr/libucb \ -R /usr/libucb -ldbmm [ <i>library...</i> ]</pre>																
<b>DESCRIPTION</b>	Functions in this library maintain key/content pairs in a database. The functions will handle very large (a billion blocks) databases and will access a keyed item in one or two file system accesses.

## libdevinfo(3LIB)

<b>NAME</b>	libdevinfo – device information library
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -ldevinfo [ library... ] #include &lt;libdevinfo.h&gt;</pre>
<b>DESCRIPTION</b>	<p>Functions in this library access device configuration information.</p> <p>Device configuration data is organized as a tree of device nodes, defined as <code>di_node_t</code> in the <code>libdevinfo</code> interfaces. Each <code>di_node_t</code> represents a physical or logical (pseudo) device. Three types of data are associated with device nodes:</p> <ul style="list-style-type: none"><li>■ data defined for all device nodes (attributes)</li><li>■ properties specific to each device</li><li>■ minor node data</li></ul> <p>All device nodes have a set of common attributes, such as a node name, an instance number, and a driver binding name. Common device node attributes are accessed by calling interfaces listed on the <code>di_binding_name(3DEVINFO)</code> manual page. Each device node also has a physical path, which is accessed by calling <code>di_devfs_path(3DEVINFO)</code>.</p> <p>Properties provide device specific information for device configuration and usage. Properties can be defined by software (<code>di_prop_t</code>) or by firmware (<code>di_prom_prop_t</code>). One way to access each <code>di_prop_t</code> is to make successive calls to <code>di_prop_next(3DEVINFO)</code> until <code>DI_PROP_NIL</code> is returned. For each <code>di_prop_t</code>, use interfaces on the <code>di_prop_bytes(3DEVINFO)</code> manual page to obtain property names and values. Another way to access these properties is to call <code>di_prop_lookup_bytes(3DEVINFO)</code> to find the value of a property with a given name. Accessing a <code>di_prom_prop_t</code> is similar to accessing a <code>di_prop_t</code>, except that the interface names start with <code>di_prom_prop</code> and additional calls to <code>di_prom_init(3DEVINFO)</code> and <code>di_prom_fini(3DEVINFO)</code> are required.</p> <p>Minor nodes contain information exported by the device for creating special files for the device. Each device node has 0 or more minor nodes associated with it. A list minor nodes (<code>di_minor_t</code>) can be obtained by making successive calls to <code>di_minor_next(3DEVINFO)</code> until <code>DI_MINOR_NIL</code> is returned. For each minor node, <code>di_minor_devt(3DEVINFO)</code> and related interfaces are called to get minor node data.</p> <p>Using <code>libdevinfo</code> involves three steps:</p> <ul style="list-style-type: none"><li>■ Creating a snapshot of the device tree</li><li>■ Traversing the device tree to get information of interest</li><li>■ Destroying the snapshot of the device tree</li></ul> <p>A snapshot of the device tree is created by calling <code>di_init(3DEVINFO)</code> and destroyed by calling <code>di_fini(3DEVINFO)</code>. An application can specify the data to be included in the snapshot (full or partial tree, include or exclude properties and minor nodes) and get a handle to the root of the device tree. See <code>di_init(3DEVINFO)</code> for details. The application then traverses the device tree in the snapshot to obtain device configuration data.</p>

The device tree is normally traversed through parent-child-sibling linkage. Each device node contains references to its parent, its next sibling, and the first of its children. Given the `di_node_t` returned from `di_init()`, one can find all children by first calling `di_child_node(3DEVINFO)`, followed by successive calls to `di_sibling_node(3DEVINFO)` until `DI_NODE_NIL` is returned. By following this procedure recursively, an application can visit all device nodes contained in the snapshot. Two interfaces, `di_walk_node(3DEVINFO)` and `di_walk_minor(3DEVINFO)` functions are provided to facilitate device tree traversal. The `di_walk_node()` function visits all device nodes and executes a user-supplied callback function for each node visited. The `di_walk_minor()` function does the same for each minor node in the device tree.

An alternative way to traverse the device tree is through the per-driver device node linkage. Device nodes contain a reference to the next device node bound to the same driver. Given the `di_node_t` returned from `di_init()`, an application can find all device nodes bound to a driver by first calling `di_drv_first_node(3DEVINFO)`, followed by successive calls to `di_drv_next_node(3DEVINFO)` until `DI_NODE_NIL` is returned. Traversing the per-driver device node list works only when the snapshot includes all device nodes.

See `di_init(3DEVINFO)` for examples of `libdevinfo` usage. See *Writing Device Drivers* for information about Solaris device configuration.

## INTERFACES

The shared object `libdevinfo.so.1` provides the public interfaces defined below. See `intro(3)` for additional information on shared object interfaces.

### EXAMPLES **EXAMPLE 1** Information accessible through libdevinfo interfaces

The following example illustrates the kind of information accessible through libdevinfo interfaces for a device node representing a hard disk (sd2):

```
Attributes
  node name:  sd
  instance:   2
  physical path: /sbus@1f,0/espdma@e,8400000/esp@e,8800000/sd@2,0

Properties
  target=2
  lun=0

Minor nodes
  (disk partition /dev/dsk/c0t2d0s0)
  name:      a
  dev_t:     0x0080010 (32/16)
```

**EXAMPLE 1** Information accessible through libdevinfo interfaces (Continued)

```
spectype:  IF_BLK (block special)
(disk partition /dev/rdisk/c0t2d0s2)
name:      c,raw
dev_t:     0x0080012 (32/18)
spectype:  IF_CHR (character special)
```

**FILES** /lib/libdevinfo.so.1 shared object  
 /usr/lib/64/libdevinfo.so.1 64-bit shared object

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

**NAME** libdmi – Sun Solstice Enterprise Agent DMI library

**SYNOPSIS** `cc [ flag... ] file... -ldmi -lnsl -lrwtool [ library... ]`

**DESCRIPTION** The libdmi library is a Solstice Enterprise Agent DMI generic library. It supports the DMI service provider, management application, and component instrumentation with data encoding, RPC communication, and other functionalities. This library is linked with management application and component instrumentation programs.

**INTERFACES** The shared object `libdmi.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

```

dmi_error                freeDmiString
newDmiAttributeValues    newDmiOctetStringFromString
newDmiString              printDmiDataUnion
printDmiString

```

**FILES**

<code>/usr/lib/libdmi.so.1</code>	shared object
<code>/usr/lib/64/libdmi.so.1</code>	64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

## libdoor(3LIB)

<b>NAME</b>	libdoor – doors library										
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -ldoor [ library... ] #include &lt;door.h&gt;</pre>										
<b>DESCRIPTION</b>	The functions in this library provide programmatic access to doors, including the ability to create and call them. Doors are a fast light-weight RPC mechanism for secure control transfer between processes on the same machine. Conceptually, a thread in one process can issue a call using a door descriptor that causes code to be executed in another process and then returns using the traditional synchronous RPC model. Doors can also be used to pass data and file descriptors between processes.										
<b>INTERFACES</b>	The shared object <code>libdoor.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.										
	<table><tr><td><code>door_bind</code></td><td><code>door_call</code></td></tr><tr><td><code>door_create</code></td><td><code>door_cred</code></td></tr><tr><td><code>door_info</code></td><td><code>door_return</code></td></tr><tr><td><code>door_revoke</code></td><td><code>door_server_create</code></td></tr><tr><td><code>door_ucred</code></td><td><code>door_unbind</code></td></tr></table>	<code>door_bind</code>	<code>door_call</code>	<code>door_create</code>	<code>door_cred</code>	<code>door_info</code>	<code>door_return</code>	<code>door_revoke</code>	<code>door_server_create</code>	<code>door_ucred</code>	<code>door_unbind</code>
<code>door_bind</code>	<code>door_call</code>

Stevens, W. Richard. *UNIX Network Programming, Volume 2: Interprocess Communications, 2/e*. Tucson, Ariz.: Prentice Hall, 1999.

- NAME** libdtrace – DTrace dynamic tracing software library
- DESCRIPTION** Functions in this library define the interface for interacting with the DTrace dynamic tracing software, including the D language compiler and facilities for enabling probes and consuming trace data.
- INTERFACES** The interfaces provided by libdtrace.so.1 are currently private to the implementation of the Solaris system and DTrace subsystem and are subject to change at any time without notice. Applications using these interfaces might fail to run on future releases. Refer to the *Solaris Dynamic Tracing Guide* for a description of the public documented interfaces available for the DTrace facility.
- FILES** /usr/lib/libdtrace.so.1           shared object  
/usr/lib/64/libdtrace.so.1        64-bit shared object
- ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWdtrc
Interface Stability	Private
MT-Level	Unsafe

## libhbaapi(3LIB)

<b>NAME</b>	libhbaapi – Common Fibre Channel HBA information library																														
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -lhbaapi [ library... ] #include &lt;hbaapi.h&gt;</pre>																														
<b>DESCRIPTION</b>	<p>The functions in this library access Fibre Channel HBA data.</p> <p>Fibre Channel HBA information is provided through a standard interface in a vendor independent manner. This common interface provides access to the following information:</p> <ul style="list-style-type: none"><li>■ Local HBA attributes</li><li>■ Local HBA port attributes and statistics</li><li>■ Mapping between FCP-2 discovered devices and operating system SCSI information</li><li>■ Discovered devices port attributes</li><li>■ SCSI commands for discovered FCP-2 devices (Report LUNS, Read Capacity, and Inquiry)</li><li>■ Common Transport commands to discover Fabric details</li></ul>																														
<b>INTERFACES</b>	<p>The shared object <code>libhbaapi.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.</p> <table><tr><td>HBA_CloseAdapter</td><td>HBA_FreeLibrary</td></tr><tr><td>HBA_GetAdapterAttributes</td><td>HBA_GetAdapterName</td></tr><tr><td>HBA_GetAdapterPortAttributes</td><td>HBA_GetBindingCapability</td></tr><tr><td>HBA_GetBindingSupport</td><td>HBA_GetDiscoveredPortAttributes</td></tr><tr><td>HBA_GetEventBuffer</td><td>HBA_GetFC4Statistics</td></tr><tr><td>HBA_GetFCPStatistics</td><td>HBA_GetFcpPersistentBinding</td></tr><tr><td>HBA_GetFcpTargetMapping</td><td>HBA_GetFcpTargetMappingV2</td></tr><tr><td>HBA_GetNumberOfAdapters</td><td>HBA_GetPersistentBindingV2</td></tr><tr><td>HBA_GetPortAttributesByWWN</td><td>HBA_GetPortStatistics</td></tr><tr><td>HBA_GetRNIDMgmtInfo</td><td>HBA_GetVendorLibraryAttributes</td></tr><tr><td>HBA_GetVersion</td><td>HBA_GetWrapperLibraryAttributes</td></tr><tr><td>HBA_LoadLibrary</td><td>HBA_OpenAdapter</td></tr><tr><td>HBA_OpenAdapterByWWN</td><td>HBA_RefreshAdapterConfiguration</td></tr><tr><td>HBA_RefreshInformation</td><td>HBA_RegisterForAdapterAddEvents</td></tr><tr><td>HBA_RegisterForAdapterEvents</td><td>HBA_RegisterForAdapterPortEvents</td></tr></table>	HBA_CloseAdapter	HBA_FreeLibrary	HBA_GetAdapterAttributes	HBA_GetAdapterName	HBA_GetAdapterPortAttributes	HBA_GetBindingCapability	HBA_GetBindingSupport	HBA_GetDiscoveredPortAttributes	HBA_GetEventBuffer	HBA_GetFC4Statistics	HBA_GetFCPStatistics	HBA_GetFcpPersistentBinding	HBA_GetFcpTargetMapping	HBA_GetFcpTargetMappingV2	HBA_GetNumberOfAdapters	HBA_GetPersistentBindingV2	HBA_GetPortAttributesByWWN	HBA_GetPortStatistics	HBA_GetRNIDMgmtInfo	HBA_GetVendorLibraryAttributes	HBA_GetVersion	HBA_GetWrapperLibraryAttributes	HBA_LoadLibrary	HBA_OpenAdapter	HBA_OpenAdapterByWWN	HBA_RefreshAdapterConfiguration	HBA_RefreshInformation	HBA_RegisterForAdapterAddEvents	HBA_RegisterForAdapterEvents	HBA_RegisterForAdapterPortEvents

HBA_SendSRL	HBA_SendScsiInquiry
HBA_SetBindingSupport	HBA_SetPersistentBindingV2
HBA_SetRNIDMgmtInfo	

**USAGE** Client applications link with the Common Library (using `-lHBAAPI`) to access the interfaces. The Common Library dynamically loads individual Vendor-Specific Libraries (VSL) listed in `/etc/hba.conf` described on the `hba.conf(4)`.

Using the `libhbaapi` involves the following steps:

1. Optionally determining the version of the library by calling `HBA_GetVersion(3HBAAPI)`.
2. Initializing the Common Library by calling `HBA_LoadLibrary(3HBAAPI)`.
3. Determine the number of HBAs known to the common library by calling `HBA_GetNumberOfAdapters(3HBAAPI)`.
4. Determine each HBA name in turn by calling `HBA_GetAdapterName(3HBAAPI)`.
5. Open each HBA in turn by calling `HBA_OpenAdapter(3HBAAPI)`.
6. Operate on a given HBA by calling the following:
  - `HBA_GetAdapterAttributes(3HBAAPI)`
  - `HBA_GetAdapterPortAttributes(3HBAAPI)`
  - `HBA_GetDiscoveredPortAttributes(3HBAAPI)`
  - `HBA_GetPortAttributesByWWN(3HBAAPI)`
  - `HBA_SendCTPassThru(3HBAAPI)`
  - `HBA_SendCTPassThruV2(3HBAAPI)`
  - `HBA_GetEventBuffer(3HBAAPI)`
  - `HBA_SetRNIDMgmtInfo(3HBAAPI)`
  - `HBA_GetRNIDMgmtInfo(3HBAAPI)`
  - `HBA_SendRNID(3HBAAPI)`
  - `HBA_SendRNIDV2(3HBAAPI)`
  - `HBA_RefreshInformation(3HBAAPI)`

## libhbaapi(3LIB)

- HBA\_RefreshAdapterConfiguration(3HBAAPI)
- HBA\_GetVendorLibraryAttributes(3HBAAPI)
- HBA\_GetWrapperLibraryAttributes(3HBAAPI)
- HBA\_ResetStatistics(3HBAAPI)
- HBA\_GetFcpTargetMapping(3HBAAPI)
- HBA\_GetFcpTargetMappingV2(3HBAAPI)
- HBA\_GetFcpPersistentBinding(3HBAAPI)
- HBA\_SendScsiInquiry(3HBAAPI)
- HBA\_SendReportLUNs(3HBAAPI)
- HBA\_ScsiReportLUNsV2(3HBAAPI)
- HBA\_SendReadCapacity(3HBAAPI)
- HBA\_SendRLS(3HBAAPI)

7. Close open HBAs by calling `HBA_CloseAdapter(3HBAAPI)`.

8. Unload the library by calling `HBA_FreeLibrary(3HBAAPI)`.

### ERRORS

Errors are generally returned from the underlying VSL and can include any of the following values:

`HBA_STATUS_OK`

Request completed successfully. (No Error)

`HBA_STATUS_ERROR`

Non-specific error encountered.

`HBA_STATUS_ERROR_NOT_SUPPORTED`

The VSL does not support this interface.

`HBA_STATUS_ERROR_INVALID_HANDLE`

The *handle* argument does not refer to an open HBA handle.

`HBA_STATUS_ERROR_ARG`

An argument in the request was invalid.

`HBA_STATUS_ERROR_ILLEGAL_WWN`

A WWN in the request was not recognized.

`HBA_STATUS_ERROR_ILLEGAL_INDEX`

An index in the request was not recognized.

`HBA_STATUS_ERROR_MORE_DATA`

A larger buffer is required to complete the requested operation.

`HBA_STATUS_ERROR_STALE_DATA`

The state of the HBA has changed, possibly due to Dynamic Reconfiguration or devices being added or removed. The caller should call `HBA_RefreshInformation(3HBAAPI)` and reissue any discovery logic to reset all indexes related to this HBA.

`HBA_STATUS_SCSI_CHECK_CONDITION`

A SCSI check-condition was encountered during the I/O operation. Not all VSLs report this error value. Some might return `HBA_STATUS_ERROR` when a check-condition is encountered, or `HBA_STATUS_OK`.

HBA\_STATUS\_ERROR\_BUSY

The requested device is busy. A retry might be effective.

HBA\_STATUS\_ERROR\_TRY\_AGAIN

The requested I/O timed out. A retry might be effective.

HBA\_STATUS\_ERROR\_UNAVAILABLE

The requested HBA has been removed or deactivated.

All other error values are reserved.

## libidnkit(3LIB)

<b>NAME</b>	libidnkit – IDN conversion library								
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -lidnkit [ library... ] #include &lt;idn/api.h&gt;</pre>								
<b>DESCRIPTION</b>	<p>Functions in this library provide conversions between ACE string and multibyte character string of the current locale or a specified codeset. They support various manipulations of internationalized domain names, including encoding conversion and name preparation. They are designed according to IDNA framework where each application must do necessary preparations for the internationalized domain names before passing them to the resolver. The library provides easy-to-use, high-level interfaces to help applications with the preparation.</p> <p>The <code>libidnkit</code> library internally uses <code>iconv(3C)</code> to provide encoding conversion from UTF-8 to the local encoding (such as ISO8859-1, usually determined by the current locale), and from the local encoding to UTF-8.</p>								
<b>INTERFACES</b>	<p>The shared object <code>libidnkit.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.</p> <pre>idn_decodename                idn_decodename2 idn_enable                    idn_encodename idn_nameinit</pre>								
<b>FILES</b>	<pre>/usr/lib/libidnkit.so.1      shared object /usr/lib/64/libidnkit.so.1   64-bit shared object</pre>

**NAME** libkstat – kernel statistics library

**SYNOPSIS** `cc [ flag... ] file... -lkstat [ library... ]  
#include <kstat.h>`

**DESCRIPTION** Functions in this library provide a general-purpose mechanism for providing kernel statistics to users.

**INTERFACES** The shared object `libkstat.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

```

kstat_chain_update          kstat_close
kstat_data_lookup          kstat_lookup
kstat_open                  kstat_read
kstat_write

```

**FILES**

<code>/lib/libkstat.so.1</code>	shared object
<code>/lib/64/libkstat.so.1</code>	64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
Interface Stability	Stable
MT-Level	Unsafe

**SEE ALSO** [pvs\(1\)](#), [intro\(3\)](#), [kstat\(3KSTAT\)](#), [attributes\(5\)](#)

## libkvm(3LIB)

<b>NAME</b>	libkvm – Kernel Virtual Memory access library														
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -lkvm [ library ... ] #include &lt;kvm.h&gt;</pre>														
<b>DESCRIPTION</b>	Functions in this library provide application access to kernel symbols, addresses and values. The individual functions are documented in Section 3KVM of the reference manual.														
<b>INTERFACES</b>	The shared object <code>libkvm.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.														
	<table> <tr> <td><code>kvm_close</code></td> <td><code>kvm_getcmd</code></td> </tr> <tr> <td><code>kvm_getproc</code></td> <td><code>kvm_getu</code></td> </tr> <tr> <td><code>kvm_kread</code></td> <td><code>kvm_kwrite</code></td> </tr> <tr> <td><code>kvm_nextproc</code></td> <td><code>kvm_nlist</code></td> </tr> <tr> <td><code>kvm_open</code></td> <td><code>kvm_read</code></td> </tr> <tr> <td><code>kvm_setproc</code></td> <td><code>kvm_uread</code></td> </tr> <tr> <td><code>kvm_uwrite</code></td> <td><code>kvm_write</code></td> </tr> </table>	<code>kvm_close</code>	<code>kvm_getcmd</code>	<code>kvm_getproc</code>	<code>kvm_getu</code>	<code>kvm_kread</code>	<code>kvm_kwrite</code>	<code>kvm_nextproc</code>	<code>kvm_nlist</code>	<code>kvm_open</code>	<code>kvm_read</code>	<code>kvm_setproc</code>	<code>kvm_uread</code>	<code>kvm_uwrite</code>	<code>kvm_write</code>

<code>/usr/lib/libkvm.so.1</code>	shared object														
<code>/usr/lib/64/libkvm.so.1</code>	64-bit shared object														
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:														

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
Interface Stability	<code>kvm_read()</code> and <code>kvm_write()</code> are Obsolete; the remaining functions are Stable.
MT-Level	Unsafe

**SEE ALSO** [pvs\(1\)](#), [intro\(3\)](#), [attributes\(5\)](#)

**NAME** libl – lex library

**SYNOPSIS** `cc [ flag... ] file... [ library... ]`

**DESCRIPTION** Functions in this library provide user interfaces to the `lex(1)` library.

**INTERFACES** The shared object `libl.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

<code>allprint</code>	<code>allprint_w</code>
<code>main</code>	<code>sprint</code>
<code>sprint_w</code>	<code>yyles</code>
<code>yyles_e</code>	<code>yyles_w</code>
<code>yyracc</code>	<code>yyreject</code>
<code>yyreject_e</code>	<code>yyreject_w</code>
<code>yywrap</code>	

**FILES** `/usr/lib/libl.so.1` shared object  
`/usr/lib/64/libl.so.1` 64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
MT-Level	Unsafe

**SEE ALSO** [lex\(1\)](#), [intro\(3\)](#), [attributes\(5\)](#)

## liblayout(3LIB)

- NAME** liblayout – layout service library
- SYNOPSIS** `cc [ flag... ] file... -llayout [ library... ]  
#include <sys/layout.h>`
- DESCRIPTION** Functions in this library provide various layout service routines.
- INTERFACES** The shared object `liblayout.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.
- `m_create_layout` `m_destroy_layout`  
`m_getvalues_layout` `m_setvalues_layout`  
`m_transform_layout` `m_wtransform_layout`
- FILES** `/usr/lib/liblayout.so.1` shared object  
`/usr/lib/64/liblayout.so.1` 64-bit shared object.
- ATTRIBUTES** See [attributes\(5\)](#) for description of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWctpls
MT-Level	MT-Safe

**SEE ALSO** [intro\(3\)](#), [attributes\(5\)](#)

**NAME** liblgrp – locality group library

**SYNOPSIS** `cc [ flag... ] file... -llgrp [ library... ]  
#include <sys/lgrp_user.h>`

**DESCRIPTION** The functions in this library traverse the lgroup (locality group) hierarchy, discover its contents, and set a thread's affinity for an lgroup. A locality group represents the set of CPU-like and memory-like hardware devices that are at most some locality apart from each other.

**INTERFACES** The shared object `liblgrp.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

<code>lgrp_affinity_get</code>	<code>lgrp_affinity_set</code>
<code>lgrp_children</code>	<code>lgrp_cookie_stale</code>
<code>lgrp_cpus</code>	<code>lgrp_fini</code>
<code>lgrp_home</code>	<code>lgrp_init</code>
<code>lgrp_latency</code>	<code>lgrp_mem_size</code>
<code>lgrp_nlgrps</code>	<code>lgrp_parents</code>
<code>lgrp_root</code>	<code>lgrp_version</code>
<code>lgrp_view</code>	

**FILES**

<code>/usr/lib/liblgrp.so.1</code>	shared object
<code>/usr/lib/64/liblgrp.so.1</code>	64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
Interface Stability	Evolving
MT-Level	MT-Safe

**SEE ALSO** [intro\(3\)](#), [lgrp\\_affinity\\_get\(3LGRP\)](#), [lgrp\\_children\(3LGRP\)](#), [lgrp\\_cookie\\_stale\(3LGRP\)](#), [lgrp\\_cpus\(3LGRP\)](#), [lgrp\\_fini\(3LGRP\)](#), [lgrp\\_home\(3LGRP\)](#), [lgrp\\_init\(3LGRP\)](#), [lgrp\\_latency\(3LGRP\)](#), [lgrp\\_mem\\_size\(3LGRP\)](#), [lgrp\\_nlgrps\(3LGRP\)](#), [lgrp\\_parents\(3LGRP\)](#), [lgrp\\_root\(3LGRP\)](#), [lgrp\\_version\(3LGRP\)](#), [lgrp\\_view\(3LGRP\)](#), [attributes\(5\)](#)

## libm(3LIB)

<b>NAME</b>	libm – C math library																																														
<b>SYNOPSIS</b>	cc [ <i>flag...</i> ] <i>file...</i> -lm [ <i>library...</i> ]																																														
<b>DESCRIPTION</b>	Functions in this library provide common elementary mathematical functions and floating point environment routines defined by System V, ANSI C, POSIX, and so on. See <a href="#">standards(5)</a> . Additional functions in this library provide extended support for handling floating point exceptions.																																														
<b>INTERFACES</b>	The shared object <code>libm.so.2</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.

## ACCURACY

ISO/IEC 9899:1999, also known as C99, specifies the functions listed in the following tables and states that the accuracy of these functions is “implementation-defined”. The information below characterizes the accuracy of these functions as implemented in `libm.so.2`. For each function, the tables provide an upper bound on the largest error possible for any argument and the largest error actually observed among a large sample of arguments. Errors are expressed in “units in the last place”, or ulps, relative to the exact function value for each argument (regarding the argument as exact). UlpS depend on the precision of the floating point format: if  $y$  is the exact function value,  $x$  and  $x'$  are adjacent floating point numbers such that  $x < y < x'$ , and  $x''$  is the computed function value, then provided  $x$ ,  $x'$ , and  $x''$  all lie in the same binade, the error in  $x''$  is  $|y - x''| / |x - x'|$  ulps. In particular, when the error is less than one ulp, the computed value is one of the two floating point numbers adjacent to the exact value.

The bounds and observed errors listed below apply only in the default floating point modes. Specifically, on SPARC, these bounds assume the rounding direction is round-to-nearest and non-standard mode is disabled. On x86, the bounds assume the rounding direction is round-to-nearest and the rounding precision is round-to-64-bits. Moreover, on x86, floating point function values are returned in a floating point register in extended double precision format, but the bounds below assume that the result value is then stored to memory in the format corresponding to the function’s type.

The error bounds listed below are believed to be correct, but smaller bounds might be proved later. The observed errors are the largest ones currently known, but larger errors might be discovered later. Numbers in the notes column refer to the notes following the tables.

## Real Functions

tan1	4.5	2.366	
tanh1	4.5	2.417	
tgamma1	1.0	< 1	

**Notes:**

[1] On SPARC, `sqrtf`, `sqrt`, and `sqrt1` are correctly rounded in accordance with IEEE 754. On x86, `sqrt1` is correctly rounded, `sqrtf` is correctly rounded provided the result is narrowed to single precision as discussed above, but `sqrt` might not be correctly rounded due to “double rounding”: when the intermediate value computed to extended precision lies exactly halfway between two representable numbers in double precision, the result of rounding the intermediate value to double precision is determined by the round-ties-to-even rule. If this rule causes the second rounding to round in the same direction as the first, the net rounding error can exceed 0.5 ulps. (The error is bounded instead by  $0.5 \cdot (1 + 2^{-11})$  ulps.)

[2] Error bounds for `lgamma` and `lgamma1` apply only for positive arguments.

**Complex functions**

The real-valued complex functions `cabsf`, `cabs`, `cabs1`, `cargf`, `carg`, and `carg1` are equivalent to the real functions `hypotf`, `hypot`, `hypot1`, `atan2f`, `atan2`, and `atan21`, respectively. The error bounds and observed errors given above for the latter functions also apply to the former.

The complex functions listed below are complex-valued. For each function, the error bound shown applies separately to both the real and imaginary parts of the result. (For example, both the real and imaginary parts of  $\operatorname{cacosf}(z)$  are accurate to within 1 ulp regardless of their magnitudes.) Similarly, the largest observed error shown is the largest error found in either the real or the imaginary part of the result.

**Notes:**

- [1] The complex hyperbolic trigonometric functions are equivalent by symmetries to their circular trigonometric counterparts. Because the implementations of these functions exploit these symmetries, corresponding functions have the same error bounds and observed errors.
- [2] For large arguments, the results computed by `cpowf`, `cpow`, and `cpowl` can have unbounded relative error. It might be possible to give error bounds for specific domains, but no such bounds are currently available. The observed errors shown are for the domain  $\{(z,w) : \max(|\operatorname{Re} z|, |\operatorname{Im} z|, |\operatorname{Re} w|, |\operatorname{Im} w|) \leq 1\}$ .

**FILES** /lib/libm.so.2 shared object  
 /lib/64/libm.so.2 64-bit shared object

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWlibmsr
MT-Level	Safe with exceptions

As described on the `lgamma(3M)` manual page, `gamma()` and `lgamma()` and their `float` and `long double` counterparts are Unafe. All other functions in `libm.so.2` are MT-Safe.

## libmapmalloc(3LIB)

**NAME** libmapmalloc – alternative memory allocator library

**SYNOPSIS** `cc [ flag... ] file... -lmapmalloc [ library... ]  
#include <stdlib.h>`

**DESCRIPTION** Functions in this library provide `malloc` routines that use `mmap(2)` instead of `sbrk(2)` for acquiring heap space.

**INTERFACES** The shared object `libmapmalloc.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

`calloc` `cfree`  
`free` `mallinfo`  
`malloc` `mallopt`  
`memalign` `realloc`  
`valloc`

**FILES** `/usr/lib/libmapmalloc.so.1` shared object  
`/usr/lib/64/libmapmalloc.so.1` 64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit)
	SUNWcslx (64-bit)
MT-Level	Safe

**NAME** libmd5 – MD5 hashing library

**SYNOPSIS** `cc [ flag... ] file... -lmd5 [ library... ]  
#include <md5.h>`

**DESCRIPTION** Functions in this library provide MD5 hashing routines.

**INTERFACES** The shared object `libmd5.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

MD5Final	MD5Init
MD5Update	md5_calc

**FILES**

<code>/lib/libmd5.so.1</code>	shared object
<code>/lib/64/libmd5.so.1</code>	64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for description of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
MT-Level	MT-Safe

**SEE ALSO** [intro\(3\)](#), [attributes\(5\)](#)

## libmenu(3LIB)

<b>NAME</b>	libmenu – menus library																																																
<b>SYNOPSIS</b>	<code>cc [ <i>flag...</i> ] <i>file...</i> -lmenu [ <i>library...</i> ]</code>																																																
<b>DESCRIPTION</b>	Functions in this library provide menus using <a href="#">libcurses(3LIB)</a> routines.																																																
<b>INTERFACES</b>	The shared object <code>libmenu.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.																																																
	<table><tr><td><code>current_item</code></td><td><code>free_item</code></td></tr><tr><td><code>free_menu</code></td><td><code>item_count</code></td></tr><tr><td><code>item_description</code></td><td><code>item_index</code></td></tr><tr><td><code>item_init</code></td><td><code>item_name</code></td></tr><tr><td><code>item_opts</code></td><td><code>item_opts_off</code></td></tr><tr><td><code>item_opts_on</code></td><td><code>item_term</code></td></tr><tr><td><code>item_userptr</code></td><td><code>item_value</code></td></tr><tr><td><code>item_visible</code></td><td><code>menu_back</code></td></tr><tr><td><code>menu_driver</code></td><td><code>menu_fore</code></td></tr><tr><td><code>menu_format</code></td><td><code>menu_grey</code></td></tr><tr><td><code>menu_init</code></td><td><code>menu_items</code></td></tr><tr><td><code>menu_mark</code></td><td><code>menu_opts</code></td></tr><tr><td><code>menu_opts_off</code></td><td><code>menu_opts_on</code></td></tr><tr><td><code>menu_pad</code></td><td><code>menu_pattern</code></td></tr><tr><td><code>menu_sub</code></td><td><code>menu_term</code></td></tr><tr><td><code>menu_userptr</code></td><td><code>menu_win</code></td></tr><tr><td><code>new_item</code></td><td><code>new_menu</code></td></tr><tr><td><code>pos_menu_cursor</code></td><td><code>post_menu</code></td></tr><tr><td><code>scale_menu</code></td><td><code>set_current_item</code></td></tr><tr><td><code>set_item_init</code></td><td><code>set_item_opts</code></td></tr><tr><td><code>set_item_term</code></td><td><code>set_item_userptr</code></td></tr><tr><td><code>set_item_value</code></td><td><code>set_menu_back</code></td></tr><tr><td><code>set_menu_fore</code></td><td><code>set_menu_format</code></td></tr><tr><td><code>set_menu_grey</code></td><td><code>set_menu_init</code></td></tr></table>	<code>current_item</code>	<code>free_item</code>	<code>free_menu</code>	<code>item_count</code>	<code>item_description</code>	<code>item_index</code>	<code>item_init</code>	<code>item_name</code>	<code>item_opts</code>	<code>item_opts_off</code>	<code>item_opts_on</code>	<code>item_term</code>	<code>item_userptr</code>	<code>item_value</code>	<code>item_visible</code>	<code>menu_back</code>	<code>menu_driver</code>	<code>menu_fore</code>	<code>menu_format</code>	<code>menu_grey</code>	<code>menu_init</code>	<code>menu_items</code>	<code>menu_mark</code>	<code>menu_opts</code>	<code>menu_opts_off</code>	<code>menu_opts_on</code>	<code>menu_pad</code>	<code>menu_pattern</code>	<code>menu_sub</code>	<code>menu_term</code>	<code>menu_userptr</code>	<code>menu_win</code>	<code>new_item</code>	<code>new_menu</code>	<code>pos_menu_cursor</code>	<code>post_menu</code>	<code>scale_menu</code>	<code>set_current_item</code>	<code>set_item_init</code>	<code>set_item_opts</code>	<code>set_item_term</code>	<code>set_item_userptr</code>	<code>set_item_value</code>	<code>set_menu_back</code>	<code>set_menu_fore</code>	<code>set_menu_format</code>	<code>set_menu_grey</code>	<code>set_menu_init</code>

## libmllib(3LIB)

<b>NAME</b>	libmllib – mediaLib library
<b>SYNOPSIS</b>	<pre>cc [ <i>flag...</i> ] <i>file...</i> -lmllib [ <i>library...</i> ] #include &lt;mllib.h&gt;</pre>
<b>DESCRIPTION</b>	Interfaces in this library provide functions for multimedia processing. When executed on an UltraSPARC platform, these functions take advantage of the VIS Instruction Set.
<b>INTERFACES</b>	The shared object <code>libmllib.so.2</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.
<b>System Functions</b>	<code>mllib_free</code> <code>mllib_malloc</code> <code>mllib_memcpy</code> <code>mllib_memmove</code> <code>mllib_memset</code> <code>mllib_realloc</code> <code>mllib_version</code>
<b>Algebra Functions</b>	<code>mllib_MatrixAdd_S16C_Mod</code> <code>mllib_MatrixAdd_S16C_S16C_Mod</code> <code>mllib_MatrixAdd_S16C_S16C_Sat</code> <code>mllib_MatrixAdd_S16C_S8C_Mod</code> <code>mllib_MatrixAdd_S16C_S8C_Sat</code> <code>mllib_MatrixAdd_S16C_Sat</code> <code>mllib_MatrixAdd_S16C_U8C_Mod</code> <code>mllib_MatrixAdd_S16C_U8C_Sat</code> <code>mllib_MatrixAdd_S16_Mod</code> <code>mllib_MatrixAdd_S16_S16_Mod</code> <code>mllib_MatrixAdd_S16_S16_Sat</code> <code>mllib_MatrixAdd_S16_S8_Mod</code> <code>mllib_MatrixAdd_S16_S8_Sat</code> <code>mllib_MatrixAdd_S16_Sat</code> <code>mllib_MatrixAdd_S16_U8_Mod</code> <code>mllib_MatrixAdd_S16_U8_Sat</code> <code>mllib_MatrixAdd_S32C_Mod</code> <code>mllib_MatrixAdd_S32C_S16C_Mod</code> <code>mllib_MatrixAdd_S32C_S16C_Sat</code> <code>mllib_MatrixAdd_S32C_S32C_Mod</code> <code>mllib_MatrixAdd_S32C_S32C_Sat</code> <code>mllib_MatrixAdd_S32C_Sat</code> <code>mllib_MatrixAdd_S32_Mod</code> <code>mllib_MatrixAdd_S32_S16_Mod</code> <code>mllib_MatrixAdd_S32_S16_Sat</code> <code>mllib_MatrixAdd_S32_S32_Mod</code> <code>mllib_MatrixAdd_S32_S32_Sat</code> <code>mllib_MatrixAdd_S32_Sat</code> <code>mllib_MatrixAdd_S8C_Mod</code> <code>mllib_MatrixAdd_S8C_S8C_Mod</code>

libmtmalloc(3LIB)

**NAME** libmtmalloc – multi-threaded memory allocator library

**SYNOPSIS** `cc [ flag... ] file... -lmtmalloc [ library... ]  
#include <mtmalloc.h>`

**DESCRIPTION** Functions in this library provide concurrent access to heap space.

**INTERFACES** The shared object `libmtmalloc.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

`free` `malloc`  
`mallocctl` `memalign`  
`realloc` `valloc`

**FILES** `/usr/lib/libmtmalloc.so.1` shared object

- NAME** libmvec – vector math library
- SYNOPSIS** `cc [ flag... ] file... -lmvec [ library... ]`
- DESCRIPTION** This library contains function to evaluate common mathematical functions for several arguments at once. The argument values are specified by one or more vectors (arrays) of data, and the corresponding result values are stored in another vector.
- INTERFACES** The shared object `libmvec.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

## libnls(3LIB)

- NAME** libnls – network listener service library
- SYNOPSIS** `cc [ flag... ] file... -lnls [ library... ]`
- DESCRIPTION** The functions in this library interact with the network listener daemon, `listen(1M)`. The functions are provided for services invoked by the listener daemon and for clients that connect to the services using `listen`.
- INTERFACES** The shared object `libnls.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.
- `nlsgetcall` `nlsprovider`
- `nlsrequest`
- FILES** `/usr/lib/libnls.so.1` shared object  
`/usr/lib/64/libnls.so.1` 64-bit shared object
- ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
MT-Level	Unsafe

**SEE ALSO** `listen(1M)`, [intro\(3\)](#), [attributes\(5\)](#)

<b>NAME</b>	libnsl – network services library																																						
<b>SYNOPSIS</b>	<code>cc [ <i>flag...</i> ] <i>file...</i> -lnsl [ <i>library...</i> ]</code>																																						
<b>DESCRIPTION</b>	<p>Functions in this library provide routines that provide a transport-level interface to networking services for applications, facilities for machine-independent data representation, a remote procedure call mechanism, and other networking services useful for application programs.</p> <p>Some symbols are not intended to be referenced directly. Rather, they are exposed because they are used elsewhere through a private interface. One such example is the set of symbols beginning with the <code>_xti</code> prefix. Those symbols are used in implementing the X/Open Transport Interface (XTI) interfaces documented in <code>libxnet</code>. See <code>libxnet(3LIB)</code>.</p>																																						
<b>INTERFACES</b>	<p>The shared object <code>libnsl.so.1</code> provides the public interfaces defined below. ## libpam(3LIB)

<b>NAME</b>	libpam – PAM (Pluggable Authentication Module) library																		
<b>SYNOPSIS</b>	<pre>cc [ <i>flag...</i> ] <i>file...</i> -lpam [ <i>library...</i> ] #include &lt;security/pam_appl.h&gt;</pre>																		
<b>DESCRIPTION</b>	Functions in this library provide routines for the Pluggable Authentication Module (PAM).																		
<b>INTERFACES</b>	The shared object <code>libpam.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.																		
	<table><tr><td><code>pam_acct_mgmt</code></td><td><code>pam_authenticate</code></td></tr><tr><td><code>pam_chauthtok</code></td><td><code>pam_close_session</code></td></tr><tr><td><code>pam_end</code></td><td><code>pam_get_data</code></td></tr><tr><td><code>pam_get_item</code></td><td><code>pam_get_user</code></td></tr><tr><td><code>pam_getenv</code></td><td><code>pam_getenvlist</code></td></tr><tr><td><code>pam_open_session</code></td><td><code>pam_putenv</code></td></tr><tr><td><code>pam_set_data</code></td><td><code>pam_set_item</code></td></tr><tr><td><code>pam_setcred</code></td><td><code>pam_start</code></td></tr><tr><td><code>pam_strerror</code></td><td></td></tr></table>	<code>pam_acct_mgmt</code>	<code>pam_authenticate</code>	<code>pam_chauthtok</code>	<code>pam_close_session</code>	<code>pam_end</code>	<code>pam_get_data</code>	<code>pam_get_item</code>	<code>pam_get_user</code>	<code>pam_getenv</code>	<code>pam_getenvlist</code>	<code>pam_open_session</code>	<code>pam_putenv</code>	<code>pam_set_data</code>	<code>pam_set_item</code>	<code>pam_setcred</code>	<code>pam_start</code>	<code>pam_strerror</code>	
<code>pam_acct_mgmt</code>	<code>pam_authenticate</code>																		
<code>pam_chauthtok</code>	<code>pam_close_session</code>																		
<code>pam_end</code>	<code>pam_get_data</code>																		
<code>pam_get_item</code>	<code>pam_get_user</code>																		
<code>pam_getenv</code>	<code>pam_getenvlist</code>																		
<code>pam_open_session</code>	<code>pam_putenv</code>																		
<code>pam_set_data</code>	<code>pam_set_item</code>																		
<code>pam_setcred</code>	<code>pam_start</code>																		
<code>pam_strerror</code>																			
<b>FILES</b>	<pre>/lib/libpam.so.1   shared object  /etc/pam.conf   configuration file  /usr/lib/security/pam_dial_auth.so.1   authentication management PAM module for dialups  /usr/lib/security/pam_rhosts_auth.so.1   authentication management PAM modules that use <code>ruserok()</code>  /usr/lib/security/pam_sample.so.1   sample PAM module</pre>																		
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for description of the following attributes:																		

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl
MT Level	MT-Safe with exceptions

**SEE ALSO** | pvs(1), [intro\(3\)](#), pam(3PAM), pam.conf(4), attributes(5),  
pam\_authok\_check(5), pam\_authok\_get(5), pam\_authok\_store(5),  
pam\_dial\_auth(5), pam\_dhkeys(5), pam\_passwd\_auth(5), pam\_rhosts\_auth(5),  
pam\_sample(5), pam\_unix\_account(5), pam\_unix\_auth(5),  
pam\_unix\_session(5)

**NOTES** | The functions in libpam are MT-Safe only if each thread within the multithreaded application uses its own PAM handle.

The pam\_unix(5) module is no longer supported. Similar functionality is provided by pam\_authok\_check(5), pam\_authok\_get(5), pam\_authok\_store(5), pam\_dhkeys(5), pam\_passwd\_auth(5), pam\_unix\_account(5), pam\_unix\_auth(5), and pam\_unix\_session(5).

## libpanel(3LIB)

<b>NAME</b>	libpanel – panels library
<b>SYNOPSIS</b>	cc [ <i>flag...</i> ] <i>file...</i> -lpanel [ <i>library...</i> ]
<b>DESCRIPTION</b>	Functions in this library provide panels using <a href="#">libcurses(3LIB)</a> routines.
<b>INTERFACES</b>	The shared object <code>libpanel.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.  bottom_panel                      del_panel hide_panel                         move_panel new_panel                          panel_above panel_below                        panel_hidden panel_userptr                      panel_window replace_panel                      set_panel_userptr show_panel                         top_panel update_panels
<b>FILES</b>	<code>/usr/lib/libpanel.so.1</code> shared object <code>/usr/lib/64/libpanel.so.1</code> 64-bit shared object
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE

MT-Level	Unsafe

**SEE ALSO** [intro\(3\)](#), [libcurses\(3LIB\)](#), [attributes\(5\)](#)

<b>NAME</b>	libpctx – process context library							
<b>SYNOPSIS</b>	cc [ <i>flag...</i> ] <i>file...</i> -lpctx [ <i>library...</i> ]							
<b>DESCRIPTION</b>	<p>Functions in this library provide a simple means to access the underlying facilities of <code>proc(4)</code> to allow a controlling process to manipulate the state of a controlled process.</p> <p>This library is primarily for use in conjunction with the <code>libcpc(3LIB)</code> library. Used together, these libraries allow developers to construct tools that can manipulate CPU performance counters in other processes. The <code>cputrack(1)</code> utility is an example of such a tool.</p>							
<b>INTERFACES</b>	<p>The shared object <code>libpctx.so.1</code> provides the public interfaces defined below. See <code>intro(3)</code> for additional information on shared object interfaces.</p> <table> <tr> <td><code>pctx_capture</code></td> <td><code>pctx_create</code></td> </tr> <tr> <td><code>pctx_release</code></td> <td><code>pctx_run</code></td> </tr> <tr> <td><code>pctx_set_events</code></td> <td></td> </tr> </table>		<code>pctx_capture</code>	<code>pctx_create</code>	<code>pctx_release</code>	<code>pctx_run</code>	<code>pctx_set_events</code>

## libpkcs11(3LIB)

<b>NAME</b>	libpkcs11 – PKCS#11 Cryptographic Framework library								
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -lpkcs11 [ library... ] #include &lt;security/pkcs11.h&gt; #include &lt;security/cryptki.h&gt;</pre>								
<b>DESCRIPTION</b>	<p>The <code>libpkcs11</code> library implements the RSA Security Inc. PKCS#11 Cryptographic Token Interface (Cryptoki), v2.11 specification by using plug-ins to provide the slots.</p> <p>Each plug-in, which also implements RSA PKCS#11 v2.11, represents one or more slots. If more than one plug-in is available, a meta slot is created that provides the mechanisms of all plug-ins in a single slot. When available, the meta slot is always the first slot provided by <code>libpkcs11</code>. The meta slot does not provide token-based objects.</p> <p>This library filters the list of mechanisms available from plug-ins based on the policy set by <code>cryptoadm(1M)</code>.</p> <p>This library provides entry points for all PKCS#11 v2.11 functions. See the RSA PKCS#11 v2.11 specification at <a href="http://www.rsasecurity/rsalabs/pkcs/pkcs-11">http://www.rsasecurity/rsalabs/pkcs/pkcs-11</a>.</p> <p>Plug-ins are added to <code>libpkcs11</code> by the <code>pkcs11conf</code> class action script during execution of <code>pkgadd(1M)</code>. The available mechanisms are administered by the <code>cryptoadm(1M)</code> utility.</p> <p>Plug-ins must have all of their library dependencies specified, including <code>libc(3LIB)</code>. Libraries that have unresolved symbols, including those from <code>libc</code>, will be rejected and a message will be sent to <code>syslog(3C)</code> for such plug-ins.</p> <p>Due to U.S. Export regulations, all plug-ins are required to be cryptographically signed using the <code>elfsign</code> utility.</p> <p>Any plug-in that is not signed or is not a compatible version of PKCS#11 will be dropped by <code>libpkcs11</code>. When a plug-in is dropped, the administrator is alerted by the <code>syslog(3C)</code> utility.</p> <p>The <code>&lt;security/pkcs11f.h&gt;</code> header contains function definitions. The <code>&lt;security/pkcs11t.h&gt;</code> header contains type definitions. Applications can include either of these headers in place of <code>&lt;security/pkcs11.h&gt;</code>, which contains both function and type definitions.</p>								
<b>INTERFACES</b>	The shared object <code>libpkcs11.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.

libpkcs11(3LIB)

**SUNW Extensions**      SUNW\_C\_GetMechSession                      SUNW\_C\_KeyToObject

**FILES**                      /usr/lib/libpkcs11.so.1                      shared object  
                                  /usr/lib/64/libpkcs11.so.1                  64-bit shared object

**ATTRIBUTES**              See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
Interface Stability	See below.
MT-Level	See below.

The SUNW Extension functions are Evolving. The PKCS#11 Standard functions are Standard: PKCS#11 v2.11.

The SUNW Extension functions are MT-Safe. The PKCS#11 Standard functions are MT-Safe with exceptions. See Section 6.5.2 of RSA PKCS#11 v2.11.

**SEE ALSO**                      cryptoadm(1M), pkgadd(1M), [intro\(3\)](#), [SUNW\\_C\\_GetMechSession\(3EXT\)](#), [syslog\(3C\)](#), [attributes\(5\)](#), [pkcs11\\_kernel\(5\)](#), [pkcs11\\_softtoken\(5\)](#)

RSA PKCS#11 v2.11 <http://www.rsasecurity/rsalabs/pkcs/pkcs-11>

**NOTES**                      If an application calls `C_WaitForSlotEvent()` without the `CKF_DONT_BLOCK` flag set, `libpkcs11` must create threads internally. If, however, `CKF_LIBRARY_CANT_CREATE_OS_THREADS` is set, `C_WaitForSlotEvent()` returns `CKR_FUNCTION_FAILED`.

The PKCS#11 library does not work with Netscape 4.x but does work with more recent versions of Netscape and Mozilla.

Because `C_Initialize()` might have been called by both an application and a library, it is not safe for a library or its plugins to call `C_Finalize()`. A library can be finished calling functions from `libpkcs11`, while an application might not.

**NAME** libplot, lib300, lib300s, lib4014, lib450, libvt0 – graphics interface libraries

**SYNOPSIS** `cc [ flag... ] file... -lplot [ library... ]  
#include <plot.h>`

**DESCRIPTION** Functions in this library generate graphics output.

**INTERFACES** The shared object `libplot.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

<b>NAME</b>	libpool – pool configuration manipulation library												
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... [ library... ] #include &lt;pool.h&gt;</pre>												
<b>DESCRIPTION</b>	<p>The functions in this library define the interface for reading and writing resource pools configuration files, as well as that for committing an existing configuration to becoming the running OS configuration (with respect to partitioning subsystems). The <code>&lt;pool.h&gt;</code> header provides type and function declarations for all library services.</p> <p>The resource pools facility brings together process-bindable resources into a common abstraction called a pool. Processor sets and other entities can be configured, grouped, and labelled in a persistent fashion such that workload components can be associated with a subset of a system's total resources. The <code>libpool</code> library provides a C language API for accessing this functionality, while <code>pooladm(1M)</code>, <code>poolbind(1M)</code>, and <code>poolcfg(1M)</code> make this facility available through command invocations from a shell. Each of those manual pages describes aspects of the pools facility; this page describes the properties available to the various entities managed within the pools facility. These entities include the system, pools, and the <code>pset</code> resources for processor sets.</p> <p>When the pools facility is enabled on a system, the behavior of the following functions is modified.</p> <table border="1"> <thead> <tr> <th>System Call</th> <th>Error Value</th> </tr> </thead> <tbody> <tr> <td><code>pset_assign(pset != PS_QUERY)</code></td> <td>ENOTSUP</td> </tr> <tr> <td><code>pset_bind(pset != PS_QUERY)</code></td> <td>ENOTSUP</td> </tr> <tr> <td><code>pset_create()</code></td> <td>ENOTSUP</td> </tr> <tr> <td><code>pset_destroy()</code></td> <td>ENOTSUP</td> </tr> <tr> <td><code>pset_setattr()</code></td> <td>ENOTSUP</td> </tr> </tbody> </table> <p>Each active entity within the resource pools framework can have an arbitrary collection of named, typed properties associated with it. Properties supported by the pools framework are listed, with descriptions, under each entity below. In general, resource properties can be one of five types: boolean, signed and unsigned integers, floating point, and string values.</p> <p>All entities and resources support a string property for commenting purposes; this property is available for use by management applications to record descriptions and other administrator oriented data. The comment field is not used by the default pools commands, except when a configuration is initiated by the <code>poolcfg</code> utility, in which case an informative message is placed in the <code>system.comment</code> property for that configuration.</p>	System Call	Error Value	<code>pset_assign(pset != PS_QUERY)</code>	ENOTSUP	<code>pset_bind(pset != PS_QUERY)</code>	ENOTSUP	<code>pset_create()</code>	ENOTSUP	<code>pset_destroy()</code>	ENOTSUP	<code>pset_setattr()</code>	ENOTSUP
System Call	Error Value												
<code>pset_assign(pset != PS_QUERY)</code>	ENOTSUP												
<code>pset_bind(pset != PS_QUERY)</code>	ENOTSUP												
<code>pset_create()</code>	ENOTSUP												
<code>pset_destroy()</code>	ENOTSUP												
<code>pset_setattr()</code>	ENOTSUP												

## libpool(3LIB)

## System

Property name	Type	Description
<code>system.allocate-method</code>	string	Allocation method to use when this configuration is instantiated
<code>system.bind-default</code>	boolean	If specified pool not found, bind to pool with 'pool.default' property set to true
<code>system.comment</code>	string	User description of system
<code>system.name</code>	string	User name for the configuration
<code>system.version</code>	int	libpool version required to manipulate this configuration
<code>system.poold.log-level</code>	string	poold logging level
<code>system.poold.log-location</code>	string	poold logging location
<code>system.poold.history-file</code>	string	poold decision history location
<code>system.poold.monitor-interval</code>	uint	poold monitoring sample interval
<code>system.poold.objectives</code>	string	poold objectives for a system.

The `system.allocate-method`, `system.bind-default`, `system.comment`, `system.name`, `system.poold.log-level`, `system.poold.log-location`, `system.poold.history-file`, `system.poold.monitor-interval`, and `system.poold.objectives` properties are writable; the `system.version` property is not.

The `system.allocate-method` property accepts only two values, "importance based" and "surplus to default". The default value for this property is "importance based". The property is optional and if it is not present the library will allocate resources as though it were present and had the default value. These strings are defined in `<pool.h>` as `POA_IMPORTANCE` and `POA_SURPLUS_TO_DEFAULT`.

If "importance based" allocation is defined, then during a commit the library will allocate resources to pools using an algorithm that observes minimum and maximum constraints for resources but favors those resources with greater importance.

If "surplus to default" is defined, then during a commit the library will allocate minimum resources to all resource sets apart from default which will receive any surplus.

The `system.bind-default` property defaults to true. This property interacts with the `project.pool` resource control to specify the binding behavior for processes associated with a project. If `project.pool` is not specified, then this property has no effect. If `project.pool` is specified and the specified pool exists, this property has no effect. If the specified pool does not exist, perhaps because of a reconfiguration, then this property controls the binding behavior for the project member. If `system.bind-default` is true, then the project member is bound to the default pool

(identified as the pool for which `pool.default` is true); otherwise the project member is refused access to the system. Care should be taken with the pools configuration if this property is set to false, so as to avoid denying users access to the system.

The various `poold` properties are used to configure the operation of `poold(1M)`.

The `system.poold.log-level` property is used to specify the level of detail provided in log messages. Valid values are: `ALERT`, `CRIT`, `ERR`, `WARNING`, `NOTICE`, `INFO`, and `DEBUG`.

`ALERT` provides the least level of detail, `DEBUG` the greatest. See `syslog(3C)` for more information about the meaning of these debug levels. If this property is not specified, the default value `NOTICE` is used.

The `system.poold.log-location` property is used to specify the location of the logfiles generated by `poold`. The special value of “`syslog`” indicates that logged messages should be written to `syslog()`. If this property is not specified, the default location `/var/log/pool` is used.

The `system.poold.history-file` specifies the location of the decision history file which is used by `poold` to improve the quality of its decision making over time. If this property is not specified, the default location `/var/adm/pool` is used.

The `system.poold.monitor-interval` property specifies the monitoring interval (in milliseconds) to be used by `poold` when sampling utilization statistics. If this property is not specified, the default value of 15 seconds is used.

The `system.poold.objectives` property specifies any system wide objectives. An objectives property has the following syntax:

```
objectives = objective [; objective]*
objective = [n:] keyword [op] [value]
```

All objectives are prefixed with an optional importance. The importance acts as a multiplier for the objective and thus increases the significance of its contribution to the objective function evaluation. If no importance is specified, the default value is 1.

The “`wt-load`” objective is the only objective to which a system element can be set. This objective favors configurations that match resource allocations to resource utilization. A resource set that uses more resources will be given more resources when this objective is active. An administrator should use this objective when he is relatively satisfied with the constraints established using the minimum and maximum properties and would like the DRP to manipulate resources freely within those constraints.

## Pools

Property name	Type	Description
<code>pool.active</code>	boolean	Mark this pool as active, if true.

## libpool(3LIB)

Property name	Type	Description
<code>pool.comment</code>	string	User description of pool.
<code>pool.default</code>	boolean	Mark this pool as the default pool, if true; see <code>system.bind-default</code> property.
<code>pool.importance</code>	int	Relative importance of this pool; for possible resource dispute resolution.
<code>pool.name</code>	string	User name for pool; used by <code>setproject(3PROJECT)</code> as value for 'project.pool' project attribute in <code>project(4)</code> database.
<code>pool.scheduler</code>	string	Scheduler class to which consumers of this pool will be bound. This property is optional and if not specified, the scheduler bindings for consumers of this pool are not affected.
<code>pool.sys_id</code>	int	System-assigned pool ID.

The `pool.default` and `pool.sys_id` properties are not writable; all other listed properties are writable.

If `pool.scheduler` is specified, it must be set to the name of a valid scheduling class for the system. See the `-c` option for `pricntl(1)` for a list of valid class names.

### Processor Sets

Property name	Type	Description
<code>pset.comment</code>	string	User description of resource.
<code>pset.default</code>	boolean	Marks default processor set.
<code>pset.load</code>	uint	The load for this processor set.
<code>pset.max</code>	uint	Maximum number of CPUs permitted in this processor set.
<code>pset.min</code>	uint	Minimum number of CPUs permitted in this processor set.
<code>pset.name</code>	string	User name for resource.
<code>pset.size</code>	uint	Current number of CPUs in this processor set.
<code>pset.sys_id</code>	int	System-assigned processor set ID.
<code>pset.type</code>	string	Names resource type; value for all processor sets is <code>pset</code> .
<code>pset.units</code>	string	Identifies meaning of size-related properties; value for all processor sets is <code>population</code> .

Property name	Type	Description
<code>pset.poold.objectives</code>	string	Specifies the poold objectives for a pset.

The `pset.comment`, `pset.max`, `pset.min`, `pset.name`, and `pset.poold.objectives` properties are writable; the `pset.default`, `pset.load`, `pset.size`, `pset.sys_id`, `pset.type`, and `pset.units` properties are not.

The `pset.load` property represents the load on a processor set. The lowest value for this property is 0. The value of `pset.load` increases in a linear fashion with the load on the set, as measured by the number of jobs in the system run queue.

The `pset.poold.objectives` property specifies an objective which is specific to a particular pset. See the `system.poold.objectives` entry for the specification of this property's syntax.

There are two types of objectives that can be set on a pset:

<code>locality</code>	This objective influences the impact that locality, as measured by lgroup data, has upon the chosen configuration. This objective can take one of three values:
<code>tight</code>	If set, configurations that maximize resource locality are favored.
<code>loose</code>	If set, configurations that minimize resource locality are favored.
<code>none</code>	This is the default value for this objective. If set, configuration favorability is uninfluenced by resource locality.
<code>utilization</code>	This objective favors configurations that allocate resources to partitions that are failing to preserve the specified utilization objective.

These objectives are specified in terms of an operator and a value. The operators are

<	The "less than" operator is used to indicate that the specified value should be treated as a maximum target value.
>	The "greater than" operator is used to indicate that the specified value should be treated as a minimum target value.
~	The "about" operator is used to indicate that the specified value should be treated as a target value about which some fluctuation is acceptable.

Only one objective of each type of operator can be set. For example, if the ~ operator is set, the < and > operators cannot be set. It is possible to set a < and a > operator together; the values will be validated to ensure that they do not overlap.

## libpool(3LIB)

### Processors

Property name	Type	Description
<code>cpu.comment</code>	string	User description of CPU.
<code>cpu.pinned</code>	boolean	CPU pinned to this processor set.
<code>cpu.status</code>	int	Processor status, on-line, offline or interrupts disabled.
<code>cpu.sys_id</code>	int	System-assigned processor ID.

The `cpu.comment`, `cpu.pinned`, and `cpu.status` properties are writeable.

The `cpu.status` property can be set only to the following values:

<code>off-line</code>	Set the CPU offline.
<code>on-line</code>	Set the CPU online.
<code>no-intr</code>	Disable interrupt processing on the CPU.

These values are defined in `<sys/processor.h>` as the `PS_OFFLINE`, `PS_ONLINE`, and `PS_NOINTR` macros.

### INTERFACES

The shared object `libpool.so.1` provides the public interfaces defined below. See `intro(3)` for additional information on shared object interfaces.

**NOTES** Functions in `libpool` can be used to manipulate static configurations even when the pools facility is not enabled. See [pooladm\(1M\)](#) and [pool\\_set\\_status\(3POOL\)](#) for more information about enabling the pools facility. The pools facility must be enabled, however, to modify the dynamic configuration.

**NAME** libproject – project database access library

**SYNOPSIS** `cc [ flag... ] file... -lproject [ library... ]  
#include <project.h>`

**DESCRIPTION** Functions in this library provide various interfaces to extract data from the project(4) database. The header provides structure and function declarations for all library interfaces.

**INTERFACES** The shared object `libproject.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

## libpthread(3LIB)

<b>NAME</b>	libpthread – POSIX threads library																																								
<b>SYNOPSIS</b>	<code>cc -mt [ <i>flag...</i> ] <i>file...</i> -lpthread [ -lrt <i>library...</i> ]</code>																																								
<b>DESCRIPTION</b>	<p>Historically, functions in this library provided POSIX threading support. See <a href="#">standards(5)</a>. This functionality now resides in <a href="#">libc(3LIB)</a>.</p> <p>This library is maintained to provide backward compatibility for both runtime and compilation environments. The shared object is implemented as a filter on <code>libc.so.1</code>. New application development needs to specify <code>-lpthread</code> only to obtain POSIX semantics for <code>fork(2)</code> that assumes the behavior of <code>fork1(2)</code> rather than the default behavior that forks all threads.</p>																																								
<b>INTERFACES</b>	<p>The shared object <code>libpthread.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.</p> <table><tr><td><code>__pthread_cleanup_pop</code></td><td><code>__pthread_cleanup_push</code></td></tr><tr><td><code>pthread_attr_destroy</code></td><td><code>pthread_attr_getdetachstate</code></td></tr><tr><td><code>pthread_attr_getguardsize</code></td><td><code>pthread_attr_getinheritsched</code></td></tr><tr><td><code>pthread_attr_getschedparam</code></td><td><code>pthread_attr_getschedpolicy</code></td></tr><tr><td><code>pthread_attr_getscope</code></td><td><code>pthread_attr_getstackaddr</code></td></tr><tr><td><code>pthread_attr_getstacksize</code></td><td><code>pthread_attr_init</code></td></tr><tr><td><code>pthread_attr_setdetachstate</code></td><td><code>pthread_attr_setguardsize</code></td></tr><tr><td><code>pthread_attr_setinheritsched</code></td><td><code>pthread_attr_setschedparam</code></td></tr><tr><td><code>pthread_attr_setschedpolicy</code></td><td><code>pthread_attr_setscope</code></td></tr><tr><td><code>pthread_attr_setstackaddr</code></td><td><code>pthread_attr_setstacksize</code></td></tr><tr><td><code>pthread_cancel</code></td><td><code>pthread_cond_broadcast</code></td></tr><tr><td><code>pthread_cond_destroy</code></td><td><code>pthread_cond_init</code></td></tr><tr><td><code>pthread_cond_reltimedwait_np</code></td><td><code>pthread_cond_signal</code></td></tr><tr><td><code>pthread_cond_timedwait</code></td><td><code>pthread_cond_wait</code></td></tr><tr><td><code>pthread_condattr_destroy</code></td><td><code>pthread_condattr_getpshared</code></td></tr><tr><td><code>pthread_condattr_init</code></td><td><code>pthread_condattr_setpshared</code></td></tr><tr><td><code>pthread_create</code></td><td><code>pthread_detach</code></td></tr><tr><td><code>pthread_equal</code></td><td><code>pthread_exit</code></td></tr><tr><td><code>pthread_getconcurrency</code></td><td><code>pthread_getschedparam</code></td></tr><tr><td><code>pthread_getspecific</code></td><td><code>pthread_join</code></td></tr></table>	<code>__pthread_cleanup_pop</code>	<code>__pthread_cleanup_push</code>	<code>pthread_attr_destroy</code>	<code>pthread_attr_getdetachstate</code>	<code>pthread_attr_getguardsize</code>	<code>pthread_attr_getinheritsched</code>	<code>pthread_attr_getschedparam</code>	<code>pthread_attr_getschedpolicy</code>	<code>pthread_attr_getscope</code>	<code>pthread_attr_getstackaddr</code>	<code>pthread_attr_getstacksize</code>	<code>pthread_attr_init</code>	<code>pthread_attr_setdetachstate</code>	<code>pthread_attr_setguardsize</code>	<code>pthread_attr_setinheritsched</code>	<code>pthread_attr_setschedparam</code>	<code>pthread_attr_setschedpolicy</code>	<code>pthread_attr_setscope</code>	<code>pthread_attr_setstackaddr</code>	<code>pthread_attr_setstacksize</code>	<code>pthread_cancel</code>	<code>pthread_cond_broadcast</code>	<code>pthread_cond_destroy</code>	<code>pthread_cond_init</code>	<code>pthread_cond_reltimedwait_np</code>	<code>pthread_cond_signal</code>	<code>pthread_cond_timedwait</code>	<code>pthread_cond_wait</code>	<code>pthread_condattr_destroy</code>	<code>pthread_condattr_getpshared</code>	<code>pthread_condattr_init</code>	<code>pthread_condattr_setpshared</code>	<code>pthread_create</code>	<code>pthread_detach</code>	<code>pthread_equal</code>	<code>pthread_exit</code>	<code>pthread_getconcurrency</code>	<code>pthread_getschedparam</code>	<code>pthread_getspecific</code>	<code>pthread_join</code>

## librt(3LIB)

<b>NAME</b>	librt, libposix4 – POSIX.1b Realtime Extensions library																																				
<b>SYNOPSIS</b>	cc [ <i>flag...</i> ] <i>file...</i> -lrt [ <i>library...</i> ]																																				
<b>DESCRIPTION</b>	<p>Functions in this library provide most of the interfaces specified by the POSIX.1b Realtime Extension. See <a href="#">standards(5)</a>. Specifically, this includes the interfaces defined under the Asynchronous I/O, Message Passing, Process Scheduling, Realtime Signals Extension, Semaphores, Shared Memory Objects, Synchronized I/O, and Timers options. The interfaces defined under the Memory Mapped Files, Process Memory Locking, and Range Memory Locking options are provided in <a href="#">libc(3LIB)</a>.</p> <p>See the man pages for the individual interfaces in section 3RT for information on required headers.</p> <p>The name <code>libposix4</code> is maintained for backward compatibility and should be avoided. <code>librt</code> is the preferred name for this library.</p>																																				
<b>INTERFACES</b>	<p>The shared objects <code>librt.so.1</code> and <code>libposix4.so.1</code> provide the public interfaces defined below. ## librtld\_db(3LIB)

**NAME** librtld\_db – runtime linker debugging library

**SYNOPSIS**

```
cc [ flag ... ] file ... -lrtld_db [ library ... ]
#include <proc_service.h>
#include <rtld_db.h>
```

**DESCRIPTION** Functions in this library are useful for building debuggers for dynamically linked programs. For a full description of these interfaces refer to the *Linker and Libraries Guide*.

**INTERFACES** The shared object `librtld_db.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

<code>rd_delete</code>	<code>rd_errstr</code>
<code>rd_event_addr</code>	<code>rd_event_enable</code>
<code>rd_event_getmsg</code>	<code>rd_init</code>

*Linker and Libraries Guide*

<b>NAME</b>	libsass – Simple Authentication and Security Layer library																										
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -lsasl [ library... ] #include &lt;sasl/sasl.h&gt; #include &lt;sasl/prop.h&gt; #include sasl/saslutil.h</pre>																										
<b>DESCRIPTION</b>	<p>SASL is a security framework used by connection-oriented network applications primarily for authentication. Another way to describe SASL is that it is a glue layer between a network application and some security mechanisms that allow applications to authenticate each other and provide additional security services such as data encryption. As a glue layer, SASL hides the interface specifics of the security mechanism from the application, which allows greater portability and flexibility as new security mechanisms are implemented. SASL is similar to the GSS-API in that it provides a layer of abstraction between an application and one or more security mechanisms.</p> <p>libsass provides both an API for applications and an SPI for various plug-ins. To link with this library, specify <code>-lsasl</code> on the <code>cc</code> command line.</p>																										
<b>INTERFACES</b>	<p>The shared object <code>libsass.so.1</code> and associated include files provide the public interfaces defined below. The <code>*_t</code> interfaces are function prototypes for callbacks that are defined in the public SASL header files. While libsass provides default versions for some of the callbacks, this structure allows an application to define its own version of the some of the callback functions.</p> <p>See <a href="#">intro(3)</a> for additional information on shared object interfaces.</p> <table border="0" style="width: 100%;"> <tr> <td><code>prop_clear</code></td> <td><code>prop_dispose</code></td> </tr> <tr> <td><code>prop_dup</code></td> <td><code>prop_erase</code></td> </tr> <tr> <td><code>prop_format</code></td> <td><code>prop_get</code></td> </tr> <tr> <td><code>prop_getnames</code></td> <td><code>prop_new</code></td> </tr> <tr> <td><code>prop_request</code></td> <td><code>prop_set</code></td> </tr> <tr> <td><code>prop_setvals</code></td> <td><code>sasl_authorize_t</code></td> </tr> <tr> <td><code>sasl_auxprop</code></td> <td><code>sasl_auxprop_add_plugin</code></td> </tr> <tr> <td><code>sasl_auxprop_getctx</code></td> <td><code>sasl_auxprop_request</code></td> </tr> <tr> <td><code>sasl_canon_user_t</code></td> <td><code>sasl_canonuser_add_plugin</code></td> </tr> <tr> <td><code>sasl_chalprompt_t</code></td> <td><code>sasl_checkapop</code></td> </tr> <tr> <td><code>sasl_checkpass</code></td> <td><code>sasl_client_add_plugin</code></td> </tr> <tr> <td><code>sasl_client_init</code></td> <td><code>sasl_client_new</code></td> </tr> <tr> <td><code>sasl_client_plug_init_t</code></td> <td><code>sasl_client_start</code></td> </tr> </table>	<code>prop_clear</code>	<code>prop_dispose</code>	<code>prop_dup</code>	<code>prop_erase</code>	<code>prop_format</code>	<code>prop_get</code>	<code>prop_getnames</code>	<code>prop_new</code>	<code>prop_request</code>	<code>prop_set</code>	<code>prop_setvals</code>	<code>sasl_authorize_t</code>	<code>sasl_auxprop</code>	<code>sasl_auxprop_add_plugin</code>	<code>sasl_auxprop_getctx</code>	<code>sasl_auxprop_request</code>	<code>sasl_canon_user_t</code>	<code>sasl_canonuser_add_plugin</code>	<code>sasl_chalprompt_t</code>	<code>sasl_checkapop</code>	<code>sasl_checkpass</code>	<code>sasl_client_add_plugin</code>	<code>sasl_client_init</code>	<code>sasl_client_new</code>	<code>sasl_client_plug_init_t</code>	<code>sasl_client_start</code>

## libssagent(3LIB)

- NAME** libssagent – Sun Solstice Enterprise Agent library
- SYNOPSIS** `cc [ flag... ] file... -lssagent [ library.. ]`
- DESCRIPTION** The libssagent library is a high level API library that is dependent on libssasnm. This library contains the starting point of the request-driven engine that always runs in the background within the subagent. It receives SNMP requests, evaluates variables, calls the appropriate functions, and sends the correct responses.
- INTERFACES** The shared object libssagent.so.1 provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

MT-Level	Unsafe

- SEE ALSO** [intro\(3\)](#), [libssasnm\(3LIB\)](#), [attributes\(5\)](#)

**NAME** libssasmp – Sun Solstice Enterprise SNMP library

**SYNOPSIS** `cc [ flag... ] file... -lssasmp [ library.. ]`

**DESCRIPTION** The libssasmp library provides low-level SNMP API functions.

- ASN.1 serialization (encoding/decoding) module
- SNMP PDU development routines
- SNMP session module
- Low level SNMP based API functions
- Error-handling module
- Trace (debugging) module

**INTERFACES** The shared object `libssasmp.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

## libtecla(3LIB)

<b>NAME</b>	libtecla – interactive command line input library																																				
<b>SYNOPSIS</b>	<pre>cc [ flag... ] file... -ltecla [ library... ] #include &lt;libtecla.h&gt;</pre>																																				
<b>DESCRIPTION</b>	This library provides programs with interactive command line editing facilities, similar to those of the UNIX <code>tcsh</code> shell. In addition to simple command-line editing, it supports recall of previously entered command lines, TAB completion of file names or other tokens, and in-line wildcard expansion of filenames. The internal functions that perform file-name completion and wild-card expansion are also available externally for optional use by the calling program.																																				
<b>Thread Safety</b>	The terminfo functions <code>setupterm(3CURSES)</code> , <code>tigetstr(3CURSES)</code> , <code>tigetnum(3CURSES)</code> , and <code>tputs(3CURSES)</code> are not reentrant. This condition, however, should not prevent use of this library in threaded applications, since few applications will want to interact with multiple terminals.																																				
<b>INTERFACES</b>	The shared object <code>libtecla.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.  <table><tr><td><code>cfc_file_start</code></td><td><code>cfc_literal_escapes</code></td></tr><tr><td><code>cfc_set_check_fn</code></td><td><code>cpl_add_completion</code></td></tr><tr><td><code>cpl_check_exe</code></td><td><code>cpl_complete_word</code></td></tr><tr><td><code>cpl_file_completions</code></td><td><code>cpl_last_error</code></td></tr><tr><td><code>cpl_list_completions</code></td><td><code>cpl_recall_matches</code></td></tr><tr><td><code>cpl_record_error</code></td><td><code>del_CplFileConf</code></td></tr><tr><td><code>del_ExpandFile</code></td><td><code>del_GetLine</code></td></tr><tr><td><code>del_PathCache</code></td><td><code>del_PcaPathConf</code></td></tr><tr><td><code>del_WordCompletion</code></td><td><code>ef_expand_file</code></td></tr><tr><td><code>ef_last_error</code></td><td><code>ef_list_expansions</code></td></tr><tr><td><code>gl_abandon_line</code></td><td><code>gl_append_history</code></td></tr><tr><td><code>gl_automatic_history</code></td><td><code>gl_bind_keyseq</code></td></tr><tr><td><code>gl_catch_blocked</code></td><td><code>gl_change_terminal</code></td></tr><tr><td><code>gl_clear_history</code></td><td><code>gl_completion_action</code></td></tr><tr><td><code>gl_configure_getline</code></td><td><code>gl_customize_completion</code></td></tr><tr><td><code>gl_display_text</code></td><td><code>gl_echo_mode</code></td></tr><tr><td><code>gl_erase_terminal</code></td><td><code>gl_error_message</code></td></tr><tr><td><code>gl_get_line</code></td><td><code>gl_group_history</code></td></tr></table>	<code>cfc_file_start</code>	<code>cfc_literal_escapes</code>	<code>cfc_set_check_fn</code>	<code>cpl_add_completion</code>	<code>cpl_check_exe</code>	<code>cpl_complete_word</code>	<code>cpl_file_completions</code>	<code>cpl_last_error</code>	<code>cpl_list_completions</code>	<code>cpl_recall_matches</code>	<code>cpl_record_error</code>	<code>del_CplFileConf</code>	<code>del_ExpandFile</code>	<code>del_GetLine</code>	<code>del_PathCache</code>	<code>del_PcaPathConf</code>	<code>del_WordCompletion</code>	<code>ef_expand_file</code>	<code>ef_last_error</code>	<code>ef_list_expansions</code>	<code>gl_abandon_line</code>	<code>gl_append_history</code>	<code>gl_automatic_history</code>	<code>gl_bind_keyseq</code>	<code>gl_catch_blocked</code>	<code>gl_change_terminal</code>	<code>gl_clear_history</code>	<code>gl_completion_action</code>	<code>gl_configure_getline</code>	<code>gl_customize_completion</code>	<code>gl_display_text</code>	<code>gl_echo_mode</code>	<code>gl_erase_terminal</code>	<code>gl_error_message</code>	<code>gl_get_line</code>	<code>gl_group_history</code>

**FILES** `/usr/lib/libtnfctl.so.1` shared object  
`/usr/lib/64/libtnfctl.so.1` 64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWtnfc (32-bit) SUNWtnfcx (64-bit)
MT-Level	MT-Safe with exceptions

**SEE ALSO** [pvs\(1\)](#), [intro\(3\)](#), [libtnfctl\(3TNF\)](#), [tracing\(3TNF\)](#), [attributes\(5\)](#)

**NOTES** | This API is MT-Safe. Multiple threads can concurrently operate on independent `tnfctl` handles, which is the typical behavior expected. `libtnfctl` does not support multiple threads operating on the same `tnfctl` handle. If this is desired, it is the client's responsibility to implement locking to ensure that two threads that use the same `tnfctl` handle are not simultaneously present in a `libtnfctl` interface.

## libucb(3LIBUCB)

<b>NAME</b>	libucb – UCB source compatibility library
<b>SYNOPSIS</b>	<pre>cc [ <i>flag...</i> ] -I /usr/ucbinclude <i>file...</i> -L /usr/libucb \ -R /usr/ucblib -lucb [ <i>library...</i> ]</pre>
<b>DESCRIPTION</b>	Functions in this library provide UCB source compatibility.
<b>INTERFACES</b>	The shared object <code>libucb.so.1</code> provides the public interfaces defined below. See <a href="#">intro(3)</a> for additional information on shared object interfaces.

alphasort	bcmp	bcopy
bzero	flock	fopen
fprintf	freopen	fstatfs
ftime	getdtablesize	gethostid
gethostname	getpagesize	getrusage
gettimeofday	getwd	index
killpg	longjmp	mctl
nice	nlist	printf
psignal	rand	re_comp
re_exec	readdir	reboot
rindex	scandir	setbuffer
sethostname	setjmp	setlinebuf
setpgrp	settimeofday	sigblock
siginterrupt	signal	sigpause
sigsetmask	sigstack	sigvec
sigvechandler	sleep	sprintf
srand	statfs	sys_siglist
times	ualarm	usignal
usigpause	usleep	vfprintf
vprintf	vsprintf	wait3
wait4		

The following interfaces are unique to the 32-bit version of this library:

alphasort64                    fopen64                    freopen64  
 readdir64                    scandir64

**FILES** /usr/ucblib/libucb.so.1                    shared object  
 /usr/ucblib/64/libucb.so.1                    64-bit shared object

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWscpu, SUNWsra (32-bit) SUNWscpux (64-bit)
MT-Level	Safe with exceptions

**SEE ALSO** pvs(1), [intro\(3\)](#), attributes(5)

libumem(3LIB)

**NAME** libumem – object-caching memory allocation library

**SYNOPSIS** `cc [ flag... ] file... -lumem [ library... ]  
#include <umem.h>`

**DESCRIPTION** Functions in this library provide fast, scalable object-caching memory allocation with multithreaded application support. In addition to the standard `malloc(3C)` family of functions and the more flexible `umem_alloc(3MALLOC)` family, `libumem` provides powerful object-caching services as described in `umem_cache_create(3MALLOC)`.

The `libumem` library also provides extensive debugging support, including detection of memory leaks, buffer overruns, multiple frees, use of uninitialized data, use of freed data, and many other common programming errors. See `umem_debug(3MALLOC)`.

**INTERFACES** The shared object `libumem.so.1` provides the public interfaces defined below. See [intro\(3\)](#) for additional information on shared object interfaces.

<code>calloc</code>	<code>free</code>
<code>malloc</code>	<code>memalign</code>
<code>realloc</code>	<code>umem_alloc</code>
<code>umem_cache_alloc</code>	<code>umem_cache_create</code>
<code>umem_cache_destroy</code>	<code>umem_cache_free</code>
<code>umem_free</code>	<code>umem_nofail_callback</code>
<code>umem_zalloc</code>	<code>valloc</code>

**FILES** `/usr/lib/libumem.so.1` shared object  
`/usr/lib/64/libumem.so.1` 64-bit shared object

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Availability	SUNWcsl (32-bit) SUNWcslx (64-bit)
Interface Stability	Evolving
MT-Level	MT-Safe

**SEE ALSO** [intro\(3\)](#), [malloc\(3C\)](#), [umem\\_alloc\(3MALLOC\)](#), [umem\\_cache\\_create\(3MALLOC\)](#), [umem\\_debug\(3MALLOC\)](#), [attributes\(5\)](#)

**NAME** libusb – user-space USB device management library

**SYNOPSIS**

```
cc [ flag... ] -I/usr/sfw/include file... -L/usr/sfw/lib -R /usr/sfw/lib \
-lusb [ library... ]
#include <usb.h>
```

**DESCRIPTION** The libusb library contains interfaces for managing USB devices without a kernel driver. It is an open-source API supported on Linux, MacOS X, and NetBSD. See <http://libusb.sourceforge.net>.

The current implementation is version 0.1.8 of the libusb API.

Complete documentation for this library can be found at </usr/sfw/share/doc/libusb/libusb.txt>.

**INTERFACES** The shared object `libusb.so.1` provides the following public interfaces. See [intro\(3\)](#) for additional information on shared object interfaces.

<code>usb_bulk_read</code>	<code>usb_bulk_write</code>
<code>usb_claim_interface</code>	<code>usb_clear_halt</code>
<code>usb_close</code>	<code>usb_control_msg</code>
<code>usb_find_busses</code>	<code>usb_find_devices</code>
<code>usb_get_busses</code>	<code>usb_get_descriptor_by_endpoint</code>
<code>usb_get_descriptor</code>	<code>usb_get_string</code>
<code>usb_get_string_simple</code>	<code>usb_init</code>
<code>usb_interrupt_read</code>	<code>usb_interrupt_write</code>
<code>usb_open</code>	<code>usb_release_interface</code>
<code>usb_reset</code>	<code>usb_resetep</code>
<code>usb_set_altinterface</code>	<code>usb_set_configuration</code>
<code>usb_set_debug</code>	<code>usb_strerror</code>

**FILES**

<code>/usr/sfw/lib/libusb.so.1</code>	shared object
<code>/usr/sfw/lib/libusb_plugins</code>	implementation-specific libusb modules
<code>/usr/sfw/bin/libusb-config</code>	script to determine linking environment

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

<b>NAME</b>	limits.h, limits – implementation-defined constants
<b>SYNOPSIS</b>	<code>#include &lt;limits.h&gt;</code>
<b>DESCRIPTION</b>	<p>The <code>&lt;limits.h&gt;</code> header defines various symbolic names. Different categories of names are described below.</p> <p>The names represent various limits on resources that the implementation imposes on applications. Symbolic constant names beginning with <code>_POSIX</code> can be found in <a href="#">unistd.h(3HEAD)</a>.</p> <p>Applications should not assume any particular value for a limit. An application wishing to avail itself of the full amount of a resource available on an implementation can make use of the value given in <code>limits.h</code> on that particular implementation by using the symbolic names listed below. Many of the listed limits are not invariant, and at runtime, the value of the limit might differ from those given in this header, for the following reasons:</p> <ul style="list-style-type: none"> <li>■ The limit is pathname-dependent.</li> <li>■ The limit differs between the compile and runtime machines.</li> </ul> <p>For these reasons, an application can use the <code>fpathconf(2)</code>, <code>pathconf(2)</code>, and <code>sysconf(3C)</code> functions to determine the actual value of a limit at runtime.</p>
<b>Runtime Invariant Values (Possibly Indeterminate)</b>	<p><b>AIO_LISTIO_MAX</b> Maximum number of I/O operations in a single list I/O call supported by the implementation.</p> <p><b>AIO_MAX</b> Maximum number of outstanding asynchronous I/O operations supported by the implementation.</p> <p><b>AIO_PRIO_DELTA_MAX</b> The maximum amount by which a process can decrease its asynchronous I/O priority level from its own scheduling priority.</p> <p><b>ARG_MAX</b> Maximum length of argument to the <code>exec(2)</code> functions including environment data.</p> <p><b>ATEXIT_MAX</b> Maximum number of functions that can be registered with <code>atexit(3C)</code>.</p> <p><b>CHILD_MAX</b> Maximum number of simultaneous processes per real user ID.</p> <p><b>CLK_TCK</b> Number of clock ticks per second returned by the <code>times(2)</code> function.</p> <p><b>DELAYTIMER_MAX</b> Maximum number of timer expiration overruns.</p> <p><b>HOST_NAME_MAX</b> Maximum length of a host name (not including the terminating null) as returned from the <code>gethostname(3C)</code> function.</p>

## limits.h(3HEAD)

IOV_MAX	Maximum number of <code>iovec</code> structures that one process has available for use with <code>readv(2)</code> or <code>writenv(2)</code> .
LOGIN_NAME_MAX	Maximum length of a login name.
MQ_OPEN_MAX	The maximum number of open message queue descriptors a process is allowed to hold.
LOGIN_NAME_MAX	Maximum length of a login name.
MQ_OPEN_MAX	The maximum number of open message queue descriptors a process is allowed to hold.
MQ_PRIO_MAX	The maximum number of message priorities supported by the implementation.
OPEN_MAX	Maximum number of files that one process can have open at any one time.
PAGESIZE	Size in bytes of a page.
PAGE_SIZE	Equivalent to <code>PAGESIZE</code> . If either <code>PAGESIZE</code> or <code>PAGE_SIZE</code> is defined, the other is defined with the same value.
PASS_MAX	The maximum number of significant bytes in a password, not including the terminating null.
PTHREAD_DESTRUCTOR_ITERATIONS	Maximum number of attempts made to destroy a thread's thread-specific data values on thread exit.
PTHREAD_KEYS_MAX	Maximum number of data keys that can be created by a process.
PTHREAD_STACK_MIN	Minimum size in bytes of thread stack storage.
PTHREAD_THREADS_MAX	Maximum number of threads that can be created per process.
RE_DUP_MAX	The number of repeated occurrences of a BRE permitted by the <code>regexec(3C)</code> and <code>regcomp(3C)</code> functions when using the interval notation <code>{\(<i>m</i>,<i>n</i>\)}</code> .
RTSIG_MAX	Maximum number of realtime signals reserved for application use in this implementation.

SEM_NSEMS_MAX	Maximum number of semaphores that a process can have.
SEM_VALUE_MAX	The maximum value a semaphore can have.
SIGQUEUE_MAX	Maximum number of queued signals that a process can send and have pending at the receiver(s) at any time.
SS_REPL_MAX	The maximum number of replenishment operations that may be simultaneously pending for a particular sporadic server scheduler.
STREAM_MAX	The number of streams that one process can have open at one time. If defined, it has the same value as FOPEN_MAX.
SYMLOOP_MAX	Maximum number of symbolic links that can be reliably traversed in the resolution of a pathname in the absence of a loop.
TIMER_MAX	Maximum number of timers per process supported by the implementation.
TRACE_EVENT_NAME_MAX	Maximum length of the trace event name.
TRACE_NAME_MAX	Maximum length of the trace generation version string or of the trace stream name.
TRACE_SYS_MAX	Maximum number of trace streams that may simultaneously exist in the system.
TRACE_USER_EVENT_MAX	Maximum number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event <code>POSIX_TRACE_UNNAMED_USER_EVENT</code> .
TTY_NAME_MAX	Maximum length of terminal device name.
TZNAME_MAX	Maximum number of bytes supported for the name of a timezone (not of the TZ variable).
<b>Pathname Variable Values</b>	The values in the following list can be constants within an implementation or can vary from one pathname to another. For example, file systems or directories can have different characteristics. The value supported for a specific pathname is provided by the <code>pathconf(2)</code> function.
FILESIZEBITS	Minimum number of bits needed to represent, as a signed integer value, the maximum size of a regular file allowed in the specified directory.

## limits.h(3HEAD)

LINK_MAX	Maximum number of links to a single file.
MAX_CANON	Maximum number of bytes in a terminal canonical input line.
MAX_INPUT	Minimum number of bytes for which space is available in a terminal input queue; therefore, the maximum number of bytes a conforming application may require to be typed as input before reading them.
NAME_MAX	Maximum number of bytes in a filename (not including terminating null).
PATH_MAX	Maximum number of bytes in a pathname, including the terminating null character.
PIPE_BUF	Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
POSIX_ALLOC_SIZE_MIN	Minimum number of bytes of storage actually allocated for any portion of a file.
POSIX_REC_INCR_XFER_SIZE	Recommended increment for file transfer sizes between the POSIX_REC_MIN_XFER_SIZE and POSIX_REC_MAX_XFER_SIZE values.
POSIX_REC_MAX_XFER_SIZE	Maximum recommended file transfer size.
POSIX_REC_MIN_XFER_SIZE	Minimum recommended file transfer size.
POSIX_REC_XFER_ALIGN	Recommended file transfer buffer alignment.
SYMLINK_MAX	Maximum number of bytes in a symbolic link.
<b>Runtime Inceasable Values</b>	The magnitude limitations in the following list are fixed by specific implementations. An application should assume that the value supplied by <code>&lt;limits.h&gt;</code> in a specific implementation is the minimum that pertains whenever the application is run under that implementation. A specific instance of a specific implementation can increase the value relative to that supplied by <code>&lt;limits.h&gt;</code> for that implementation. The actual value supported by a specific instance is provided by the <code>sysconf(3C)</code> function.
BC_BASE_MAX	Maximum obase values allowed by the <code>bc(1)</code> utility.
BC_DIM_MAX	Maximum number of elements permitted in an array by the <code>bc</code> utility.
BC_SCALE_MAX	Maximum scale value allowed by the <code>bc</code> utility.

<code>BC_STRING_MAX</code>	Maximum length of a string constant accepted by the <code>bc</code> utility.
<code>CHARCLASS_NAME_MAX</code>	Maximum number of bytes in a character class name.
<code>COLL_WEIGHTS_MAX</code>	Maximum number of weights that can be assigned to an entry of the <code>LC_COLLATE</code> order keyword in the locale definition file.
<code>EXPR_NEST_MAX</code>	Maximum number of expressions that can be nested within parentheses by the <code>expr(1)</code> utility.
<code>EXPR_NEST_MAX</code>	Maximum number of expressions that can be nested within parentheses by the <code>expr</code> utility.
<code>LINE_MAX</code>	Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <code>&lt;newline&gt;</code> .
<code>NGROUPS_MAX</code>	Maximum number of simultaneous supplementary group IDs per process.
<code>RE_DUP_MAX</code>	Maximum number of repeated occurrences of a regular expression permitted when using the interval notation <code>\{m,n\}</code> .

**Maximum Values** The symbolic constants in the following list are symbolic names for the most restrictive value for certain features on an implementation supporting the POSIX Timers option.

<code>_POSIX_CLOCKRES_MIN</code>	The resolution of the <code>CLOCK_REALTIME</code> clock, in nanoseconds.
----------------------------------	--

**Minimum Values** The symbolic constants in the following list are symbolic names for the most restrictive value for certain features on an implementation conforming to various POSIX and Single Unix Specification requirements. See `standards(5)`.

<code>_POSIX_AIO_LISTIO_MAX</code>	The number of I/O operations that can be specified in a list I/O call.
<code>_POSIX_AIO_MAX</code>	The number of outstanding asynchronous I/O operations.
<code>_POSIX_ARG_MAX</code>	Maximum length of argument to the <code>exec(2)</code> functions including environment data.
<code>_POSIX_CHILD_MAX</code>	Maximum number of simultaneous processes per real user ID.

## limits.h(3HEAD)

`_POSIX_DELAYTIMER_MAX`  
The number of timer expiration overruns.

`_POSIX_HOST_NAME_MAX`  
Maximum length of a host name (not including the terminating null) as returned from the `gethostname(3C)` function.

`_POSIX_LINK_MAX`  
Maximum number of links to a single file.

`_POSIX_LOGIN_NAME_MAX`  
The size of the storage required for a login name, in bytes, including the terminating null.

`_POSIX_MAX_CANON`  
Maximum number of bytes in a terminal canonical input queue.

`_POSIX_MAX_INPUT`  
Maximum number of bytes allowed in a terminal input queue.

`_POSIX_MQ_OPEN_MAX`  
The number of message queues that can be open for a single process.

`_POSIX_MQ_PRIO_MAX`  
The maximum number of message priorities supported by the implementation.

`_POSIX_NAME_MAX`  
Maximum number of bytes in a filename (not including terminating null).

`_POSIX_NGROUPS_MAX`  
Maximum number of simultaneous supplementary group IDs per process.

`_POSIX_OPEN_MAX`  
Maximum number of files that one process can have open at any one time.

`_POSIX_PATH_MAX`  
Maximum number of bytes in a pathname.

`_POSIX_PIPE_BUF`  
Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.

`_POSIX_RE_DUP_MAX`  
The number of repeated occurrences of a BRE permitted by the `regexexec()` and `regcomp()` functions when using the interval notation `{\(m,n\}`

`_POSIX_RTSIG_MAX`  
The number of realtime signal numbers reserved for application use.

`_POSIX_SEM_NSEMS_MAX`  
The number of semaphores that a process can have.

`_POSIX_SEM_VALUE_MAX`  
The maximum value a semaphore can have.

`_POSIX_SIGQUEUE_MAX`  
The number of queued signals that a process can send and have pending at the receiver(s) at any time.

```

__POSIX_SSIZE_MAX
    The value that can be stored in an object of type ssize_t.

__POSIX_STREAM_MAX
    The number of streams that one process can have open at one time.

__POSIX_SS_REPL_MAX
    The number of replenishment operations that can be simultaneously pending for a
    particular sporadic server scheduler.

__POSIX_SYMLINK_MAX
    The number of bytes in a symbolic link.

__POSIX_SYMLINK_MAX
    The number of symbolic links that can be traversed in the resolution of a pathname
    in the absence of a loop.

__POSIX_THREAD_DESTRUCTOR_ITERATIONS
    The number of attempts made to destroy a thread's thread-specific data values on
    thread exit.

__POSIX_THREAD_KEYS_MAX
    The number of data keys per process.

__POSIX_THREAD_THREADS_MAX
    The number of threads per process.

__POSIX_TIMER_MAX
    The per-process number of timers.

__POSIX_TRACE_EVENT_NAME_MAX
    The length in bytes of a trace event name.

__POSIX_TRACE_NAME_MAX
    The length in bytes of a trace generation version string or a trace stream name.

__POSIX_TRACE_SYS_MAX
    The number of trace streams that can simultaneously exist in the system.

__POSIX_TRACE_USER_EVENT_MAX
    The number of user trace event type identifiers that may simultaneously exist in a
    traced process, including the predefined user trace event
    POSIX_TRACE_UNNAMED_USER_EVENT.

__POSIX_TTY_NAME_MAX
    The size of the storage required for a terminal device name, in bytes, including the
    terminating null.

__POSIX_TZNAME_MAX
    Maximum number of bytes supported for the name of a timezone (not of the TZ
    variable).

__POSIX2_BC_BASE_MAX
    Maximum obase values allowed by the bc utility.

```

## limits.h(3HEAD)

- `_POSIX2_BC_DIM_MAX`  
Maximum number of elements permitted in an array by the `bc` utility.
- `_POSIX2_BC_SCALE_MAX`  
Maximum scale value allowed by the `bc` utility.
- `_POSIX2_BC_STRING_MAX`  
Maximum length of a string constant accepted by the `bc` utility.
- `_POSIX2_CHARCLASS_NAME_MAX`  
Maximum number of bytes in a character class name.
- `_POSIX2_COLL_WEIGHTS_MAX`  
Maximum number of weights that can be assigned to an entry of the `LC_COLLATE` order keyword in the locale definition file.
- `_POSIX2_EXPR_NEST_MAX`  
Maximum number of expressions that can be nested within parentheses by the `expr` utility.
- `_POSIX2_LINE_MAX`  
Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing `<newline>`.
- `_POSIX2_RE_DUP_MAX`  
Maximum number of repeated occurrences of a regular expression permitted when using the interval notation `\{m,n\}`.
- `_XOPEN_IOV_MAX`  
Maximum number of `iovec` structures that one process has available for use with `readv(2)` or `writev(2)`.
- `_XOPEN_NAME_MAX`  
Maximum number of bytes in a filename (not including the terminating null).
- `_XOPEN_PATH_MAX`  
Maximum number of bytes in a pathname.

### Numerical Limits

The values in the following lists shall be defined in `<limits.h>` and are constant expressions suitable for use in `#if` preprocessing directives. Moreover, except for `CHAR_BIT`, `DBL_DIG`, `DBL_MAX`, `FLT_DIG`, `FLT_MAX`, `LONG_BIT`, `WORD_BIT`, and `MB_LEN_MAX`, the symbolic names are defined as expressions of the correct type.

If the value of an object of type `char` is treated as a signed integer when used in an expression, the value of `CHAR_MIN` is the same as that of `SCHAR_MIN` and the value of `CHAR_MAX` is the same as that of `SCHAR_MAX`. Otherwise, the value of `CHAR_MIN` is 0 and the value of `CHAR_MAX` is the same as that of `UCHAR_MAX`.

- `CHAR_BIT`  
Number of bits in a type `char`.
- `CHAR_MAX`  
Maximum value of type `char`.

CHAR\_MIN  
Minimum value of type char.

DBL\_DIG  
Digits of precision of type double.

DBL\_MAX  
Maximum decimal value of a double.

DBL\_MIN  
Minimum decimal value of a double.

FLT\_DIG  
Digits of precision of type float.

FLT\_MAX  
Maximum decimal value of a float.

FLT\_MIN  
Minimum decimal value of a float.

INT\_MIN  
Minimum value of type int.

INT\_MAX  
Maximum value of an int.

LLONG\_MIN  
Minimum value of type long long.

LLONG\_MAX  
Maximum value of type long long.

LONG\_BIT  
Number of bits in a long.

LONG\_MIN  
Minimum value of type long.

LONG\_MAX  
Maximum value of a long.

MB\_LEN\_MAX  
Maximum number of bytes in a character, for any supported locale.

SCHAR\_MIN  
Minimum value of type signed char.

SCHAR\_MAX  
Maximum value of type signed char.

SHRT\_MIN  
Minimum value of type short.

SHRT\_MAX  
Maximum value of type short.

## limits.h(3HEAD)

SSIZE_MAX	Maximum value of an object of type <code>ssize_t</code> .
TMP_MAX	Minimum number of unique filename generated by <code>tmpnam(3C)</code> . Maximum number of times an application can call <code>tmpnam()</code> reliably.
UCHAR_MAX	Maximum value of type <code>unsigned char</code> .
UINT_MAX	Maximum value of type <code>unsigned</code> .
ULLONG_MAX	Maximum value of type <code>unsigned long long</code> .
ULONG_MAX	Maximum value of type <code>unsigned long</code> .
USHRT_MAX	Maximum value for a type <code>unsigned short</code> .
WORD_BIT	Number of bits in a word or type <code>int</code> .

### Other Invariant Values

The following constants are defined in `<limits.h>`.

CHARCLASS_NAME_MAX	Maximum number of bytes in a character class name.
LOGNAME_MAX	The maximum number of bytes supported in a user's login name.
NL_ARGMAX	Maximum value of digit in calls to the <code>printf(3C)</code> and <code>scanf(3C)</code> functions.
NL_LANGMAX	Maximum number of bytes in a LANG name.
NL_MSGMAX	Maximum message number.
NL_NMAX	Maximum number of bytes in an N-to-1 collation mapping.
NL_SETMAX	Maximum set number.
NL_TEXTMAX	Maximum number of bytes in a message string.
NZERO	Default process priority.

<b>NAME</b>	math.h, math – mathematical declarations
<b>SYNOPSIS</b>	<code>#include &lt;math.h&gt;</code>
<b>DESCRIPTION</b>	<p>The <code>&lt;math.h&gt;</code> header includes definitions for the following types:</p> <p><code>float_t</code>            A real-floating type at least as wide as <code>float</code>.</p> <p><code>double_t</code>            A real-floating type at least as wide as <code>double</code>, and at least as wide as <code>float_t</code>.</p> <p>If <code>FLT_EVAL_METHOD</code> equals 0, <code>float_t</code> and <code>double_t</code> are <code>float</code> and <code>double</code>, respectively. If <code>FLT_EVAL_METHOD</code> equals 1, they are both <code>double</code>. If <code>FLT_EVAL_METHOD</code> equals 2, they are both be long <code>double</code>. Other values of <code>FLT_EVAL_METHOD</code> are implementation-defined.</p> <p>The <code>&lt;math.h&gt;</code> header provides the following constants. The values are of type <code>double</code> and are accurate within the precision of the <code>double</code> type.</p> <p><code>M_E</code>                    The base of natural logarithms (<math>e</math>).</p> <p><code>M_LOG2E</code>              The base-2 logarithm of <math>e</math>.</p> <p><code>M_LOG10E</code>             The base-10 logarithm of <math>e</math>.</p> <p><code>M_LN2</code>                 The natural logarithm of 2.</p> <p><code>M_LN10</code>                The natural logarithm of 10.</p> <p><code>M_PI</code>                  <math>\pi</math>, the ratio of the circumference of a circle to its diameter.</p> <p><code>M_PI_2</code>                <math>\pi/2</math>.</p> <p><code>M_PI_4</code>                <math>\pi/4</math>.</p> <p><code>M_1_PI</code>                <math>1/\pi</math>.</p> <p><code>M_2_PI</code>                <math>2/\pi</math>.</p> <p><code>M_2_SQRTPI</code>            2 over the square root of <math>\pi</math>.</p> <p><code>M_SQRT2</code>              The positive square root of 2.</p> <p><code>M_SQRT1_2</code>             The positive square root of <math>1/2</math>.</p> <p>The <code>&lt;math.h&gt;</code> header defines the following symbolic constants:</p> <p><code>MAXFLOAT</code>              The maximum value of a non-infinite single-precision floating point number.</p> <p><code>HUGE_VAL</code>              A positive <code>double</code> expression, not necessarily representable as a <code>float</code>. Used as an error value returned by the mathematics library. <code>HUGE_VAL</code> evaluates to <code>+infinity</code> on systems supporting IEEE Std 754-1985.</p>

## math.h(3HEAD)

HUGE_VALF	A positive <code>float</code> constant expression. Used as an error value returned by the mathematics library. <code>HUGE_VALF</code> evaluates to +infinity on systems supporting IEEE Std 754-1985.
HUGE_VALL	A positive <code>long double</code> constant expression. Used as an error value returned by the mathematics library. <code>HUGE_VALL</code> evaluates to +infinity on systems supporting IEEE Std 754-1985.
INFINITY	A constant expression of type <code>float</code> representing positive or unsigned infinity, if available; else a positive constant of type <code>float</code> that overflows at translation time.
NAN	A constant expression of type <code>float</code> representing a quiet NaN. This symbolic constant is only defined if the implementation supports quiet NaNs for the <code>float</code> type.

The following macros are defined for number classification. They represent the mutually-exclusive kinds of floating-point values. They expand to integer constant expressions with distinct values

```
FP_INFINITE
FP_NAN
FP_NORMAL
FP_SUBNORMAL
FP_ZERO
```

The following optional macros indicate whether the `fma()` family of functions are fast compared with direct code:

```
FP_FAST_FMA
FP_FAST_FMAF
FP_FAST_FMAL
```

The `FP_FAST_FMA` macro is defined to indicate that the `fma()` function generally executes about as fast as, or faster than, a multiply and an add of `double` operands. The other macros have the equivalent meaning for the `float` and `long double` versions.

The following macros expand to integer constant expressions whose values are returned by `ilogb(x)` if `x` is zero or NaN, respectively. The value of `FP_ILOGB0` is either `{INT_MIN}` or `-{INT_MAX}`. The value of `FP_ILOGBNAN` is either `{INT_MAX}` or `{INT_MIN}`.

```
FP_ILOGB0
FP_ILOGBNAN
```

The following macros expand to the integer constants 1 and 2, respectively:

```
MATH_ERRNO
MATH_ERREXCEPT
```

The following macro expands to an expression that has type `int` and the value `MATH_ERREXCEPT`:

`math_errhandling`

The value of the macro `math_errhandling` is constant for the duration of the program. If a macro definition is suppressed or a program defines an identifier with the name `math_errhandling`, the behavior is undefined.

The `<math.h>` header defines the following external variable:

```
extern int signgam;
```

The `<math.h>` header defines the structure and constants used by the `matherr(3M)` error-handling mechanisms.

monetary.h(3HEAD)

**NAME** | monetary.h, monetary – monetary types

**SYNOPSIS** | #include <monetary.h>

**DESCRIPTION** | The <monetary.h> header defines the following types:  
size\_t           As described in [stddef.h\(3HEAD\)](#).  
ssize\_t           As described in [types.h\(3HEAD\)](#).

**ATTRIBUTES** | See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** | [stddef.h\(3HEAD\)](#), [strfmon\(3C\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

<b>NAME</b>	mqueue.h, mqueue – message queues				
<b>SYNOPSIS</b>	<code>#include &lt;mqueue.h&gt;</code>				
<b>DESCRIPTION</b>	<p>The <code>&lt;mqueue.h&gt;</code> header defines the <code>mqd_t</code> type, which is used for message queue descriptors. This will not be an array type. A message queue descriptor may be implemented using a file descriptor, in which case applications can open up to at least <code>OPEN_MAX</code> file and message queues.</p> <p>The <code>&lt;mqueue.h&gt;</code> header defines the <code>sigevent</code> structure (as described in <code>&lt;signal.h&gt;</code>, see <a href="#">signal.h(3HEAD)</a>) and the <code>mq_attr</code> structure, which is used in getting and setting the attributes of a message queue. Attributes are initially set when the message queue is created. A <code>mq_attr</code> structure has the following members:</p> <pre> long    mq_flags      message queue flags long    mq_maxmsg     maximum number of messages long    mq_msgsize    maximum message size long    mq_curmsgs    number of messages currently queued </pre> <p>Inclusion of the <code>&lt;mqueue.h&gt;</code> header may make visible symbols defined in the headers <code>&lt;fcntl.h&gt;</code>, <code>&lt;signal.h&gt;</code>, <code>&lt;sys/types.h&gt;</code>, and <code>&lt;time.h&gt;</code>.</p>				
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Interface Stability</td> <td>Standard</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard

**NAME** ndbm.h, ndbm – definitions for ndbm database operations

**SYNOPSIS** `#include <ndbm.h>`

**DESCRIPTION** The `<ndbm.h>` header defines the `datum` type as a structure that includes at least the following members:

```
void    *dptr    /* pointer to the application's data */
size_t  dsize    /* size of the object pointed to by dptr */
```

The `size_t` type is defined through `typedef` as described in `<stddef.h>`.

The `<ndbm.h>` header defines the `DBM` type through `typedef`.

The following constants are defined as possible values for the `store_mode` argument to `dbm_store()`:

`DBM_INSERT`      Insertion of new entries only.

`DBM_REPLACE`     Allow replacing existing entries.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** `ndbm(3C)`, `attributes(5)`, `standards(5)`

netdb.h(3HEAD)

<b>NAME</b>	netdb.h, netdb – definitions for network database operations
<b>SYNOPSIS</b>	<pre>#include &lt;netdb.h&gt;</pre>
<b>DESCRIPTION</b>	<p>The &lt;netdb.h&gt; header defines the type <code>in_port_t</code> and the type <code>in_addr_t</code> as described in <a href="#">in.h(3HEAD)</a>.</p> <p>The &lt;netdb.h&gt; header defines the <code>hostent</code> structure that includes the following members:</p> <pre>char *h_name          /* official name of the host */ char **h_aliases      /* pointer to an array of pointers to alternative */                     /* host names, terminated by a null pointer */ int  h_addrtype       /* address type */ int  h_length         /* length, in bytes, of the address */ char **h_addr_list    /* pointer to an array of pointers to network addresses */                     /* (in network byte order) for the host, terminated by a */                     /* null pointer */</pre> <p>The &lt;netdb.h&gt; header defines the <code>netent</code> structure that includes the following members:</p> <pre>char *n_name          /* official, fully-qualified (including the domain) name */                     /* of the network */ char **n_aliases      /* pointer to an array of pointers to alternative */                     /* network names, terminated by a null pointer */ int   n_addrtype      /* the address type of the network */ in_addr_t n_net       /* the network number, in host byte order */</pre> <p>The &lt;netdb.h&gt; header defines the <code>protoent</code> structure that includes the following members:</p> <pre>char *p_name          /* official name of the protocol */ char **p_aliases      /* pointer to an array of pointers to alternative */                     /* protocol names, terminated by a null pointer */ int   p_proto         /* protocol number */</pre> <p>The &lt;netdb.h&gt; header defines the <code>servent</code> structure that includes the following members:</p> <pre>char *s_name          /* official name of the service */ char **s_aliases      /* pointer to an array of pointers to alternative */                     /* service names, terminated by a null pointer */ int   s_port          /* port number at which the service resides, */                     /* in network byte order */ char *s_proto         /* name of the protocol to use when */                     /* contacting the service */</pre> <p>The &lt;netdb.h&gt; header defines the macro <code>IPPORT_RESERVED</code> with the value of the highest reserved Internet port number.</p> <p>The &lt;netdb.h&gt; header provides a declaration for <code>h_errno</code>:</p> <pre>extern int h_errno;</pre>

The <netdb.h> header defines the following macros for use as error values for `gethostbyaddr()` and `gethostbyname()`:

```
HOST_NOT_FOUND      NO_DATA
NO_RECOVERY         TRY_AGAIN
```

Inclusion of the <netdb.h> header may also make visible all symbols from [in.h\(3HEAD\)](#).

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** [intro\(3\)](#), [endhostent\(3NSL\)](#), [endhostent\(3XNET\)](#), [endnetent\(3SOCKET\)](#), [endnetent\(3XNET\)](#), [endprotoent\(3SOCKET\)](#), [endprotoent\(3XNET\)](#), [endservent\(3SOCKET\)](#), [endservent\(3XNET\)](#), [in.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

## nl\_types.h(3HEAD)

<b>NAME</b>	nl_types.h, nl_types – native language data types
<b>SYNOPSIS</b>	#include <nl_types.h>
<b>DESCRIPTION</b>	<p>This header contains the following definitions:</p> <p>nl_catd           Used by the message catalog functions <code>catopen</code>, <code>catgets</code> and <code>catclose</code> to identify a catalog.</p> <p>nl_item           Used by <code>nl_langinfo</code> to identify items of <code>langinfo</code> data. Values for objects of type <code>nl_item</code> are defined in <code>&lt;langinfo.h&gt;</code>.</p> <p>NL_SETD           Used by <code>gencat</code> when no <code>\$set</code> directive is specified in a message text source file. This constant can be used in subsequent calls to <code>catgets</code> as the value of the set identifier parameter.</p> <p>NL_MGSMAX         Maximum number of messages per set.</p> <p>NL_SETMAX         Maximum number of sets per catalog.</p> <p>NL_TEXTMAX        Maximum size of a message.</p>
<b>SEE ALSO</b>	<code>gencat(1)</code> , <code>catgets(3C)</code> , <code>catopen(3C)</code> , <code>nl_langinfo(3C)</code> , <code>langinfo.h(3HEAD)</code>

<b>NAME</b>	poll.h, poll – definitions for the poll() function				
<b>SYNOPSIS</b>	#include <poll.h>				
<b>DESCRIPTION</b>	<p>The &lt;poll.h&gt; header defines the pollfd structure, which includes the following members:</p> <pre>int fd           the following descriptor being polled short events    the input event flags (see below) short revents   the output event flags (see below)</pre> <p>The &lt;poll.h&gt; header defines the following type through typedef:</p> <pre>nfds_t          an unsigned integer type used for the number of file descriptors</pre> <p>The implementation supports one or more programming environments in which the width of nfds_t is no greater than the width of type long. The names of these programming environments can be obtained using the confstr() function or the getconf utility. See confstr(3C) and getconf(1).</p> <p>The following symbolic constants are defined, zero or more of which can be OR'ed together to form the events or revents members in the pollfd structure:</p> <pre>POLLIN          Data other than high-priority data can be read without blocking. POLLRDNORM      Normal data can be read without blocking. POLLRDBAND      Priority data can be read without blocking. POLLPRI         High priority data can be read without blocking. POLLOUT         Normal data can be written without blocking. POLLWRNORM      Equivalent to POLLOUT. POLLWRBAND      Priority data can be written. POLLERR         An error has occurred (revents only). POLLHUP         Device has been disconnected (revents only). POLLNVAL        Invalid fd member (revents only).</pre> <p>The significance and semantics of normal, priority, and high-priority data are file and device-specific.</p>

pthread.h(3HEAD)

**NAME** pthread.h, pthread – threads

**SYNOPSIS** #include <pthread.h>

**DESCRIPTION** The <pthread.h> header defines the following symbols:

```
PTHREAD_BARRIER_SERIAL_THREAD
PTHREAD_CANCEL_ASYNCHRONOUS
PTHREAD_CANCEL_ENABLE
PTHREAD_CANCEL_DEFERRED
PTHREAD_CANCEL_DISABLE
PTHREAD_CANCELED
PTHREAD_COND_INITIALIZER
PTHREAD_CREATE_DETACHED
PTHREAD_CREATE_JOINABLE
PTHREAD_EXPLICIT_SCHED
PTHREAD_INHERIT_SCHED
PTHREAD_MUTEX_DEFAULT
PTHREAD_MUTEX_ERRORCHECK
PTHREAD_MUTEX_INITIALIZER
PTHREAD_MUTEX_NORMAL
PTHREAD_MUTEX_RECURSIVE
PTHREAD_ONCE_INIT
PTHREAD_PRIO_INHERIT
PTHREAD_PRIO_NONE
PTHREAD_PRIO_PROTECT
PTHREAD_PROCESS_SHARED
PTHREAD_PROCESS_PRIVATE
PTHREAD_SCOPE_PROCESS
PTHREAD_SCOPE_SYSTEM
```

The types listed below are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

```
pthread_attr_t
pthread_barrier_t
pthread_barrierattr_t
pthread_cond_t
pthread_condattr_t
pthread_key_t
pthread_mutex_t
pthread_mutexattr_t
pthread_once_t
pthread_rwlock_t
pthread_rwlockattr_t
pthread_spinlock_t
pthread_t
```

## pwd.h(3HEAD)

<b>NAME</b>	pwd.h, pwd – password structure				
<b>SYNOPSIS</b>	#include <pwd.h>				
<b>DESCRIPTION</b>	<p>The &lt;pwd.h&gt; header provides a definition for struct passwd, which includes the following members:</p> <pre>char *pw_name      user's login name uid_t pw_uid       numerical user ID gid_t pw_gid       numerical group ID char *pw_dir       initial working di rectory char *pw_shell     program to use as shell</pre> <p>The gid_t and uid_t types are defined as described in &lt;sys/types.h&gt;. See <a href="#">types.h(3HEAD)</a>.</p>				
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:				
	<table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Interface Stability</td><td>Standard</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard				
<b>SEE ALSO</b>	<a href="#">getpwnam(3C)</a> , <a href="#">types.h(3HEAD)</a> , <a href="#">attributes(5)</a> , <a href="#">standards(5)</a>				

<b>NAME</b>	regex.h, regex – regular expression matching types
<b>SYNOPSIS</b>	#include <regex.h>
<b>DESCRIPTION</b>	<p>The &lt;regex.h&gt; header defines the structures and symbolic constants used by the <code>regcomp()</code>, <code>regexexec()</code>, <code>regerror()</code>, and <code>regfree()</code> functions. See <code>regcomp(3C)</code>.</p> <p>The structure type <code>regex_t</code> contains the following member:</p> <pre>size_t re_nsub      number of parenthesized subexpressions</pre> <p>The type <code>size_t</code> is defined as described in &lt;sys/types.h&gt;. See <code>types.h(3HEAD)</code>.</p> <p>The type <code>regoff_t</code> is defined as a signed integer type that can hold the largest value that can be stored in either a type <code>off_t</code> or type <code>ssize_t</code>. The structure type <code>regmatch_t</code> contains the following members:</p> <pre>regoff_t rm_so      byte offset from start of string to start of substring regoff_t rm_eo      byte offset from start of string of the first character after the end                     of substring</pre> <p>Values for the <i>cflags</i> parameter to the <code>regcomp</code> function are as follows:</p> <pre>REG_EXTENDED      use extended regular expressions REG_ICASE          ignore case in match REG_NOSUB         report only success or fail in regexexec () REG_NEWLINE       change the handling of NEWLINE character</pre> <p>Values for the <i>eflags</i> parameter to the <code>regexexec()</code> function are as follows:</p> <pre>REG_NOTBOL        The circumflex character (^), when taken as a special character,                     does not match the beginning of string. REG_NOTEOL        The dollar sign (\$), when taken as a special character, does not                     match the end of string.</pre> <p>The following constants are defined as error return values:</p> <pre>REG_NOMATCH       regexexec () failed to match. REG_BADPAT        Invalid regular expression. REG_ECOLLATE      Invalid collating element referenced. REG_ECTYPE        Invalid character class type referenced. REG_EESCAPE       Trailing '\\' in pattern. REG_ESUBREG       Number in \\digit invalid or in error. REG_EBRACK        "[&amp;]" imbalance. REG_EPAREN        "\\(\\" or "\)" imbalance.</pre>

regex.h(3HEAD)

REG\_EBRACE “\{\}” imbalance.  
REG\_BADBR Content of “\{\}” invalid: not a number, number too large, more than two numbers, first larger than second.  
REG\_ERANGE Invalid endpoint in range expression.  
REG\_ESPACE Out of memory.  
REG\_BADRPT ‘?’, ‘\*’, or ‘+’ not preceded by valid regular expression.  
REG\_ENOSYS Reserved.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

<b>NAME</b>	resource.h, resource – definitions for resource operations
<b>SYNOPSIS</b>	<pre>#include &lt;sys/resource.h&gt;</pre>
<b>DESCRIPTION</b>	<p>The <code>&lt;sys/resource.h&gt;</code> header defines the symbolic constants listed below as possible values of the <i>which</i> argument of <code>getpriority()</code> and <code>setpriority()</code>. See <code>getpriority(3C)</code>.</p> <p><code>PRIO_PROCESS</code> identifies the <i>who</i> argument as a process ID</p> <p><code>PRIO_PGRP</code> identifies the <i>who</i> argument as a process group ID</p> <p><code>PRIO_USER</code> identifies the <i>who</i> argument as a user ID</p> <p>The following type is defined through <code>typedef</code>:</p> <p><code>rlim_t</code> unsigned integer type used for limit values</p> <p>The following symbolic constants are defined:</p> <p><code>RLIM_INFINITY</code> a value of <code>rlim_t</code> indicating no limit</p> <p><code>RLIM_SAVED_MAX</code> a value of type <code>rlim_t</code> indicating an unrepresentable saved hard limit</p> <p><code>RLIM_SAVED_CUR</code> a value of type <code>rlim_t</code> indicating an unrepresentable saved soft limit</p> <p>The symbolic constants listed below are defined as possible values of the <i>who</i> parameter of <code>getrusage()</code>. See <code>getrusage(3C)</code>.</p> <p><code>RUSAGE_SELF</code> returns information about the current process</p> <p><code>RUSAGE_CHILDREN</code> returns information about children of the current process</p> <p>The <code>&lt;sys/resource.h&gt;</code> header defines the <code>rlimit</code> structure, which includes the following members:</p> <pre>rlim_t rlim_cur /* the current (soft) limit */ rlim_t rlim_max /* the hard limit */</pre> <p>The <code>&lt;sys/resource.h&gt;</code> header defines the <code>rusage</code> structure, which includes the following members:</p> <pre>struct timeval ru_utime /* user time used */ struct timeval ru_stime /* system time used */</pre> <p>The <code>timeval</code> structure is defined as described in <code>&lt;sys/time.h&gt;</code>.</p> <p>The symbolic constants listed below are defined as possible values for the <i>resource</i> argument of <code>getrlimit()</code> and <code>setrlimit()</code>. See <code>getrlimit(2)</code>.</p> <p><code>RLIMIT_CORE</code> limit on size of core dump file</p> <p><code>RLIMIT_CPU</code> limit on CPU time per process</p>

resource.h(3HEAD)

RLIMIT\_DATA           limit on data segment size  
RLIMIT\_FSIZE           limit on file size  
RLIMIT\_NOFILE          limit on number of open files  
RLIMIT\_STACK           limit on stack size  
RLIMIT\_AS              limit on address space size

The `id_t` type is defined through `typedef` as described in `<sys/types.h>`. See [types.h\(3HEAD\)](#).

Inclusion of the `<sys/resource.h>` header can also make visible all symbols from `<sys/time.h>`. See [time.h\(3HEAD\)](#).

**ATTRIBUTES**    See [attributes\(5\)](#) for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO**    [getrlimit\(2\)](#), [getpriority\(3C\)](#), [time.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

<b>NAME</b>	sched.h, sched – execution scheduling								
<b>SYNOPSIS</b>	<pre>#include &lt;sched.h&gt;</pre>								
<b>DESCRIPTION</b>	<p>The <code>&lt;sched.h&gt;</code> header defines the <code>sched_param</code> structure, which contains the scheduling parameters required for implementation of each supported scheduling policy. This structure contains the following member:</p> <pre>int    sched_priority    process execution scheduling priority</pre> <p>Each process is controlled by an associated scheduling policy and priority. Associated with each policy is a priority range. Each policy definition specifies the minimum priority range for that policy. The priority ranges for each policy may overlap the priority ranges of other policies.</p> <p>The scheduling policies are indicated by the values of the following symbolic constants:</p> <table border="0"> <tr> <td style="vertical-align: top;">SCHED_FIFO</td> <td>Processes are scheduled according to the First-In-First-Out (FIFO) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will proceed until completion.</td> </tr> <tr> <td style="vertical-align: top;">SCHED_RR</td> <td>Processes are scheduled according to the Round-Robin (RR) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will execute for a time period, returned by <code>sched_rr_get_interval(3RT)</code> or by the system.</td> </tr> <tr> <td style="vertical-align: top;">SCHED_IA</td> <td>Processes are scheduled according to the Inter-Active Class (IA) policy as described in <code>prctl(2)</code>.</td> </tr> <tr> <td style="vertical-align: top;">SCHED_OTHER</td> <td>Processes are scheduled according to another policy not described above.</td> </tr> </table> <p>The values of these constants are distinct.</p> <p>Inclusion of the <code>&lt;sched.h&gt;</code> header will make visible symbols defined in the header <code>&lt;time.h&gt;</code>.</p>	SCHED_FIFO	Processes are scheduled according to the First-In-First-Out (FIFO) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will proceed until completion.	SCHED_RR	Processes are scheduled according to the Round-Robin (RR) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will execute for a time period, returned by <code>sched_rr_get_interval(3RT)</code> or by the system.	SCHED_IA	Processes are scheduled according to the Inter-Active Class (IA) policy as described in <code>prctl(2)</code> .	SCHED_OTHER	Processes are scheduled according to another policy not described above.
SCHED_FIFO	Processes are scheduled according to the First-In-First-Out (FIFO) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will proceed until completion.								
SCHED_RR	Processes are scheduled according to the Round-Robin (RR) policy. Processes scheduled to this policy, if not pre-empted by a higher priority or interrupted by a signal, will execute for a time period, returned by <code>sched_rr_get_interval(3RT)</code> or by the system.								
SCHED_IA	Processes are scheduled according to the Inter-Active Class (IA) policy as described in <code>prctl(2)</code> .								
SCHED_OTHER	Processes are scheduled according to another policy not described above.								
<b>SEE ALSO</b>	<code>prctl(2)</code> , <code>sched_rr_get_interval(3RT)</code> , <a href="#">time.h(3HEAD)</a>								

## search.h(3HEAD)

<b>NAME</b>	search.h, search – search tables				
<b>SYNOPSIS</b>	<pre>#include &lt;search.h&gt;</pre>				
<b>DESCRIPTION</b>	<p>The <code>&lt;search.h&gt;</code> header defines the <code>ENTRY</code> type for structure <code>entry</code>, which includes the following members:</p> <pre>char *key void *data</pre> <p>and defines <code>ACTION</code> and <code>VISIT</code> as enumeration data types through type definitions as follows:</p> <pre>enum { FIND, ENTER } ACTION; enum { preorder, postorder, endorder, leaf } VISIT;</pre> <p>The <code>size_t</code> type is defined as described in <code>&lt;sys/types.h&gt;</code>. See <a href="#">types.h(3HEAD)</a>.</p>				
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:				
	<table border="1"><thead><tr><th>ATTRIBUTE TYPE</th><th>ATTRIBUTE VALUE</th></tr></thead><tbody><tr><td>Interface Stability</td><td>Standard</td></tr></tbody></table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard

Interface Stability	Standard				
<b>SEE ALSO</b>	<a href="#">hsearch(3C)</a> , <a href="#">insque(3C)</a> , <a href="#">lsearch(3C)</a> , <a href="#">tsearch(3C)</a> , <a href="#">types.h(3HEAD)</a> , <a href="#">attributes(5)</a> , <a href="#">standards(5)</a>				

<b>NAME</b>	select.h, select – select types				
<b>SYNOPSIS</b>	<pre>#include &lt;sys/select.h&gt;</pre>				
<b>DESCRIPTION</b>	<p>The <code>&lt;sys/select.h&gt;</code> header defines the <code>timeval</code> structure, which includes the following members:</p> <pre>time_t      tv_sec      /* seconds */ suseconds_t tv_usec    /* microseconds */</pre> <p>The <code>time_t</code> and <code>suseconds_t</code> types are defined as described in <code>&lt;sys/types.h&gt;</code>. See <a href="#">types.h(3HEAD)</a>.</p> <p>The <code>sigset_t</code> type is defined as described in <a href="#">signal.h(3HEAD)</a>.</p> <p>The <code>timespec</code> structure is defined as described in <code>&lt;time.h&gt;</code>. See <a href="#">time.h(3HEAD)</a>.</p> <p>The <code>&lt;sys/select.h&gt;</code> header defines the <code>fd_set</code> type as a structure.</p> <p>The following is defined as a macro:</p> <pre>FD_SETSIZE    Maximum number of file descriptors in an fd_set structure.</pre> <p>Inclusion of the <code>&lt;sys/select.h&gt;</code> header can make visible all symbols from the headers <code>&lt;signal.h&gt;</code>, <code>&lt;sys/time.h&gt;</code>, and <code>&lt;time.h&gt;</code>.</p>				
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:				
	<table border="1"> <thead> <tr> <th>ATTRIBUTE TYPE</th> <th>ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Interface Stability</td> <td>Standard</td> </tr> </tbody> </table>	ATTRIBUTE TYPE	ATTRIBUTE VALUE	Interface Stability	Standard
ATTRIBUTE TYPE	ATTRIBUTE VALUE				
Interface Stability	Standard				
<b>SEE ALSO</b>	<a href="#">select(3C)</a> , <a href="#">signal.h(3HEAD)</a> , <a href="#">time.h(3HEAD)</a> , <a href="#">types.h(3HEAD)</a> , <a href="#">attributes(5)</a> , <a href="#">standards(5)</a>				

## semaphore.h(3HEAD)

<b>NAME</b>	semaphore.h, semaphore – semaphores
<b>SYNOPSIS</b>	#include <semaphore.h>
<b>DESCRIPTION</b>	<p>The &lt;semaphore.h&gt; header defines the <code>sem_t</code> type, used in performing semaphore operations. The semaphore can be implemented using a file descriptor, in which case applications are able to open up at least a total of <code>{OPEN_MAX}</code> files and semaphores. The symbol <code>SEM_FAILED</code> is defined (see <code>sem_open(3RT)</code>).</p> <p>Inclusion of the &lt;semaphore.h&gt; header can make visible symbols defined in the headers &lt;fcntl.h&gt; and &lt;sys/types.h&gt;. See <a href="#">fcntl.h(3HEAD)</a> and <a href="#">types.h(3HEAD)</a>.</p>
<b>ATTRIBUTES</b>	See <a href="#">attributes(5)</a> for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** [fcntl.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), [sem\\_destroy\(3RT\)](#), [sem\\_getvalue\(3RT\)](#), [sem\\_init\(3RT\)](#), [sem\\_open\(3RT\)](#), [sem\\_post\(3RT\)](#), [sem\\_timedwait\(3RT\)](#), [sem\\_unlink\(3RT\)](#), [sem\\_wait\(3RT\)](#), [attributes\(5\)](#), [standards\(5\)](#)

<b>NAME</b>	sem.h, sem – semaphore facility
<b>SYNOPSIS</b>	<pre>#include &lt;sys/sem.h&gt;</pre>
<b>DESCRIPTION</b>	<p>The <code>&lt;sys/sem.h&gt;</code> header defines the following constants and structures.</p> <p>Semaphore operation flags:</p> <p><code>SEM_UNDO</code>           Set up adjust on exit entry.</p> <p>Command definitions for the <code>semctl()</code> function are provided as listed below. See <code>semctl(2)</code>.</p> <p><code>GETNCNT</code>            Get <code>semncnt</code>.</p> <p><code>GETPID</code>             Get <code>sempid</code>.</p> <p><code>GETVAL</code>             Get <code>semval</code>.</p> <p><code>GETALL</code>            Get all cases of <code>semval</code>.</p> <p><code>GETZCNT</code>           Get <code>semzcnt</code>.</p> <p><code>SETVAL</code>            Set <code>semval</code>.</p> <p><code>SETALL</code>            Set all cases of <code>semval</code>.</p> <p>The <code>semid_ds</code> structure contains the following members:</p> <pre>struct ipc_perm sem_perm     /* operation permission structure */ unsigned short sem_nsems     /* number of semaphores in set */ time_t           sem_otime    /* last semop() time */ time_t           sem_ctime    /* last time changed by semctl() */</pre> <p>The <code>pid_t</code>, <code>time_t</code>, <code>key_t</code>, and <code>size_t</code> types are defined as described in <code>&lt;sys/types.h&gt;</code>. See <code>types.h(3HEAD)</code>.</p> <p>A semaphore is represented by an anonymous structure containing the following members:</p> <pre>unsigned short semval        /* semaphore value */ pid_t           sempid       /* process ID of last operation */ unsigned short semncnt       /* number of processes waiting for semval                               /* to become greater than current value */ unsigned short semzcnt       /* number of processes waiting for semval to become 0 */</pre> <p>The <code>sembuf</code> structure contains the following members:</p> <pre>unsigned short sem_num       /* semaphore number */ short           sem_op       /* semaphore operation */ short           sem_flg       /* operation flags */</pre> <p>All of the symbols from <code>&lt;sys/ipc.h&gt;</code> are defined when this header is included. See <code>ipc.h(3HEAD)</code>.</p>

sem.h(3HEAD)

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

<b>SEE ALSO</b>	shmctl(2), shmget(2), shmop(2), <a href="#">ipc.h(3HEAD)</a> , <a href="#">types.h(3HEAD)</a> , <a href="#">attributes(5)</a> , <a href="#">standards(5)</a>				

<b>NAME</b>	siginfo.h, siginfo – signal generation information												
<b>SYNOPSIS</b>	<pre>#include &lt;siginfo.h&gt;</pre>												
<b>DESCRIPTION</b>	<p>If a process is catching a signal, it might request information that tells why the system generated that signal. See <code>sigaction(2)</code>. If a process is monitoring its children, it might receive information that tells why a child changed state. See <code>waitid(2)</code>. In either case, the system returns the information in a structure of type <code>siginfo_t</code>, which includes the following information:</p> <pre>int          si_signo      /* signal number */ int          si_errno      /* error number */ int          si_code       /* signal code */ union sigval si_value     /* signal value */</pre> <p><code>si_signo</code> contains the system-generated signal number. For the <code>waitid(2)</code> function, <code>si_signo</code> is always <code>SIGCHLD</code>.</p> <p>If <code>si_errno</code> is non-zero, it contains an error number associated with this signal, as defined in <code>&lt;errno.h&gt;</code>.</p> <p><code>si_code</code> contains a code identifying the cause of the signal.</p> <p>If the value of the <code>si_code</code> member is <code>SI_NOINFO</code>, only the <code>si_signo</code> member of <code>siginfo_t</code> is meaningful, and the value of all other members is unspecified.</p>												
<b>User Signals</b>	<p>If the value of <code>si_code</code> is less than or equal to 0, then the signal was generated by a user process (see <code>kill(2)</code>, <code>_lwp_kill(2)</code>, <code>sigqueue(3RT)</code>, <code>sigsend(2)</code>, <code>abort(3C)</code>, and <code>raise(3C)</code>) and the <code>siginfo</code> structure contains the following additional information:</p> <pre>pid_t      si_pid      /* sending process ID */ uid_t      si_uid      /* sending user ID */ ctid_t     si_ctid     /* sending contract ID */ zoneid_t   si_zoneid   /* sending zone ID */S</pre> <p>If the signal was generated by a user process, the following values are defined for <code>si_code</code>:</p> <table border="0"> <tr> <td style="padding-right: 20px;"><code>SI_USER</code></td> <td>The implementation sets <code>si_code</code> to <code>SI_USER</code> if the signal was sent by <code>kill(2)</code>, <code>sigsend(2)</code>, <code>raise(3C)</code> or <code>abort(3C)</code>.</td> </tr> <tr> <td><code>SI_LWP</code></td> <td>The signal was sent by <code>_lwp_kill(2)</code>.</td> </tr> <tr> <td><code>SI_QUEUE</code></td> <td>The signal was sent by <code>sigqueue(3RT)</code>.</td> </tr> <tr> <td><code>SI_TIMER</code></td> <td>The signal was generated by the expiration of a timer created by <code>timer_settime(3RT)</code>.</td> </tr> <tr> <td><code>SI_ASYNCIO</code></td> <td>The signal was generated by the completion of an asynchronous I/O request.</td> </tr> <tr> <td><code>SI_MSGQ</code></td> <td>The signal was generated by the arrival of a message on an empty message queue. See <code>mq_notify(3RT)</code>.</td> </tr> </table>	<code>SI_USER</code>	The implementation sets <code>si_code</code> to <code>SI_USER</code> if the signal was sent by <code>kill(2)</code> , <code>sigsend(2)</code> , <code>raise(3C)</code> or <code>abort(3C)</code> .	<code>SI_LWP</code>	The signal was sent by <code>_lwp_kill(2)</code> .	<code>SI_QUEUE</code>	The signal was sent by <code>sigqueue(3RT)</code> .	<code>SI_TIMER</code>	The signal was generated by the expiration of a timer created by <code>timer_settime(3RT)</code> .	<code>SI_ASYNCIO</code>	The signal was generated by the completion of an asynchronous I/O request.	<code>SI_MSGQ</code>	The signal was generated by the arrival of a message on an empty message queue. See <code>mq_notify(3RT)</code> .
<code>SI_USER</code>	The implementation sets <code>si_code</code> to <code>SI_USER</code> if the signal was sent by <code>kill(2)</code> , <code>sigsend(2)</code> , <code>raise(3C)</code> or <code>abort(3C)</code> .												
<code>SI_LWP</code>	The signal was sent by <code>_lwp_kill(2)</code> .												
<code>SI_QUEUE</code>	The signal was sent by <code>sigqueue(3RT)</code> .												
<code>SI_TIMER</code>	The signal was generated by the expiration of a timer created by <code>timer_settime(3RT)</code> .												
<code>SI_ASYNCIO</code>	The signal was generated by the completion of an asynchronous I/O request.												
<code>SI_MSGQ</code>	The signal was generated by the arrival of a message on an empty message queue. See <code>mq_notify(3RT)</code> .												

siginfo.h(3HEAD)

`si_value` contains the application specified value, which is passed to the application's signal-catching function at the time of the signal delivery if `si_code` is any of `SI_QUEUE`, `SI_TIMER`, `SI_ASYNCIO`, or `SI_MESGQ`.

### System Signals

Non-user generated signals can arise for a number of reasons. For all of these cases, `si_code` contains a positive value reflecting the reason why the system generated the signal:

Signal	Code	Reason
SIGILL	ILL_ILLOPC	illegal opcode
	ILL_ILLOPN	illegal operand
	ILL_ILLADR	illegal addressing mode
	ILL_ILTRP	illegal trap
	ILL_PRVOPC	privileged opcode
	ILL_PRVREG	privileged register
	ILL_COPROC	co-processor error
	ILL_BADSTK	internal stack error
SIGFPE	FPE_INTDIV	integer divide by zero
	FPE_INTOVF	integer overflow
	FPE_FLTDIV	floating point divide by zero
	FPE_FLTOVF	floating point overflow
	FPE_FLTUND	floating point underflow
	FPE_FLTRES	floating point inexact result
	FPE_FLTINV	invalid floating point operation
	FPE_FLTSUB	subscript out of range
SIGSEGV	SEGV_MAPERR	address not mapped to object
	SEGV_ACCERR	invalid permissions for mapped object
SIGBUS	BUS_ADRALN	invalid address alignment
	BUS_ADRERR	non-existent physical address
	BUS_OBJERR	object specific hardware error
SIGTRAP	TRAP_BRKPT	process breakpoint
	TRAP_TRACE	process trace trap
SIGCHLD	CLD_EXITED	child has exited

	CLD_KILLED	child was killed
	CLD_DUMPED	child terminated abnormally
	CLD_TRAPPED	traced child has trapped
	CLD_STOPPED	child has stopped
	CLD_CONTINUED	stopped child had continued
SIGPOLL	POLL_IN	data input available
	POLL_OUT	output buffers available
	POLL_MSG	input message available
	POLL_ERR	I/O error
	POLL_PRI	high priority input available
	POLL_HUP	device disconnected

Signals can also be generated from the resource control subsystem. Where these signals do not already possess kernel-level `siginfo` codes, the `siginfo` `si_code` will be filled with `SI_RCTL` to indicate a kernel-generated signal from an established resource control value.

Signal	Code	Reason
SIGXRES	SI_RCTL	resource-control generated signal
SIGHUP		
SIGTERM		

The uncatchable signals `SIGSTOP` and `SIGKILL` have undefined `siginfo` codes.

Signals sent with a `siginfo` code of `SI_RCTL` contain code-dependent information for kernel-generated signals:

Code	Field	Value
SI_RCTL	hr_time si_entity	process-model entity of control

In addition, the following signal-dependent information is available for kernel-generated signals:

Signal	Field	Value
--------	-------	-------

siginfo.h(3HEAD)

SIGILL	caddr_t si_addr	address of faulting instruction
SIGFPE		
SIGSEGV	caddr_t si_addr	address of faulting memory reference
SIGBUS		
SIGCHLD	pid_t si_pid	child process ID
	int si_status	exit value or signal
SIGPOLL	long si_band	band event for POLL_IN, POLL_OUT, or POLL_MSG

**SEE ALSO** [\\_lwp\\_kill\(2\)](#), [kill\(2\)](#), [setrctl\(2\)](#), [sigaction\(2\)](#), [sigsend\(2\)](#), [waitid\(2\)](#), [abort\(3C\)](#), [aio\\_read\(3RT\)](#), [mq\\_notify\(3RT\)](#), [raise\(3C\)](#), [signal.h\(3HEAD\)](#), [sigqueue\(3RT\)](#), [timer\\_create\(3RT\)](#), [timer\\_settime\(3RT\)](#)

**NOTES** For SIGCHLD signals, if `si_code` is equal to `CLD_EXITED`, then `si_status` is equal to the exit value of the process; otherwise, it is equal to the signal that caused the process to change state. For some implementations, the exact value of `si_addr` might not be available; in that case, `si_addr` is guaranteed to be on the same page as the faulting instruction or memory reference.

<b>NAME</b>	signal.h, signal – base signals
<b>SYNOPSIS</b>	<code>#include &lt;signal.h&gt;</code>
<b>DESCRIPTION</b>	<p>A signal is an asynchronous notification of an event. A signal is said to be generated for (or sent to) a process when the event associated with that signal first occurs. Examples of such events include hardware faults, timer expiration and terminal activity, as well as the invocation of the <code>kill(2)</code> or <code>sigsend(2)</code> functions. In some circumstances, the same event generates signals for multiple processes. A process may request a detailed notification of the source of the signal and the reason why it was generated. See <a href="#">siginfo.h(3HEAD)</a>.</p> <p>Signals can be generated synchronously or asynchronously. Events directly caused by the execution of code by a thread, such as a reference to an unmapped, protected, or bad memory can generate <code>SIGSEGV</code> or <code>SIGBUS</code>; a floating point exception can generate <code>SIGFPE</code>; and the execution of an illegal instruction can generate <code>SIGILL</code>. Such events are referred to as traps; signals generated by traps are said to be synchronously generated. Synchronously generated signals are initiated by a specific thread and are delivered to and handled by that thread.</p> <p>Signals may also be generated by calling <code>kill()</code>, <code>sigqueue()</code>, or <code>sigsend()</code>. Events such as keyboard interrupts generate signals, such as <code>SIGINT</code>, which are sent to the target process. Such events are referred to as interrupts; signals generated by interrupts are said to be asynchronously generated. Asynchronously generated signals are not directed to a particular thread but are handled by an arbitrary thread that meets either of the following conditions:</p> <ul style="list-style-type: none"> <li>■ The thread is blocked in a call to <code>sigwait(2)</code> whose argument includes the type of signal generated.</li> <li>■ The thread has a signal mask that does not include the type of signal generated. See <code>thr_create(3C)</code>. Each process can specify a system action to be taken in response to each signal sent to it, called the signal's disposition. All threads in the process share the disposition. The set of system signal actions for a process is initialized from that of its parent. Once an action is installed for a specific signal, it usually remains installed until another disposition is explicitly requested by a call to either <code>sigaction()</code>, <code>signal()</code> or <code>sigset()</code>, or until the process <code>execs()</code>. See <code>sigaction(2)</code> and <code>signal(3C)</code>. When a process <code>execs</code>, all signals whose disposition has been set to catch the signal will be set to <code>SIG_DFL</code>. Alternatively, a process may request that the system automatically reset the disposition of a signal to <code>SIG_DFL</code> after it has been caught. See <code>sigaction(2)</code> and <code>signal(3C)</code>.</li> </ul> <p><b>SIGNAL DELIVERY</b> A signal is said to be delivered to a process when a thread within the process takes the appropriate action for the disposition of the signal. Delivery of a signal can be blocked. There are two methods for handling delivery of a signal in a multithreaded application. The first method specifies a signal handler function to execute when the signal is received by the process. See <code>sigaction(2)</code>. The second method uses <code>sigwait(2)</code> to create a thread to handle the receipt of the signal. The <code>sigaction()</code></p>

signal.h(3HEAD)

function can be used for both synchronously and asynchronously generated signals. The `sigwait()` function will work only for asynchronously generated signals, as synchronously generated signals are sent to the thread that caused the event. The `sigwait()` function is the recommended for use with a multithreaded application.

## SIGNAL MASK

Each thread has a signal mask that defines the set of signals currently blocked from delivery to it. The signal mask of the main thread is inherited from the signal mask of the thread that created it in the parent process. The selection of the thread within the process that is to take the appropriate action for the signal is based on the method of signal generation and the signal masks of the threads in the receiving process. Signals that are generated by action of a particular thread such as hardware faults are delivered to the thread that caused the signal. See `thr_sigsetmask(3C)` or `sigprocmask(2)`. See `alarm(2)` for current semantics of delivery of `SIGALRM`. Signals that are directed to a particular thread are delivered to the targeted thread. See `thr_kill(3C)`. If the selected thread has blocked the signal, it remains pending on the thread until it is unblocked. For all other types of signal generation (for example, `kill(2)`, `sigsend(2)`, terminal activity, and other external events not ascribable to a particular thread) one of the threads that does not have the signal blocked is selected to process the signal. If all the threads within the process block the signal, it remains pending on the process until a thread in the process unblocks it. If the action associated with a signal is set to ignore the signal then both currently pending and subsequently generated signals of this type are discarded immediately for this process.

The determination of which action is taken in response to a signal is made at the time the signal is delivered to a thread within the process, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated.

The signals currently defined by `<signal.h>` are as follows:

Name	Value	Default	Event
SIGHUP	1	Exit	Hangup (see <code>termio(7I)</code> )
SIGINT	2	Exit	Interrupt (see <code>termio(7I)</code> )
SIGQUIT	3	Core	Quit (see <code>termio(7I)</code> )
SIGILL	4	Core	Illegal Instruction
SIGTRAP	5	Core	Trace or Breakpoint Trap
SIGABRT	6	Core	Abort
SIGEMT	7	Core	Emulation Trap
SIGFPE	8	Core	Arithmetic Exception
SIGKILL	9	Exit	Killed
SIGBUS	10	Core	Bus Error

Name	Value	Default	Event
SIGSEGV	11	Core	Segmentation Fault
SIGSYS	12	Core	Bad System Call
SIGPIPE	13	Exit	Broken Pipe
SIGALRM	14	Exit	Alarm Clock
SIGTERM	15	Exit	Terminated
SIGUSR1	16	Exit	User Signal 1
SIGUSR2	17	Exit	User Signal 2
SIGCHLD	18	Ignore	Child Status Changed
SIGPWR	19	Ignore	Power Fail or Restart
SIGWINCH	20	Ignore	Window Size Change
SIGURG	21	Ignore	Urgent Socket Condition
SIGPOLL	22	Exit	Pollable Event (see <code>streamio(7I)</code> )
SIGSTOP	23	Stop	Stopped (signal)
SIGTSTP	24	Stop	Stopped (user) (see <code>termio(7I)</code> )
SIGCONT	25	Ignore	Continued
SIGTTIN	26	Stop	Stopped (tty input) (see <code>termio(7I)</code> )
SIGTTOU	27	Stop	Stopped (tty output) (see <code>termio(7I)</code> )
SIGVTALRM	28	Exit	Virtual Timer Expired
SIGPROF	29	Exit	Profiling Timer Expired
SIGXCPU	30	Core	CPU time limit exceeded (see <code>getrlimit(2)</code> )
SIGXFSZ	31	Core	File size limit exceeded (see <code>getrlimit(2)</code> )
SIGWAITING	32	Ignore	Reserved for threading support
SIGLWP	33	Ignore	Reserved for threading support
SIGFREEZE	34	Ignore	Check point Freeze
SIGTHAW	35	Ignore	Check point Thaw
SIGCANCEL	36	Ignore	Reserved for threading support
SIGLOST	37	Exit	Resource lost (for example, record-lock lost)
SIGXRES	38	Ignore	Resource control exceeded (see <code>setrctl(2)</code> )
SIGJVM1	39	Ignore	Reserved for Java Virtual Machine 1

signal.h(3HEAD)

Name	Value	Default	Event
SIGJVM2	40	Ignore	Reserved for Java Virtual Machine 2
SIGRTMIN	*	Exit	First real time signal
(SIGRTMIN+1)	*	Exit	Second real time signal
. . .			
(SIGRTMAX-1)	*	Exit	Second-to-last real time signal
SIGRTMAX	*	Exit	Last real time signal

The symbols SIGRTMIN through SIGRTMAX are evaluated dynamically in order to permit future configurability.

**SIGNAL DISPOSITION**

A process using a `signal(3C)`, `sigset(3C)` or `sigaction(2)` system call can specify one of three dispositions for a signal: take the default action for the signal, ignore the signal, or catch the signal.

**Default Action: SIG\_DFL**

A disposition of SIG\_DFL specifies the default action. The default action for each signal is listed in the table above and is selected from the following:

- Exit      When it gets the signal, the receiving process is to be terminated with all the consequences outlined in `exit(2)`.
- Core      When it gets the signal, the receiving process is to be terminated with all the consequences outlined in `exit(2)`. In addition, a “core image” of the process is constructed in the current working directory.
- Stop      When it gets the signal, the receiving process is to stop. When a process is stopped, all the threads within the process also stop executing.
- Ignore    When it gets the signal, the receiving process is to ignore it. This is identical to setting the disposition to SIG\_IGN.

**Ignore Signal: SIG\_IGN**

A disposition of SIG\_IGN specifies that the signal is to be ignored. Setting a signal action to SIG\_IGN for a signal that is pending causes the pending signal to be discarded, whether or not it is blocked. Any queued values pending are also discarded, and the resources used to queue them are released and made available to queue other signals.

**Catch Signal: function address**

A disposition that is a function address specifies that, when it gets the signal, the thread within the process that is selected to process the signal will execute the signal handler at the specified address. Normally, the signal handler is passed the signal number as its only argument. If the disposition was set with the `sigaction(2)` function, however, additional arguments can be requested. When the signal handler returns, the receiving process resumes execution at the point it was interrupted, unless the signal handler makes other arrangements. If an invalid function address is specified, results are undefined.

If the disposition has been set with the `sigset()` or `sigaction()`, the signal is automatically blocked in the thread while it is executing the signal catcher. If a `longjmp()` is used to leave the signal catcher, then the signal must be explicitly unblocked by the user. See `setjmp(3C)`, `signal(3C)` and `sigprocmask(2)`.

If execution of the signal handler interrupts a blocked function call, the handler is executed and the interrupted function call returns `-1` to the calling process with `errno` set to `EINTR`. If the `SA_RESTART` flag is set, however, certain function calls will be transparently restarted.

Some signal-generating functions, such as high resolution timer expiration, asynchronous I/O completion, inter-process message arrival, and the `sigqueue(3RT)` function, support the specification of an application defined value, either explicitly as a parameter to the function, or in a `sigevent` structure parameter. The `sigevent` structure is defined by `<signal.h>` and contains at least the following members:

Member	Member	
Type	Name	Description
int	<code>sigev_notify</code>	Notification type
int	<code>sigev_signo</code>	Signal number
union <code>sigval</code>	<code>sigev_value</code>	Signal value

The `sigval` union is defined by `<signal.h>` and contains at least the following members:

Member	Member	
Type	Name	Description
int	<code>sival_int</code>	Integer signal value
void *	<code>sival_ptr</code>	Pointer signal value

The `sigev_notify` member specifies the notification mechanism to use when an asynchronous event occurs. The `sigev_notify` member may be defined with the following values:

<code>SIGEV_NONE</code>	No asynchronous notification is delivered when the event of interest occurs.
<code>SIGEV_SIGNAL</code>	A queued signal, with its value application-defined, is generated when the event of interest occurs.

## signal.h(3HEAD)

**SIGEV\_PORT** An asynchronous notification is delivered to an event port when the event of interest occurs. The `sival_ptr` member points to a `port_notify_t` structure (see `port_associate(3C)`). The event port identifier as well as an application-defined cookie are part of the `port_notify_t` structure.

Your implementation may define additional notification mechanisms.

The `sigev_signo` member specifies the signal to be generated.

The `sigev_value` member references the application defined value to be passed to the signal-catching function at the time of the signal delivery as the `si_value` member of the `siginfo_t` structure.

The `sival_int` member is used when the application defined value is of type `int`, and the `sival_ptr` member is used when the application defined value is a pointer.

When a signal is generated by `sigqueue(3RT)` or any signal-generating function which supports the specification of an application defined value, the signal is marked pending and, if the `SA_SIGINFO` flag is set for that signal, the signal is queued to the process along with the application specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. If the `SA_SIGINFO` flag is not set for that signal, later occurrences of that signal's generation, when a signal is already queued, are silently discarded.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

ATTRIBUTE TYPE	ATTRIBUTE VALUE
Interface Stability	Standard

**SEE ALSO** `lockd(1M)`, `intro(2)`, `alarm(2)`, `exit(2)`, `fcntl(2)`, `getrlimit(2)`, `ioctl(2)`, `kill(2)`, `pause(2)`, `setrctl(2)`, `sigaction(2)`, `sigaltstack(2)`, `sigprocmask(2)`, `sigsend(2)`, `sigsuspend(2)`, `sigwait(2)`, `port_associate(3C)`, `setjmp(3C)`, [siginfo.h\(3HEAD\)](#), `signal(3C)`, `sigqueue(3RT)`, `sigsetops(3C)`, `thr_create(3C)`, `thr_kill(3C)`, `thr_sigsetmask(3C)`, [ucontext.h\(3HEAD\)](#), `wait(3C)`, `attributes(5)`, `standards(5)`

**NOTES** The dispositions of the `SIGKILL` and `SIGSTOP` signals cannot be altered from their default values. The system generates an error if this is attempted.

The `SIGKILL` and `SIGSTOP` signals cannot be blocked. The system silently enforces this restriction.

Whenever a process receives a `SIGSTOP`, `SIGTSTP`, `SIGTTIN`, or `SIGTTOU` signal, regardless of its disposition, any pending `SIGCONT` signal are discarded.

Whenever a process receives a `SIGCONT` signal, regardless of its disposition, any pending `SIGSTOP`, `SIGTSTP`, `SIGTTIN`, and `SIGTTOU` signals is discarded. In addition, if the process was stopped, it is continued.

SIGPOLL is issued when a file descriptor corresponding to a STREAMS file has a “selectable” event pending. See `intro(2)`. A process must specifically request that this signal be sent using the `I_SETSIG` `ioctl` call. Otherwise, the process will never receive SIGPOLL.

If the disposition of the SIGCHLD signal has been set with `signal` or `sigset`, or with `sigaction` and the `SA_NOCLDSTOP` flag has been specified, it will only be sent to the calling process when its children exit; otherwise, it will also be sent when the calling process’s children are stopped or continued due to job control.

The name SIGCLD is also defined in this header and identifies the same signal as SIGCHLD. SIGCLD is provided for backward compatibility, new applications should use SIGCHLD.

The disposition of signals that are inherited as `SIG_IGN` should not be changed.

Signals which are generated synchronously should not be masked. If such a signal is blocked and delivered, the receiving process is killed.

## socket.h(3HEAD)

**NAME** socket.h, socket – Internet Protocol family

**SYNOPSIS** #include <sys/socket.h>

**DESCRIPTION** The <sys/socket.h> header defines the unsigned integral type `sa_family_t` through typedef.

The <sys/socket.h> header defines the `sockaddr` structure that includes the following members:

---

<code>sa_family_t</code>	<code>sa_family</code>	<code>/* address family */</code>
<code>char</code>	<code>sa_data[ ]</code>	<code>/* socket address (variable-length data) */</code>

---

The <sys/socket.h> header defines the `msghdr` structure that includes the following members:

---

<code>void</code>	<code>*msg_name</code>	<code>/* optional address */</code>
<code>size_t</code>	<code>msg_namelen</code>	<code>/* size of address */</code>
<code>struct iovec</code>	<code>*msg_iov</code>	<code>/* scatter/gather array */</code>
<code>int</code>	<code>msg_iovlen</code>	<code>/* members in msg_iov */</code>
<code>void</code>	<code>*msg_control</code>	<code>/* ancillary data, see below */</code>
<code>size_t</code>	<code>msg_controllen</code>	<code>/* ancillary data buffer len */</code>
<code>int</code>	<code>msg_flags</code>	<code>/* flags on received message */</code>

---

The <sys/socket.h> header defines the `cmsghdr` structure that includes the following members:

---

<code>size_t</code>	<code>cmsg_len</code>	<code>/* data byte count, including hdr */</code>
<code>int</code>	<code>cmsg_level</code>	<code>/* originating protocol */</code>

---

---

```
int                cmsg_type                /* protocol-specific
                                                    type */
```

---

Ancillary data consists of a sequence of pairs, each consisting of a `cmsghdr` structure followed by a data array. The data array contains the ancillary data message, and the `cmsghdr` structure contains descriptive information that allows an application to correctly parse the data.

The values for `msg_level` will be legal values for the level argument to the `getsockopt()` and `setsockopt()` functions. The `SCM_RIGHTS` type is supported for level `SOL_SOCKET`.

Ancillary data is also possible at the socket level. The `<sys/socket.h>` header defines the following macro for use as the `msg_type` value when `msg_level` is `SOL_SOCKET`:

`SCM_RIGHTS`      Indicates that the data array contains the access rights to be sent or received.

`SCM_UCRED`      Indicates that the data array contains a `ucred_t` to be received. The `ucred_t` is the credential of the sending process at the time the message was sent. This is a Sun-specific, Evolving interface. See `ucred_get(3C)`.

The `<sys/socket.h>` header defines the following macros to gain access to the data arrays in the ancillary data associated with a message header:

`MSG_DATA(msg)`

If the argument is a pointer to a `cmsghdr` structure, this macro returns an unsigned character pointer to the data array associated with the `cmsghdr` structure.

`MSG_NXTHDR(mhdr, msg)`

If the first argument is a pointer to a `msghdr` structure and the second argument is a pointer to a `cmsghdr` structure in the ancillary data, pointed to by the `msg_control` field of that `msghdr` structure, this macro returns a pointer to the next `cmsghdr` structure, or a null pointer if this structure is the last `cmsghdr` in the ancillary data.

`MSG_FIRSTHDR(mhdr)`

If the argument is a pointer to a `msghdr` structure, this macro returns a pointer to the first `cmsghdr` structure in the ancillary data associated with this `msghdr` structure, or a null pointer if there is no ancillary data associated with the `msghdr` structure.

`MSG_SPACE(len)`

Given the length of an ancillary data object, `MSG_SPACE()` returns the space required by the object and its `cmsghdr` structure, including any padding needed to satisfy alignment requirements. This macro can be used, for example, to allocate space dynamically for the ancillary data. This macro should not be used to initialize the `msg_len` member of a `cmsghdr` structure. Use the `MSG_LEN()` macro instead.

## socket.h(3HEAD)

### MSG\_LEN(*len*)

Given the length of an ancillary data object, `MSG_LEN()` returns the value to store in the `msg_len` member of the `cmsghdr` structure, taking into account any padding needed to satisfy alignment requirements.

The `<sys/socket.h>` header defines the `linger` structure that includes the following members:

<code>int</code>	<code>l_onoff</code>	<code>/* indicates whether linger option is enabled */</code>
<code>int</code>	<code>l_linger</code>	<code>/* linger time, in seconds */</code>

The `<sys/socket.h>` header defines the following macros:

<code>SOCK_DGRAM</code>	Datagram socket
<code>SOCK_STREAM</code>	Byte-stream socket
<code>SOCK_SEQPACKET</code>	Sequenced-packet socket

The `<sys/socket.h>` header defines the following macro for use as the *level* argument of `setsockopt()` and `getsockopt()`.

`SOL_SOCKET` Options to be accessed at socket level, not protocol level.

The `<sys/socket.h>` header defines the following macros: for use as the *option\_name* argument in `getsockopt()` or `setsockopt()` calls:

<code>SO_DEBUG</code>	Debugging information is being recorded.
<code>SO_ACCEPTCONN</code>	Socket is accepting connections.
<code>SO_BROADCAST</code>	Transmission of broadcast messages is supported.
<code>SO_REUSEADDR</code>	Reuse of local addresses is supported.
<code>SO_KEEPAIVE</code>	Connections are kept alive with periodic messages.
<code>SO_LINGER</code>	Socket lingers on close.
<code>SO_OOBINLINE</code>	Out-of-band data is transmitted in line.
<code>SO_SNDBUF</code>	Send buffer size.
<code>SO_RCVBUF</code>	Receive buffer size.
<code>SO_ERROR</code>	Socket error status.
<code>SO_TYPE</code>	Socket type.
<code>SO_RECVUCRED</code>	Request the reception of user credential ancillary data. This is a Sun-specific, Evolving interface. See <code>ucred_get(3C)</code> .

The `<sys/socket.h>` header defines the following macros for use as the valid values for the `msg_flags` field in the `msghdr` structure, or the `flags` parameter in `recvfrom()`, `recvmsg()`, `sendto()`, or `sendmsg()` calls:

`MSG_CTRUNC`      Control data truncated.  
`MSG_EOR`          Terminates a record (if supported by the protocol).  
`MSG_OOB`          Out-of-band data.  
`MSG_PEEK`        Leave received data in queue.  
`MSG_TRUNC`       Normal data truncated.  
`MSG_WAITALL`    Wait for complete message.

The `<sys/socket.h>` header defines the following macros:

`AF_UNIX`          UNIX domain sockets  
`AF_INET`          Internet domain sockets

The `<sys/socket.h>` header defines the following macros:

`SHUT_RD`          Disables further receive operations.  
`SHUT_WR`          Disables further send operations.  
`SHUT_RDWR`      Disables further send and receive operations.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

## spawn.h(3HEAD)

- NAME** spawn.h, spawn – spawn
- SYNOPSIS** #include <spawn.h>
- DESCRIPTION** The <spawn.h> header defines the `posix_spawnattr_t` and `posix_spawn_file_actions_t` types used in performing spawn operations.
- The <spawn.h> header defines the flags that can be set in a `posix_spawnattr_t` object using the `posix_spawnattr_setflags()` function:
- ```
POSIX_SPAWN_RESETEIDS
POSIX_SPAWN_SETPGROUP
POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK
```
- Inclusion of the <spawn.h> header can make visible symbols defined in the <sched.h>, <signal.h>, and <sys/types.h> headers.
- ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|

| <b>NAME</b>        | stat.h, stat – data returned by stat system call                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>SYNOPSIS</b>    | <pre>#include &lt;sys/types.h&gt; #include &lt;sys/stat.h&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DESCRIPTION</b> | <p>The system calls <code>stat</code>, <code>lstat</code> and <code>fstat</code> return data in a <code>stat</code> structure, which is defined in <code>&lt;stat.h&gt;</code>.</p> <p>The constants used in the <code>st_mode</code> field are also defined in this file:</p> <pre>#define      S_IFMT                /* type of file */ #define      S_IAMB                /* access mode bits */ #define      S_IFIFO                /* fifo */ #define      S_IFCHR                /* character special */ #define      S_IFDIR                /* directory */ #define      S_IFNAM                /* XENIX special named file */ #define      S_INSEM                /* XENIX semaphore subtype of IFNAM */ #define      S_INSHD                /* XENIX shared data subtype of IFNAM */ #define      S_IFBLK                /* block special */ #define      S_IFREG                /* regular */ #define      S_IFLNK                /* symbolic link */ #define      S_IFSOCK                /* socket */ #define      S_IFDOOR                /* door */ #define      S_ISUID                /* set user id on execution */ #define      S_ISGID                /* set group id on execution */ #define      S_ISVTX                /* save swapped text even after use */ #define      S_IREAD                /* read permission, owner */ #define      S_IWRITE                /* write permission, owner */ #define      S_IEXEC                /* execute/search permission, owner */ #define      S_ENFMT                /* record locking enforcement flag */ #define      S_IRWXU                /* read, write, execute: owner */ #define      S_IRUSR                /* read permission: owner */ #define      S_IWUSR                /* write permission: owner */ #define      S_IXUSR                /* execute permission: owner */</pre> |

## stat.h(3HEAD)

```
#define S_IRWXG /* read, write, execute: group */
#define S_IRGRP /* read permission: group */
#define S_IWGRP /* write permission: group */
#define S_IXGRP /* execute permission: group */
#define S_IRWXO /* read, write, execute: other */
#define S_IROTH /* read permission: other */
#define S_IWOTH /* write permission: other */
#define S_IXOTH /* execute permission: other */
```

The following macros are for POSIX conformance (see [standards\(5\)](#)):

```
#define S_ISBLK(mode) block special file
#define S_ISCHR(mode) character special file
#define S_ISDIR(mode) directory file
#define S_ISFIFO(mode) pipe or fifo file
#define S_ISREG(mode) regular file
#define S_ISSOCK(mode) socket file
```

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** [stat\(2\)](#), [types.h\(3HEAD\)](#), [attributes\(5\)](#), [standards\(5\)](#)

**NAME** statvfs.h, statvfs – VFS File System information structure

**SYNOPSIS** #include <sys/statvfs.h>

**DESCRIPTION** The <sys/statvfs.h> header defines the statvfs structure, which includes the following members:

```

unsigned long f_bsize      /* file system block size */
unsigned long f_frsize    /* fundamental file system block size */
fsblkcnt_t   f_blocks     /* total number of blocks on file system */
                /* in units of f_frsize */
fsblkcnt_t   f_bfree      /* total number of free blocks */
fsblkcnt_t   f_bavail     /* number of free blocks available to */
                /* non-privileged process */
fsfilcnt_t   f_files      /* total number of file serial numbers */
fsfilcnt_t   f_ffree      /* total number of free file serial numbers */
fsfilcnt_t   f_favail     /* number of file serial numbers available */
                /* to non-privileged process */
unsigned long f_fsid      /* file system ID */
unsigned long f_flag      /* bit mask of f_flag values */
unsigned long f_namemax   /* maximum filename length */

```

The fsblkcnt\_t and fsfilcnt\_t types are defined as described in <sys/types.h>. See [types.h\(3HEAD\)](#).

The following flags for the f\_flag member are defined:

```

ST_RDONLY      read-only file system
ST_NOSUID      does not support setuid()/setgid() semantics

```

**ATTRIBUTES** See [attributes\(5\)](#) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

stdbool.h(3HEAD)

**NAME** | stdbool.h, stdbool – boolean type and values

**SYNOPSIS** | #include <stdbool.h>

**DESCRIPTION** | The <stdbool.h> header defines the following macros:

bool | expands to \_Bool

true | expands to the integer constant 1

false | expands to the integer constant 0

\_\_bool\_true\_false\_are\_defined | expands to the integer constant 1

An application can undefine and then possibly redefine the macros bool, true, and false.

**ATTRIBUTES** | See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** | attributes(5), standards(5)

**NAME** | `stddef.h`, `stddef` – standard type definitions

**SYNOPSIS** | `#include <stddef.h>`

**DESCRIPTION** | The `<stddef.h>` header defines the following macros:

`NULL`  
Null pointer constant.

`offsetof(type, member-designator)`  
Integer constant expression of type `size_t`, the value of which is the offset in bytes to the structure member (`member-designator`), from the beginning of its structure (`type`).

The `<stddef.h>` header defines the following types:

`ptrdiff_t` | Signed integer type of the result of subtracting two pointers.

`wchar_t` | Integer type whose range of values can represent distinct wide-character codes for all members of the largest character set specified among the locales supported by the compilation environment: the null character has the code value 0 and each member of the portable character set has a code value equal to its value when used as the lone character in an integer character constant.

`size_t` | Unsigned integer type of the result of the `sizeof` operator.

The implementation supports one or more programming environments in which the widths of `ptrdiff_t`, `size_t`, and `wchar_t` are no greater than the width of type `long`. The names of these programming environments can be obtained using the `confstr(3C)` function or the `getconf(1)` utility.

**ATTRIBUTES** | See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

| <b>NAME</b>        | stdint.h,stdint – integer types                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SYNOPSIS</b>    | #include <stdint.h>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>DESCRIPTION</b> | <p>The &lt;stdint.h&gt; header declares sets of integer types having specified widths, and defines corresponding sets of macros. It also defines macros that specify limits of integer types corresponding to types defined in other standard headers.</p> <p>The “width” of an integer type is the number of bits used to store its value in a pure binary system; the actual type can use more bits than that (for example, a 28-bit type could be stored in 32 bits of actual storage). An N-bit signed type has values in the range <math>-2^{N-1}</math> or <math>1-2^{N-1}</math> to <math>2^{N-1}-1</math>, while an N-bit unsigned type has values in the range 0 to <math>2^N-1</math>.</p> <p>Types are defined in the following categories:</p> <ul style="list-style-type: none"><li>■ integer types having certain exact widths</li><li>■ integer types having at least certain specified widths</li><li>■ fastest integer types having at least certain specified widths</li><li>■ integer types wide enough to hold pointers to objects</li><li>■ integer types having greatest width</li></ul> <p>Some of these types may denote the same type.</p> <p>Corresponding macros specify limits of the declared types and construct suitable constants.</p> <p>For each type described herein that the implementation provides, the &lt;stdint.h&gt; header declares that typedef name and defines the associated macros. Conversely, for each type described herein that the implementation does not provide, the &lt;stdint.h&gt; header does not declare that typedef name, nor does it define the associated macros. An implementation provides those types described as required, but need not provide any of the others (described as optional).</p> <p><b>Integer Types</b></p> <p>When typedef names differing only in the absence or presence of the initial u are defined, they denote corresponding signed and unsigned types as described in the ISO/IEC 9899: 1999 standard, Section 6.2.5; an implementation providing one of these corresponding types must also provide the other.</p> <p>In the following descriptions, the symbol <i>N</i> represents an unsigned decimal integer with no leading zeros (for example, 8 or 24, but not 04 or 048).</p> <p>Exact-width integer types</p> <p>The typedef name <code>intN_t</code> designates a signed integer type with width <i>N</i>, no padding bits, and a two’s-complement representation. Thus, <code>int8_t</code> denotes a signed integer type with a width of exactly 8 bits.</p> <p>The typedef name <code>uintN_t</code> designates an unsigned integer type with width <i>N</i>. Thus, <code>uint24_t</code> denotes an unsigned integer type with a width of exactly 24 bits.</p> <p>The following types are required:</p> |

```
int8_t
int16_t
int32_t
uint8_t
uint16_t
uint32_t
```

If an implementation provides integer types with width 64 that meet these requirements, then the following types are required:

```
int64_t
uint64_t
```

In particular, this is the case if any of the following are true:

- The implementation supports the `_POSIX_V6_ILP32_OFFBIG` programming environment and the application is being built in the `_POSIX_V6_ILP32_OFFBIG` programming environment (see the Shell and Utilities volume of IEEE Std 1003.1-200x, c99, Programming Environments).
- The implementation supports the `_POSIX_V6_LP64_OFF64` programming environment and the application is being built in the `_POSIX_V6_LP64_OFF64` programming environment.
- The implementation supports the `_POSIX_V6_LPBIG_OFFBIG` programming environment and the application is being built in the `_POSIX_V6_LPBIG_OFFBIG` programming environment.

All other types of this form are optional.

#### Minimum-width integer types

The typedef name `int_leastN_t` designates a signed integer type with a width of at least  $N$ , such that no signed integer type with lesser size has at least the specified width. Thus, `int_least32_t` denotes a signed integer type with a width of at least 32 bits.

The typedef name `uint_leastN_t` designates an unsigned integer type with a width of at least  $N$ , such that no unsigned integer type with lesser size has at least the specified width. Thus, `uint_least16_t` denotes an unsigned integer type with a width of at least 16 bits.

The following types are required:

```
int_least8_t
int_least16_t
int_least32_t
int_least64_t
uint_least8_t
uint_least16_t
uint_least32_t
uint_least64_t
```

All other types of this form are optional.

#### Fastest minimum-width integer types

Each of the following types designates an integer type that is usually fastest to operate with among all integer types that have at least the specified width.

The designated type is not guaranteed to be fastest for all purposes; if the implementation has no clear grounds for choosing one type over another, it will simply pick some integer type satisfying the signedness and width requirements.

The typedef name `int_fastN_t` designates the fastest signed integer type with a width of at least *N*. The typedef name `uint_fastN_t` designates the fastest unsigned integer type with a width of at least *N*.

The following types are required:

```
int_fast8_t
int_fast16_t
int_fast32_t
int_fast64_t
uint_fast8_t
uint_fast16_t
uint_fast32_t
uint_fast64_t
```

All other types of this form are optional.

#### Integer types capable of holding object pointers

|                        |                                                                                                                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>intptr_t</code>  | Designates a signed integer type with the property that any valid pointer to void can be converted to this type, then converted back to a pointer to void, and the result will compare equal to the original pointer.    |
| <code>uintptr_t</code> | Designates an unsigned integer type with the property that any valid pointer to void can be converted to this type, then converted back to a pointer to void, and the result will compare equal to the original pointer. |

On standard-conforming systems, the `intptr_t` and `uintptr_t` types are required; otherwise, they are optional.

#### Greatest-width integer types

|                        |                                                                                                     |
|------------------------|-----------------------------------------------------------------------------------------------------|
| <code>intmax_t</code>  | Designates a signed integer type capable of representing any value of any signed integer type.      |
| <code>uintmax_t</code> | Designates an unsigned integer type capable of representing any value of any unsigned integer type. |

These types are required.

Applications can test for optional types by using the corresponding limit macro from `Limits of Specified-Width Integer Types`.

### Limits of Specified-Width Integer Types

The following macros specify the minimum and maximum limits of the types declared in the `<stdint.h>` header. Each macro name corresponds to a similar type name in `Integer Types`.

Each instance of any defined macro is replaced by a constant expression suitable for use in `#if` preprocessing directives. This expression has the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value is equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign, except where stated to be exactly the given value.

#### Limits of exact-width integer types

- Minimum values of exact-width signed integer types:
 

|            |                      |
|------------|----------------------|
| {INTN_MIN} | Exactly $-(2^{N-1})$ |
|------------|----------------------|
- Maximum values of exact-width signed integer types:
 

|            |                       |
|------------|-----------------------|
| {INTN_MAX} | Exactly $2^{N-1} - 1$ |
|------------|-----------------------|
- Maximum values of exact-width unsigned integer types:
 

|             |                   |
|-------------|-------------------|
| {UINTN_MAX} | Exactly $2^N - 1$ |
|-------------|-------------------|

#### Limits of minimum-width integer types

- Minimum values of minimum-width signed integer types:
 

|                  |                  |
|------------------|------------------|
| {INT_LEASTN_MIN} | $-(2^{N-1} - 1)$ |
|------------------|------------------|
- Maximum values of minimum-width signed integer types:
 

|                  |               |
|------------------|---------------|
| {INT_LEASTN_MAX} | $2^{N-1} - 1$ |
|------------------|---------------|
- Maximum values of minimum-width unsigned integer types:
 

|                   |           |
|-------------------|-----------|
| {UINT_LEASTN_MAX} | $2^N - 1$ |
|-------------------|-----------|

#### Limits of fastest minimum-width integer types

- Minimum values of fastest minimum-width signed integer types:
 

|                 |                  |
|-----------------|------------------|
| {INT_FASTN_MIN} | $-(2^{N-1} - 1)$ |
|-----------------|------------------|
- Maximum values of fastest minimum-width signed integer types:
 

|                 |               |
|-----------------|---------------|
| {INT_FASTN_MAX} | $2^{N-1} - 1$ |
|-----------------|---------------|
- Maximum values of fastest minimum-width unsigned integer types:
 

|                  |               |
|------------------|---------------|
| {UINT_FASTN_MAX} | $2^{N-1} - 1$ |
|------------------|---------------|

#### Limits of integer types capable of holding object pointers

- Minimum value of pointer-holding signed integer type:
 

|              |                 |
|--------------|-----------------|
| {INTPTR_MIN} | $-(2^{15} - 1)$ |
|--------------|-----------------|
- Maximum value of pointer-holding signed integer type:
 

|              |              |
|--------------|--------------|
| {INTPTR_MAX} | $2^{15} - 1$ |
|--------------|--------------|
- Minimum value of pointer-holding signed integer type:
 

|               |              |
|---------------|--------------|
| {UINTPTR_MAX} | $2^{16} - 1$ |
|---------------|--------------|

stdint.h(3HEAD)

#### Limits of greatest-width integer types

- Minimum value of greatest-width signed integer type:  
{INTMAX\_MIN}                     $-(2^{63} - 1)$
- Maximum value of greatest-width signed integer type:  
{INTMAX\_MIN}                     $2^{63} - 1$
- Maximum value of greatest-width unsigned integer type:  
{UINTMAX\_MIN}                    $2^{64} - 1$

#### Limits of Other Integer Types

The following macros specify the minimum and maximum limits of integer types corresponding to types defined in other standard headers.

Each instance of these macros is replaced by a constant expression suitable for use in `#if` preprocessing directives. This expression has the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value is equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign.

#### Limits of `ptrdiff_t`:

|               |        |
|---------------|--------|
| {PTRDIFF_MIN} | -65535 |
| {PTRDIFF_MAX} | +65535 |

#### Limits of `sig_atomic_t`:

|                  |            |
|------------------|------------|
| {SIG_ATOMIC_MIN} | See below. |
| {SIG_ATOMIC_MAX} | See below. |

#### Limits of `size_t`:

|            |       |
|------------|-------|
| {SIZE_MAX} | 65535 |
|------------|-------|

#### Limits of `wchar_t`:

|             |            |
|-------------|------------|
| {WCHAR_MIN} | See below. |
| {WCHAR_MAX} | See below. |

#### Limits of `wint_t`:

|            |            |
|------------|------------|
| {WINT_MIN} | See below. |
| {WINT_MAX} | See below. |

If `sig_atomic_t` (see the `<signal.h>` header) is defined as a signed integer type, the value of `{SIG_ATOMIC_MIN}` is no greater than -127 and the value of `{SIG_ATOMIC_MAX}` is no less than 127. Otherwise, `sig_atomic_t` is defined as an unsigned integer type, the value of `{SIG_ATOMIC_MIN}` is 0, and the value of `{SIG_ATOMIC_MAX}` is no less than 255.

If `wchar_t` (see the `<stddef.h>` header) is defined as a signed integer type, the value of `{WCHAR_MIN}` is no greater than -127 and the value of `{WCHAR_MAX}` is no less than 127. Otherwise, `wchar_t` is defined as an unsigned integer type, and the value of `{WCHAR_MIN}` is 0 and the value of `{WCHAR_MAX}` is no less than 255.

If `wint_t` (see the `<wchar.h>` header) is defined as a signed integer type, the value of `{WINT_MIN}` is no greater than -32767 and the value of `{WINT_MAX}` is no less than 32767. Otherwise, `wint_t` is defined as an unsigned integer type, and the value of `{WINT_MIN}` is 0 and the value of `{WINT_MAX}` is no less than 65535.

### Macros for Integer Constant Expressions

The following macros expand to integer constant expressions suitable for initializing objects that have integer types corresponding to types defined in the `<stdint.h>` header. Each macro name corresponds to a similar type name listed under minimum-width integer types and greatest-width integer types.

Each invocation of one of these macros expands to an integer constant expression suitable for use in `#if` preprocessing directives. The type of the expression has the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. The value of the expression is that of the argument. The argument in any instance of these macros is a decimal, octal, or hexadecimal constant with a value that does not exceed the limits for the corresponding type.

#### Macros for minimum-width integer constant expressions

The macro `INTN_C(value)` expands to an integer constant expression corresponding to the type `int_leastN_t`. The macro `UINTN_C(value)` expands to an integer constant expression corresponding to the type `uint_leastN_t`. For example, if `uint_least64_t` is a name for the type unsigned long long, then `UINT64_C(0x123)` might expand to the integer constant `0x123ULL`.

#### Macros for greatest-width integer constant expressions

The following macro expands to an integer constant expression having the value specified by its argument and the type `intmax_t`:

```
INTMAX_C(value)
```

The following macro expands to an integer constant expression having the value specified by its argument and the type `uintmax_t`:

```
UINTMAX_C(value)
```

| <b>NAME</b>        | stdio.h, stdio – standard buffered input/output                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>SYNOPSIS</b>    | #include <stdio.h>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>DESCRIPTION</b> | <p>The &lt;stdio.h&gt; header defines the following macros as positive integer constant expressions:</p> <p>BUFSIZ           size of &lt;stdio.h&gt; buffers</p> <p>_IOFBF           input/output fully buffered</p> <p>_IOLBF           input/output line buffered</p> <p>_IONBF           input/output unbuffered</p> <p>L_ctermid        maximum size of character array to hold ctermid() output</p> <p>L_tmpnam         maximum size of character array to hold tmpnam() output</p> <p>SEEK_CUR         seek relative to current position</p> <p>SEEK_END         seek relative to end-of-file</p> <p>SEEK_SET         seek relative to start-of-file</p> <p>The following macros are defined as positive integer constant expressions that denote implementation limits:</p> <p>{FILENAME_MAX}   Maximum size in bytes of the longest filename string that the implementation guarantees can be opened.</p> <p>{FOPEN_MAX}      Number of streams that the implementation guarantees can be open simultaneously. The value is at least eight.</p> <p>{TMP_MAX}        Minimum number of unique filenames generated by tmpnam(). Maximum number of times an application can call tmpnam() reliably. The value of {TMP_MAX} is at least 25. On XSI-conformant systems, the value of {TMP_MAX} is at least 10000.</p> <p>The following macro name is defined as a negative integer constant expression:</p> <p>EOF              end-of-file return value</p> <p>The following macro name is defined as a null pointer constant:</p> <p>NULL             null pointer</p> <p>The following macro name is defined as a string constant:</p> <p>P_tmpdir         default directory prefix for tmpnam()</p> <p>The following is defined as expressions of type “pointer to FILE” point to the FILE objects associated, respectively, with the standard error, input, and output streams:</p> <p>stderr           standard error output stream</p> <p>stdin            standard input stream</p> |

## stdio.h(3HEAD)

stdout            standard output stream

The following data types are defined through typedef:

FILE             structure containing information about a file

fpos\_t           non-array type containing all information needed to specify uniquely every position within a file

va\_list          as described in <stdarg.h>

size\_t           as described in <stddef.h>

**ATTRIBUTES**    See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO**      rename(2), ctermid(3C), fclose(3C), fdopen(3C), fflush(3C), fgetc(3C), fgetpos(3C), fgets(3C), flockfile(3C), fopen(3C), fputc(3C), fputs(3C), fputwc(3C), fread(3C), freopen(3C), fseek(3C), fsetpos(3C), ftell(3C), fwrite(3C), getwchar(3C), getopt(3C), perror(3C), popen(3C), printf(3C), remove(3C), rewind(3C), scanf(3C), setbuf(3C), stdio(3C), system(3C), tmpfile(3C), tmpnam(3C), ungetc(3C), vprintf(3C), attributes(5), standards(5)

**NAME** | stdlib.h, stdlib – standard library definitions

**SYNOPSIS** | #include <stdlib.h>

**DESCRIPTION** | The <stdlib.h> header defines the following macros:

EXIT\_FAILURE | Unsuccessful termination for `exit()`; evaluates to a non-zero value. See `exit(3C)`.

EXIT\_SUCCESS | Successful termination for `exit()`; evaluates to 0.

NULL | Null pointer.

{RAND\_MAX} | Maximum value returned by `rand()`; at least 32767. See `rand(3C)`.

{MB\_CUR\_MAX} | Integer expression whose value is the maximum number of bytes in a character specified by the current locale.

The following data types are defined through typedef:

div\_t | structure type returned by the `div()` function

ldiv\_t | structure type returned by the `ldiv()` function

lldiv\_t | structure type returned by the `lldiv()` function

size\_t | as described in <stddef.h>

wchar\_t | as described in <stddef.h>

See `div(3C)`, which covers `div()`, `ldiv()`, and `lldiv()`, and `stddef.h(3HEAD)`.

In addition, the symbolic names and macros listed below are defined as in <sys/wait.h>, for use in decoding the return value from `system()`. See `wait.h(3HEAD)` and `system(3C)`.

WNOHANG  
WUNTRACED  
WEXITSTATUS  
WIFEXITED  
WIFSIGNALED  
WIFSTOPPED  
WSTOPSIG  
WTERMSIG

**ATTRIBUTES** | See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

stdlib.h(3HEAD)

**NAME** string.h, string – string operations

**SYNOPSIS** #include <string.h>

**DESCRIPTION** The <string.h> header defines the following:

NULL                    null pointer constant

size\_t                    as described in <stddef.h>

**ATTRIBUTES** See attributes(5) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** memory(3C), strcoll(3C), string(3C), strxfrm(3C), [stddef.h\(3HEAD\)](#), [types.h\(3HEAD\)](#), attributes(5), standards(5)

strings.h(3HEAD)

**NAME** strings.h, strings – string operations

**SYNOPSIS** #include <strings.h>

**DESCRIPTION** The `size_t` type specified in <strings.h> is defined through typedef as described in <stddef.h>.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

| <b>NAME</b>        | stropts.h, stropts – STREAMS interface (STREAMS)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SYNOPSIS</b>    | <pre>#include &lt;stropts.h&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>DESCRIPTION</b> | <p>The &lt;stropts.h&gt; header defines the <code>bandinfo</code> structure, which includes the following members:</p> <pre>unsigned char bi_pri    /* priority band */ int          bi_flag   /* flushing type */</pre> <p>The &lt;stropts.h&gt; header defines the <code>strpeek</code> structure that includes the following members:</p> <pre>struct strbuf ctlbuf   /* control portion of the message */ struct strbuf databuf /* data portion of the message */ t_uscalar_t  flags    /* RS_HIPRI or 0 */</pre> <p>The &lt;stropts.h&gt; header defines the <code>strbuf</code> structure that includes the following members:</p> <pre>int  maxlen /* maximum buffer length */ int  len    /* length of data */ char *buf   /* pointer to buffer */</pre> <p>The &lt;stropts.h&gt; header defines the <code>strfdinsert</code> structure that includes the following members:</p> <pre>struct strbuf ctlbuf   /* control portion of the message */ struct strbuf databuf /* data portion of the message */ t_uscalar_t  flags    /* RS_HIPRI or 0 */ int          fildes   /* file descriptor of the other STREAM */ int          offset   /* relative location of the stored value */</pre> <p>The &lt;stropts.h&gt; header defines the <code>striocctl</code> structure that includes the following members:</p> <pre>int  ic_cmd    /* ioctl() command */ int  ic_timeout /* timeout for response */ int  ic_len    /* length of data */ char *ic_dp    /* pointer to buffer */</pre> <p>The &lt;stropts.h&gt; header defines the <code>strrecvfd</code> structure that includes the following members:</p> <pre>int  fda      /* received file descriptor */ uid_t uid    /* UID of sender */ gid_t gid    /* GID of sender */</pre> <p>The <code>uid_t</code> and <code>gid_t</code> types are defined through <code>typedef</code> as described in &lt;sys/types.h&gt;. See <a href="#">types.h(3HEAD)</a>.</p> <p>The &lt;stropts.h&gt; header defines the <code>t_scalar_t</code> and <code>t_uscalar_t</code> types, respectively, as signed and unsigned opaque types of equal length of at least 32 bits.</p> <p>The &lt;stropts.h&gt; header defines the <code>str_list</code> structure that includes the following members:</p> |

## stropts.h(3HEAD)

```
int          sl_nmods      /* number of STREAMS module names */
struct str_mlist *sl_modlist /* STREAMS module names */
```

The <stropts.h> header defines the `str_mlist` structure that includes the following member:

```
char l_name [FMNAMESZ+1]      a STREAMS module name
```

The following macros are defined for use as the request argument to `ioctl()`:

|                          |                                                               |
|--------------------------|---------------------------------------------------------------|
| <code>I_PUSH</code>      | Push a STREAMS module.                                        |
| <code>I_POP</code>       | Pop a STREAMS module.                                         |
| <code>I_LOOK</code>      | Get the top module name.                                      |
| <code>I_FLUSH</code>     | Flush a STREAM.                                               |
| <code>I_FLUSHBAND</code> | Flush one band of a STREAM.                                   |
| <code>I_SETSIG</code>    | Ask for notification signals.                                 |
| <code>I_GETSIG</code>    | Retrieve current notification signals.                        |
| <code>I_FIND</code>      | Look for a STREAMS module.                                    |
| <code>I_PEEK</code>      | Peek at the top message on a STREAM.                          |
| <code>I_SRDOPT</code>    | Set the read mode.                                            |
| <code>I_GRDOPT</code>    | Get the read mode.                                            |
| <code>I_NREAD</code>     | Size the top message.                                         |
| <code>I_FDINSERT</code>  | Send implementation-defined information about another STREAM. |
| <code>I_STR</code>       | Send a STREAMS <code>ioctl()</code> .                         |
| <code>I_SWROPT</code>    | Set the write mode.                                           |
| <code>I_GWROPT</code>    | Get the write mode.                                           |
| <code>I_SENDFD</code>    | Pass a file descriptor through a STREAMS pipe.                |
| <code>I_RECVFD</code>    | Get a file descriptor sent via <code>I_SENDFD</code> .        |
| <code>I_LIST</code>      | Get all the module names on a STREAM.                         |
| <code>I_ATMARK</code>    | Is the top message “marked”?                                  |
| <code>I_CKBAND</code>    | See if any messages exist in a band.                          |
| <code>I_GETBAND</code>   | Get the band of the top message on a STREAM.                  |
| <code>I_CANPUT</code>    | Is a band writable?                                           |
| <code>I_SETCLTIME</code> | Set close time delay.                                         |
| <code>I_GETCLTIME</code> | Get close time delay.                                         |

|                        |                                      |
|------------------------|--------------------------------------|
| <code>I_LINK</code>    | Connect two STREAMs.                 |
| <code>I_UNLINK</code>  | Disconnect two STREAMs.              |
| <code>I_PLINK</code>   | Persistently connect two STREAMs.    |
| <code>I_PUNLINK</code> | Dismantle a persistent STREAMs link. |

The following macro is defined for use with `I_LOOK`:

|                       |                                                                                  |
|-----------------------|----------------------------------------------------------------------------------|
| <code>FMNAMESZ</code> | minimum size in bytes of the buffer referred to by the <code>arg</code> argument |
|-----------------------|----------------------------------------------------------------------------------|

The following macros are defined for use with `I_FLUSH`:

|                      |                             |
|----------------------|-----------------------------|
| <code>FLUSHR</code>  | flush read queues           |
| <code>FLUSHW</code>  | flush write queues          |
| <code>FLUSHRW</code> | flush read and write queues |

The following macros are defined for use with `I_SETSIG`:

|                        |                                                                                                                                                                                                            |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>S_RDNORM</code>  | A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue.                                                                                                             |
| <code>S_RDBAND</code>  | A message with a non-zero priority band has arrived at the head of a STREAM head read queue.                                                                                                               |
| <code>S_INPUT</code>   | A message, other than a high-priority message, has arrived at the head of a STREAM head read queue.                                                                                                        |
| <code>S_HIPRI</code>   | A high-priority message is present on a STREAM head read queue.                                                                                                                                            |
| <code>S_OUTPUT</code>  | The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream. |
| <code>S_WRNORM</code>  | Equivalent to <code>S_OUTPUT</code> .                                                                                                                                                                      |
| <code>S_WRBAND</code>  | The write queue for a non-zero priority band just below the STREAM head is no longer full.                                                                                                                 |
| <code>S_MSG</code>     | A STREAMs signal message that contains the <code>SIGPOLL</code> signal reaches the front of the STREAM head read queue.                                                                                    |
| <code>S_ERROR</code>   | Notification of an error condition reaches the STREAM head.                                                                                                                                                |
| <code>S_HANGUP</code>  | Notification of a hangup reaches the STREAM head.                                                                                                                                                          |
| <code>S_BANDURG</code> | When used in conjunction with <code>S_RDBAND</code> , <code>SIGURG</code> is generated instead of <code>SIGPOLL</code> when a priority message reaches the front of the STREAM head read queue.            |

The following macro is defined for use with `I_PEEK`:

## stropts.h(3HEAD)

**RS\_HIPRI** Only look for high-priority messages.

The following macros are defined for use with `I_SRDOPT`:

**RNORM** Byte-STREAM mode, the default.

**RMSGD** Message-discard mode.

**RMSGN** Message-non-discard mode.

**RPROTNORM** Fail `read()` with `[EBADMSG]` if a message containing a control part is at the front of the STREAM head read queue.

**RPROTDAT** Deliver the control part of a message as data when a process issues a `read()`

**RPROTDIS** Discard the control part of a message, delivering any data part, when a process issues a `read()`

The following macro is defined for use with `I_SWOPT`:

**SNDZERO** Send a zero-length message downstream when a `write()` of 0 bytes occurs.

The following macros are defined for use with `I_ATMARK`:

**ANYMARK** Check if the message is marked.

**LASTMARK** Check if the message is the last one marked on the queue.

The following macro is defined for use with `I_UNLINK`:

**MUXID\_ALL** Unlink all STREAMs linked to the STREAM associated with `fildes`.

The following macros are defined for `getmsg()`, `getpmsg()`, `putmsg()`, and `putpmsg()`:

**MSG\_ANY** Receive any message.

**MSG\_BAND** Receive message from specified band.

**MSG\_HIPRI** Send/receive high-priority message.

**MORECTL** More control information is left in message.

**MOREDATA** More data is left in message.

The `<stropts.h>` header can make visible all of the symbols from `<unistd.h>`.

### ATTRIBUTES

See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

| LOG_MASK( <i>pri</i> ) | a mask for priority <i>pri</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |         |                                       |          |                                     |            |                                       |            |                                                   |            |                                  |          |                                              |          |                                |          |                                               |          |                                               |          |                                               |            |                                                 |          |                                                        |          |                                                |         |                                                  |            |                        |            |                        |            |                        |            |                        |            |                        |            |                        |            |                        |            |                        |                        |                                |

The following constants are defined as possible values for the *priority* argument of `syslog()`:

|                          |                                                   |
|--------------------------|---------------------------------------------------|
| <code>LOG_EMERG</code>   | A panic condition was reported to all processes.  |
| <code>LOG_ALERT</code>   | A condition that should be corrected immediately. |
| <code>LOG_CRIT</code>    | A critical condition.                             |
| <code>LOG_ERR</code>     | An error message.                                 |
| <code>LOG_WARNING</code> | A warning message.                                |
| <code>LOG_NOTICE</code>  | A condition requiring special handling.           |
| <code>LOG_INFO</code>    | A general information message.                    |
| <code>LOG_DEBUG</code>   | A message useful for debugging programs.          |

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

## tar.h(3HEAD)

|                    |                                                                                    |
|--------------------|------------------------------------------------------------------------------------|
| <b>NAME</b>        | tar.h, tar – extended tar definitions                                              |
| <b>SYNOPSIS</b>    | <code>#include &lt;tar.h&gt;</code>                                                |
| <b>DESCRIPTION</b> | The <code>&lt;tar.h&gt;</code> header defines header block definitions as follows. |

| Name     | Description | Value                  |
|----------|-------------|------------------------|
| TMAGIC   | "ustar"     | ustar plus null byte   |
| TMAGLEN  | 6           | length of the above    |
| TVERSION | "00"        | 00 without a null byte |
| TVERSLEN | 2           | length of the above    |

Typeflag field definitions:

| Name     | Description | Value             |
|----------|-------------|-------------------|
| REGTYPE  | '0'         | regular file      |
| AREGTYPE | '\0'        | regular file      |
| LNKTYPE  | '1'         | link              |
| SYMTYPE  | '2'         | symbolic link     |
| CHRTYPE  | '3'         | character special |
| BLKTYPE  | '4'         | block special     |
| DIRTYPE  | '5'         | directory         |
| FIFOTYPE | '6'         | FIFO special      |
| CONTTYPE | '7'         | reserved          |

Mode field bit definitions (octal):

| Name    | Description | Value                                    |
|---------|-------------|------------------------------------------|
| TSUID   | 04000       | set UID on execution                     |
| TSGID   | 02000       | set GID on execution                     |
| TSVTX   | 01000       | on directories, restricted deletion flag |

tcp.h(3HEAD)

**NAME** tcp.h, tcp – definitions for the Internet Transmission Control Protocol (TCP)

**SYNOPSIS** #include <netinet/tcp.h>

**DESCRIPTION** The <netinet/tcp.h> header defines the following macro for use as a socket option at the IPPROTO\_TCP level:

TCP\_NODELAY      Avoid coalescing of small segments.

The macro is defined in the header. The implementation need not allow the value of the option to be set with `setsockopt()` or retrieved with `getsockopt()`.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** `getsockopt(3XNET)`, `socket.h(3HEAD)`, `attributes(5)`, `standards(5)`

**NAME** | termios.h, termios – define values for termios

**SYNOPSIS** | #include <termios.h>

**DESCRIPTION** | The <termios.h> header contains the definitions used by the terminal I/O interfaces. See `termios(3C)` and `termio(7I)` for an overview of the terminal interface.

**The termios Structure**

The following data types are defined through typedef:

```
cc_t           used for terminal special characters
speed_t       used for terminal baud rates
tcflag_t      used for terminal modes
```

The above types are all unsigned integer types.

The implementation supports one or more programming environments in which the widths of `cc_t`, `speed_t`, and `tcflag_t` are no greater than the width of type `long`. The names of these programming environments can be obtained using the `confstr(3C)` function or the `getconf(1)` utility.

The `termios` structure is defined and includes the following members:

```
tcflag_t c_iflag      /* input modes */
tcflag_t c_oflag      /* output modes */
tcflag_t c_cflag      /* control modes */
tcflag_t c_lflag      /* local modes */
cc_t     c_cc[NCCS]   /* control characters */
```

A definition is provided for:

```
NCCS           size of the array c_cc for control characters
```

The following subscript names for the array `c_cc` are defined:

| Subscript Usage<br>Canonical Mode | Subscript Usage<br>Non-Canonical Mode | Description     |
|-----------------------------------|---------------------------------------|-----------------|
| VEOF                              |                                       | EOF character   |
| VEOL                              |                                       | EOL character   |
| VERASE                            |                                       | ERASE character |
| VINTR                             | VINTR                                 | INTR character  |
| VKILL                             |                                       | KILL character  |
|                                   | VMIN                                  | MIN value       |
| VQUIT                             | VQUIT                                 | QUIT character  |
| VSTART                            | VSTART                                | START character |

| <b>Subscript Usage</b><br><b>Canonical Mode</b> | <b>Subscript Usage</b><br><b>Non-Canonical Mode</b> | <b>Description</b> |
|-------------------------------------------------|-----------------------------------------------------|--------------------|
| VSTOP                                           | VSTOP                                               | STOP character     |
| VSUSP                                           | VSUSP                                               | SUSP character     |
|                                                 | VTIME                                               | TIME value         |

The subscript values are unique, except that the `VMIN` and `VTIME` subscripts can have the same values as the `VEOF` and `VEOL` subscripts, respectively.

The header file provides the flags described below.

**Input Modes**

The `c_iflag` field describes the basic terminal input control:

|                     |                                         |
|---------------------|-----------------------------------------|
| <code>BRKINT</code> | Signal interrupt on break.              |
| <code>ICRNL</code>  | Map CR to NL on input.                  |
| <code>IGNBRK</code> | Ignore break condition.                 |
| <code>IGNCR</code>  | Ignore CR.                              |
| <code>IGNPAR</code> | Ignore characters with parity errors.   |
| <code>INLCR</code>  | Map NL to CR on input.                  |
| <code>INPCK</code>  | Enable input parity check.              |
| <code>ISTRIP</code> | Strip character.                        |
| <code>IXANY</code>  | Enable any character to restart output. |
| <code>IXOFF</code>  | Enable start/stop input control.        |
| <code>IXON</code>   | Enable start/stop output control.       |
| <code>PARMRK</code> | Mark parity errors.                     |

**Output Modes**

The `c_oflag` field specifies the system treatment of output:

|                     |                                 |
|---------------------|---------------------------------|
| <code>OPOST</code>  | Post-process output.            |
| <code>ONLCR</code>  | Map NL to CR-NL on output.      |
| <code>OCRNL</code>  | Map CR to NL on output.         |
| <code>ONOCR</code>  | No CR output at column 0.       |
| <code>ONLRET</code> | NL performs CR function.        |
| <code>OFILL</code>  | Use fill characters for delay.  |
| <code>NLDLY</code>  | Select newline delays:          |
|                     | <code>NL0</code> newline type 0 |

|        |      |                                |
|--------|------|--------------------------------|
|        | NL1  | newline type 1                 |
| CRDLY  |      | Select carriage-return delays: |
|        | CR0  | carriage-return delay type 0   |
|        | CR1  | carriage-return delay type 1   |
|        | CR2  | carriage-return delay type 2   |
|        | CR3  | carriage-return delay type 3   |
| TABDLY |      | Select horizontal-tab delays:  |
|        | TAB0 | horizontal-tab delay type 0    |
|        | TAB1 | horizontal-tab delay type 1    |
|        | TAB2 | horizontal-tab delay type 2    |
|        | TAB3 | expand tabs to spaces          |
| BSDLY  |      | Select backspace delays:       |
|        | BS0  | backspace-delay type 0         |
|        | BS1  | backspace-delay type 1         |
| VTDLY  |      | Select vertical-tab delays:    |
|        | VT0  | vertical-tab delay type 0      |
|        | VT1  | vertical-tab delay type 1      |
| FFDLY  |      | Select form-feed delays:       |
|        | FF0  | form-feed delay type 0         |
|        | FF1  | form-feed delay type 1         |

**Baud Rate Selection**

The input and output baud rates are stored in the `termios` structure. These are the valid values for objects of type `speed_t`. The following values are defined, but not all baud rates need be supported by the underlying hardware.

|      |            |
|------|------------|
| B0   | Hang up    |
| B50  | 50 baud    |
| B75  | 75 baud    |
| B110 | 110 baud   |
| B134 | 134.5 baud |
| B150 | 150 baud   |
| B200 | 200 baud   |
| B300 | 300 baud   |
| B600 | 600 baud   |

termios.h(3HEAD)

|        |             |
|--------|-------------|
| B1200  | 1 200 baud  |
| B1800  | 1 800 baud  |
| B2400  | 2 400 baud  |
| B4800  | 4 800 baud  |
| B9600  | 9 600 baud  |
| B19200 | 19 200 baud |
| B38400 | 38 400 baud |

**Control Modes** The `c_cflag` field describes the hardware control of the terminal; not all values specified are required to be supported by the underlying hardware:

|        |                               |
|--------|-------------------------------|
| CSIZE  | Character size:               |
|        | CS5      5 bits               |
|        | CS6      6 bits               |
|        | CS7      7 bits               |
|        | CS8      8 bits               |
| CSTOPB | Send two stop bits, else one. |
| CREAD  | Enable receiver.              |
| PARENB | Parity enable.                |
| PARODD | Odd parity, else even.        |
| HUPCL  | Hang up on last close.        |
| CLOCAL | Ignore modem status lines.    |

The implementation supports the functionality associated with the symbols `CS7`, `CS8`, `CSTOPB`, `PARODD`, and `PARENB`.

**Local Modes** The `c_lflag` field of the argument structure is used to control various terminal functions:

|        |                                                     |
|--------|-----------------------------------------------------|
| ECHO   | Enable echo.                                        |
| ECHOE  | Echo erase character as error-correcting backspace. |
| ECHOK  | Echo KILL.                                          |
| ECHONL | Echo NL.                                            |
| ICANON | Canonical input (erase and kill processing).        |
| IEXTEN | Enable extended input character processing.         |
| ISIG   | Enable signals.                                     |
| NOFLSH | Disable flush after interrupt or quit.              |

**Attribute Selection** TOSTOP Send SIGTTOU for background output.

The following symbolic constants for use with `tcsetattr()` are defined:

TCSANOW Change attributes immediately.

TCSADRAIN Change attributes when output has drained.

TCSAFLUSH Change attributes when output has drained; also flush pending input.

**Line Control** The following symbolic constants for use with `tcflush()` are defined:

TCIFLUSH Flush pending input.

TCIOFLUSH Flush both pending input and untransmitted output.

TCOFLUSH Flush untransmitted output.

The following symbolic constants for use with `tcflow()` are defined:

TCIOFF Transmit a STOP character, intended to suspend input data.

TCION Transmit a START character, intended to restart input data.

TCOOFF Suspend output.

TCOON Restart output.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** `getconf(1)`, `cfgetispeed(3C)`, `cfsetispeed(3C)`, `confstr(3C)`, `tcdrain(3C)`, `tcflow(3C)`, `tcflush(3C)`, `tcgetattr(3C)`, `tcgetsid(3C)`, `tcsendbreak(3C)`, `tcsetattr(3C)`, `attributes(5)`, `standards(5)`

## tgmath.h(3HEAD)

**NAME** tgmath.h, tgmath – type-generic macros

**SYNOPSIS** #include <tgmath.h>

**DESCRIPTION** The <tgmath.h> header includes the headers <math.h> and <complex.h> and defines several type-generic macros.

Of the functions contained within the <math.h> and <complex.h> headers without an `f` (float) or `l` (long double) suffix, several have one or more parameters whose corresponding real type is `double`. For each such function except `modf(3M)`, there is a corresponding type-generic macro. The parameters whose corresponding real type is `double` in the function synopsis are generic parameters. Use of the macro invokes a function whose corresponding real type and type domain are determined by the arguments for the generic parameters.

Use of the macro invokes a function whose generic parameters have the corresponding real type determined as follows:

- First, if any argument for generic parameters has type `long double`, the type determined is `long double`.
- Otherwise, if any argument for generic parameters has type `double` or is of integer type, the type determined is `double`.
- Otherwise, the type determined is `float`.

For each unsuffixed function in the <math.h> header for which there is a function in the <complex.h> header with the same name except for a `c` prefix, the corresponding type-generic macro (for both functions) has the same name as the function in the <math.h> header. The corresponding type-generic macro for `fabs()` and `cabs()` is `fabs()`.

| <math.h> Function    | <complex.h> Function  | Type-Generic Macro   |
|----------------------|-----------------------|----------------------|
| <code>acos()</code>  | <code>cacos()</code>  | <code>acos()</code>  |
| <code>asin()</code>  | <code>casin()</code>  | <code>asin()</code>  |
| <code>atan()</code>  | <code>catan()</code>  | <code>atan()</code>  |
| <code>acosh()</code> | <code>cacosh()</code> | <code>acosh()</code> |
| <code>asinh()</code> | <code>casinh()</code> | <code>asinh()</code> |
| <code>atanh()</code> | <code>catanh()</code> | <code>atanh()</code> |
| <code>cos()</code>   | <code>ccos()</code>   | <code>cos()</code>   |
| <code>sin()</code>   | <code>csin()</code>   | <code>sin()</code>   |
| <code>tan()</code>   | <code>ctan()</code>   | <code>tan()</code>   |
| <code>cosh()</code>  | <code>ccosh()</code>  | <code>cosh()</code>  |

| <code>&lt;math.h&gt;</code> Function | <code>&lt;complex.h&gt;</code> Function | Type-Generic Macro  |
|--------------------------------------|-----------------------------------------|---------------------|
| <code>sinh()</code>                  | <code>csinh()</code>                    | <code>sinh()</code> |
| <code>tanh()</code>                  | <code>ctanh()</code>                    | <code>tanh()</code> |
| <code>exp()</code>                   | <code>cexp()</code>                     | <code>exp()</code>  |
| <code>log()</code>                   | <code>clog()</code>                     | <code>log()</code>  |
| <code>pow()</code>                   | <code>cpow()</code>                     | <code>pow()</code>  |
| <code>sqrt()</code>                  | <code>csqrt()</code>                    | <code>sqrt()</code> |
| <code>fabs()</code>                  | <code>cfabs()</code>                    | <code>fabs()</code> |

If at least one argument for a generic parameter is complex, then use of the macro invokes a complex function; otherwise, use of the macro invokes a real function.

For each unsuffixed function in the `<math.h>` header without a `c`-prefixed counterpart in the `<complex.h>` header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

```
atan2()      fma()      llround()    remainder()
cbrt()      fmax()     log10()     remquo()
ceil()      fmin()     log1p()     rint()
copysign()  fmod()     log2()     round()
erf()       frexp()   logb()     scalbn()
erfc()      hypot()   lrint()    scalbln()
exp2()      ilogb()  lround()   tgamma()
expm1()     ldexp()   nearbyint() trunc()
fdim()      lgamma()  nextafter()
floor()     llrint()  nexttoward()
```

If all arguments for generic parameters are real, then use of the macro invokes a real function; otherwise, use of the macro results in undefined behavior.

For each unsuffixed function in the `<complex.h>` header that is not a `c`-prefixed counterpart to a function in the `<math.h>` header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

```
carg()
cimag()
conj()
cproj()
creal()
```

Use of the macro with any real or complex argument invokes a complex function.

**USAGE** Functions invoked by use of type-generic macros are invoked with the declarations listed below.

```
#include <tgmath.h>
int n;
float f;
```

## tgmath.h(3HEAD)

```
double d;  
long double ld;  
float complex fc;  
double complex dc;  
long double complex ldc;
```

The following are the type-generic macros that invoke the functions that are invoked with the preceding declarations.

| Macro            | Use Invokes                   |
|------------------|-------------------------------|
| exp(n)           | exp(n), the function          |
| acosh(f)         | acosh(f)                      |
| sin(d)           | sin(d), the function          |
| atan(ld)         | atanl(ld)                     |
| log(fc)          | clogf(fc)                     |
| sqrt(dc)         | csqrt(dc)                     |
| pow(ldc,f)       | cpowl(ldc, f)                 |
| remainder(n,n)   | remainder(n, n), the function |
| nextafter(d,f)   | nextafter(d, f), the function |
| nexttoward(f,ld) | nexttowardf(f, ld)            |
| copysign(n,ld)   | copysignl(n, ld)              |
| ceil(fc)         | undefined behavior            |
| rint(dc)         | undefined behavior            |
| fmax(ldc,ld)     | undefined behavior            |
| carg(n)          | carg(n), the function         |
| cproj(f)         | cprojf(f)                     |
| creal(d)         | creal(d), the function        |
| cimag(ld)        | cimagl(ld)                    |
| cabs(fc)         | cabsf(fc)                     |
| carg(dc)         | carg(dc), the function        |
| cproj(ldc)       | cprojl(ldc)                   |

| <b>NAME</b>        | time.h, time – time types                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>SYNOPSIS</b>    | <pre>#include &lt;time.h&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>DESCRIPTION</b> | <p>The <code>&lt;time.h&gt;</code> header declares the structure <code>tm</code>, which includes the following members:</p> <pre>int tm_sec      /* seconds [0,60] */ int tm_min      /* minutes [0,59] */ int tm_hour     /* hour [0,23] */ int tm_mday     /* day of month [1,31] */ int tm_mon      /* month of year [0,11] */ int tm_year     /* years since 1900 */ int tm_wday     /* day of week [0,6] (Sunday =0) */ int tm_yday     /* day of year [0,365] */ int tm_isdst    /* daylight savings flag */</pre> <p>The value of <code>tm_isdst</code> is positive if Daylight Saving Time is in effect, 0 if Daylight Saving Time is not in effect, and negative if the information is not available.</p> <p>The <code>&lt;time.h&gt;</code> header defines the following symbolic names:</p> <p><b>NULL</b><br/>Null pointer constant.</p> <p><b>CLOCKS_PER_SEC</b><br/>A number used to convert the value returned by the <code>clock()</code> function into seconds. See <code>clock(3C)</code>.</p> <p><b>CLOCK_PROCESS_CPUTIME_ID</b><br/>The identifier of the CPU-time clock associated with the process making a <code>clock()</code> or <code>timer*()</code> function call.</p> <p><b>CLOCK_THREAD_CPUTIME_ID</b><br/>The identifier of the CPU-time clock associated with the thread making a <code>clock()</code> or <code>timer*()</code> function call.</p> <p>The <code>&lt;time.h&gt;</code> header declares the <code>timespec</code> structure, which has the following members:</p> <pre>time_t tv_sec   /* seconds */ long   tv_nsec  /* nanoseconds */</pre> <p>The <code>&lt;time.h&gt;</code> header declares the <code>itimerspec</code> structure, which has the following members:</p> <pre>struct timespec it_interval /* timer period */ struct timespec it_value    /* timer expiration */</pre> <p>The following manifest constants are defined:</p> <p><b>CLOCK_REALTIME</b>           The identifier of the system-wide realtime clock.</p> <p><b>TIMER_ABSTIME</b>           Flag indicating time is absolute. For functions taking timer objects, this refers to the clock associated with the timer.</p> |

## time.h(3HEAD)

**CLOCK\_MONOTONIC** The identifier for the system-wide monotonic clock, which is defined as a clock whose value cannot be set with `clock_gettime()` and that cannot have backward clock jumps. The maximum possible clock jump is implementation-defined. See `clock_gettime(3RT)`.

The `clock_t`, `size_t`, `time_t`, `clockid_t`, and `timer_t` types are defined as described in `<sys/types.h>`. See `types.h(3HEAD)`.

Although the value of `CLOCKS_PER_SEC` is required to be 1 million on all standard-conforming systems, it can be variable on other systems, and it should not be assumed that `CLOCKS_PER_SEC` is a compile-time constant.

The `<time.h>` header provides a declaration for `getdate_err`.

The following are declared as variables:

```
extern int daylight;
extern long timezone;
extern char *tzname[];
```

Inclusion of the `<time.h>` header can make visible all symbols from the `<signal.h>` header.

**USAGE** The range `[0,60]` for `tm_sec` allows for the occasional leap second.

`tm_year` is a signed value; therefore, years before 1900 can be represented.

To obtain the number of clock ticks per second returned by the `times()` function, applications should call `sysconf(_SC_CLK_TCK)`. See `times(2)` and `sysconf(3C)`.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** `time(2)`, `utime(2)`, `clock(3C)`, `ctime(3C)`, `difftime(3C)`, `getdate(3C)`, `mktime(3C)`, `strftime(3C)`, `strptime(3C)`, `types.h(3HEAD)`, `clock_gettime(3RT)`, `nanosleep(3RT)`, `timer_create(3RT)`, `timer_delete(3RT)`, `timer_settime(3RT)`, `attributes(5)`, `standards(5)`

**NAME** times.h, times – file access and modification times structure

**SYNOPSIS**

```
#include <sys/times.h>
```

**DESCRIPTION** The `<sys/times.h>` header defines the structure `tms`, which is returned by `times()` and includes the following members:

```
clock_t tms_utime      /* user CPU time */
clock_t tms_stime     /* system CPU time */
clock_t tms_cutime    /* user CPU time of terminated child processes */
clock_t tms_cstime    /* system CPU time of terminated child processes */
```

The `clock_t` type is defined as described in `<sys/types.h>`.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** `times(2)`, `types.h(3HEAD)`, `attributes(5)`, `standards(5)`

```

### Preprocessor Symbols

For 32-bit programs, pointers and the C data types `int` and `long` are all 32-bit quantities. For 64-bit programs, pointers and the C data type `long` are defined as 64-bit quantities.

The preprocessor symbol `_ILP32`, made visible by the inclusion of `<sys/types.h>`, can be used with the preprocessor `#ifdef` construct to define sections of code that will be compiled only as part of a 32-bit version of a given C program.

The preprocessor symbol `_LP64` can be used in the same way to define sections of code that will be compiled only as part of a 64-bit version of a given C program. See **EXAMPLES**.

This header incorporates definitions of other preprocessor symbols that can be useful when keeping code portable between different instruction set architectures.

`_LITTLE_ENDIAN`

`_BIG_ENDIAN`

The natural byte order of the processor. A pointer to an `int` points to the least/most significant byte of that `int`.

`_STACK_GROWS_UPWARD`

`_STACK_GROWS_DOWNWARD`

The processor specific direction of stack growth. A push onto the stack increases/decreases the stack pointer, so it stores data at successively higher/lower addresses.

`_CHAR_IS_UNSIGNED`

`_CHAR_IS_SIGNED`

The C Compiler implements objects of type `char` as `unsigned` or `signed` respectively. This is really an implementation choice of the compiler, but it is specified in the ABI and tends to be uniform across compilers for an instruction set architecture.

`_CHAR_ALIGNMENT`

`_SHORT_ALIGNMENT`

`_INT_ALIGNMENT`

`_LONG_ALIGNMENT`

`_LONG_LONG_ALIGNMENT`

`_DOUBLE_ALIGNMENT`

`_LONG_DOUBLE_ALIGNMENT`

`_POINTER_ALIGNMENT`

`_FLOAT_ALIGNMENT`

The ABI defines alignment requirements of each of the primitive object types. Some, if not all, might be hardware requirements as well. The values are expressed in bytes.

`_MAX_ALIGNMENT`

The most stringent alignment requirement as specified by the ABI. Equal to the maximum of all the above `_XXX_ALIGNMENT` values.

`_LONG_LONG_ALIGNMENT_32`

The 32-bit ABI supported by a 64-bit kernel may have different alignment requirements for primitive object types. The value of this identifier is expressed in bytes.

**USAGE** The `daddr_t` type is used for disk addresses except in an inode on disk. Times are encoded in seconds since 00:00:00 UTC, January 1, 1970. The major and minor parts of a device code specify kind and unit number of a device and are installation-dependent. Offsets are measured in bytes from the beginning of a file.

The `label_t[ ]` types are used to save the processor state while another process is running.

**EXAMPLES** **EXAMPLE 1** Use of preprocessor symbol `_LP64`.

In the following example, the preprocessor symbol `_LP64` defines sections of code that will be compiled only as part of a 64-bit version of the given C program.

```
#include <sys/types.h>
...

#ifdef _LP64
    printf("The data model is LP64 in this environment\n");
#else
#ifdef _ILP32
    printf("The data model is ILP32 in this environment\n");
#else
#error "Unknown data model!"
#endif
#endif
```

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| <b>DESCRIPTION</b>  | <p>The &lt;ucontext.h&gt; header defines the <code>ucontext_t</code> type as a structure that includes at least the following members:</p> <pre>ucontext_t  uc_link sigset_t    uc_sigmask stack_t     uc_stack mcontext_t  uc_mcontext</pre> <p>The <code>uc_link</code> member is a pointer to the context that to be resumed when this context returns. If <code>uc_link</code> is equal to 0, this context is the main context and the process exits when this context returns.</p> <p>The <code>uc_sigmask</code> member defines the set of signals that are blocked when this context is active. See <code>sigprocmask(2)</code>.</p> <p>The <code>uc_stack</code> member defines the stack used by this context. See <code>sigaltstack(2)</code>.</p> <p>The <code>uc_mcontext</code> member contains the saved set of machine registers and any implementation-specific context data. Portable applications should not modify or access <code>uc_mcontext</code>.</p> |                |                 |                     |          |
| <b>ATTRIBUTES</b>   | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                |                 |                     |          |

| <b>SYNOPSIS</b>     | <pre>#include &lt;sys/uio.h&gt;</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                |                 |                     |          |
| <b>DESCRIPTION</b>  | <p>The <code>&lt;sys/uio.h&gt;</code> header defines the <code>iovec</code> structure, which includes the following members:</p> <pre>void    *iov_base    /* base address of a memory region for input or output */ size_t  iov_len     /* size of the memory pointed to by iov_base */</pre> <p>The <code>&lt;sys/uio.h&gt;</code> header uses the <code>iovec</code> structure for scatter/gather I/O.</p> <p>The <code>ssize_t</code> and <code>size_t</code> types are defined as described in <code>&lt;sys/types.h&gt;</code>.</p> |                |                 |                     |          |
| <b>USAGE</b>        | The symbol <code>{IOV_MAX}</code> defined in <code>&lt;limits.h&gt;</code> should always be used to learn about the limits on the number of scatter/gather elements that can be processed in one call, instead of assuming a fixed value.                                                                                                                                                                                                                                                                                                 |                |                 |                     |          |
| <b>ATTRIBUTES</b>   | See <code>attributes(5)</code> for descriptions of the following attributes:                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                |                 |                     |          |

## ulimit.h(3HEAD)

**NAME** ulimit.h, ulimit – ulimit commands

**SYNOPSIS** #include <ulimit.h>

**DESCRIPTION** The <ulimit.h> header defines the following symbolic constants used by the `ulimit()` function.

UL\_GETFSIZE     Get maximum file size.

UL\_SETFSIZE     Set maximum file size.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** `ulimit(2)`, `attributes(5)`, `standards(5)`

**NAME** | un.h, un – definitions for UNIX-domain sockets

**SYNOPSIS** | `#include <sys/un.h>`

**DESCRIPTION** | The `<sys/un.h>` header defines the `sockaddr_un` structure that includes the following members:

```
sa_family_t  sun_family  /* address family */
char         sun_path[]  /* socket pathname */
```

The `sockaddr_un` structure is used to store addresses for UNIX domain sockets. Values of this type must be cast to `struct sockaddr` for use with the socket interfaces.

The `<sys/un.h>` header defines the type `sa_family_t` as described in [socket.h\(3HEAD\)](#).

**ATTRIBUTES** | See [attributes\(5\)](#) for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

**SEE ALSO** | [bind\(3SOCKET\)](#), [bind\(3XNET\)](#), [socket.h\(3HEAD\)](#), [socket\(3SOCKET\)](#), [socket\(3XNET\)](#), [socketpair\(3SOCKET\)](#), [socketpair\(3XNET\)](#), [attributes\(5\)](#), [standards\(5\)](#)

| <code>_XOPEN_XCU_VERSION</code>     | Integer value indicating the version of the XCU specification to which the implementation conforms. If this constant is not defined, use the <code>sysconf(3C)</code> function to determine which features are supported. This constant is not defined for the SUSv3 environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                             |                                                                                                |                              |                                                                      |                                |                                                                                |                             |                                                                       |                                 |                                                                                                                                                                                                                                                                                   |
| <b>Mandatory Symbolic Constants</b> | <p>The following symbolic constants, if defined in &lt;unistd.h&gt;, have a value of -1, 0, or greater, unless otherwise specified below. If these are undefined, the <code>fpathconf(2)</code>, <code>pathconf(2)</code>, or <code>sysconf(3C)</code> functions can be used to determine whether the option is provided for a particular invocation of the application.</p> <p>If a symbolic constant is defined with the value -1, the option is not supported. Headers, data types, and function interfaces required only for the option need not be supplied. An application that attempts to use anything associated only with the option is considered to be requiring an extension.</p> <p>If a symbolic constant is defined with a value greater than zero, the option is always supported when the application is executed. All headers, data types, and functions are present and operate as specified.</p> <p>If a symbolic constant is defined with the value zero, all headers, data types, and functions are present. The application can check at runtime to see whether the option is supported by calling <code>fpathconf()</code>, <code>pathconf()</code>, or <code>sysconf()</code> with the indicated <i>name</i> parameter.</p> <p>Unless explicitly specified otherwise, the behavior of functions associated with an unsupported option is unspecified, and an application that uses such functions without first checking <code>fpathconf()</code>, <code>pathconf()</code>, or <code>sysconf()</code> is considered to be requiring an extension.</p> |                             |                                                                                                |                              |                                                                      |                                |                                                                                |                             |                                                                       |                                 |                                                                                                                                                                                                                                                                                   |

`_POSIX_ADVISORY_INFO`  
Implementation supports the Advisory Information option.

`_POSIX_ASYNCHRONOUS_IO`  
Implementation supports the Asynchronous Input and Output option.

`_POSIX_BARRIERS`  
Implementation supports the Barriers option.

`_POSIX_CLOCK_SELECTION`  
Implementation supports the Clock Selection option.

`_POSIX_CPUTIME`  
Implementation supports the Process CPU-Time Clocks option.

`_POSIX_FSYNC`  
Implementation supports the File Synchronisation option.

`_POSIX_IPV6`  
Implementation supports the IPv6 option.

`_POSIX_JOB_CONTROL`  
Implementation supports job control.

`_POSIX_MAPPED_FILES`  
Implementation supports the Memory Mapped Files option.

`_POSIX_MEMLOCK`  
Implementation supports the Process Memory Locking option.

`_POSIX_MEMLOCK_RANGE`  
Implementation supports the Range Memory Locking option.

`_POSIX_MEMORY_PROTECTION`  
Implementation supports the Memory Protection option.

`_POSIX_MESSAGE_PASSING`  
Implementation supports the Message Passing option.

`_POSIX_MONOTONIC_CLOCK`  
Implementation supports the Monotonic Clock option.

`_POSIX_PRIORITY_SCHEDULING`  
Implementation supports the Process Scheduling option.

`_POSIX_RAW_SOCKETS`  
Implementation supports the Raw Sockets option.

`_POSIX_READER_WRITER_LOCKS`  
Implementation supports the Read-Write Locks option.

`_POSIX_REALTIME_SIGNALS`  
Implementation supports the Realtime Signals Extension option.

`_POSIX_REGEX`  
Implementation supports the Regular Expression Handling option.

## unistd.h(3HEAD)

- `_POSIX_SAVED_IDS`  
The `exec` functions (see `exec(2)`) save the effective user and group.
- `_POSIX_SEMAPHORES`  
Implementation supports the Semaphores option.
- `_POSIX_SHARED_MEMORY_OBJECTS`  
Implementation supports the Shared Memory Objects option.
- `_POSIX_SHELL`  
Implementation supports the POSIX shell.
- `_POSIX_SPAWN`  
Implementation supports the Spawn option.
- `_POSIX_SPIN_LOCKS`  
Implementation supports the Spin Locks option.
- `_POSIX_SPORADIC_SERVER`  
Implementation supports the Process Sporadic Server option.
- `_POSIX_SYNCHRONIZED_IO`  
Implementation supports the Synchronized Input and Output option.
- `_POSIX_THREAD_ATTR_STACKADDR`  
Implementation supports the thread stack address attribute option.
- `_POSIX_THREAD_ATTR_STACKSIZE`  
Implementation supports the thread stack size attribute option.
- `_POSIX_THREAD_CPUTIME`  
Implementation supports the Thread CPU-Time Clocks option.
- `_POSIX_THREAD_PROCESS_SHARED`  
Implementation supports the process-shared synchronization option.
- `_POSIX_THREAD_SAFE_FUNCTIONS`  
Implementation supports the thread-safe functions option.
- `_POSIX_THREAD_SPARADIC_SERVER`  
Implementation supports the Thread Sporadic Server option.
- `_POSIX_THREADS`  
Implementation supports the threads option.
- `_POSIX_TIMERS`  
Implementation supports the Timers option.
- `_POSIX_TIMEOUTS`  
Implementation supports the Timeouts option.
- `_POSIX_TRACE`  
Implementation supports the Trace option.
- `_POSIX_TRACE_EVENT_FILTER`  
Implementation supports the Trace Event Filter option.

`_POSIX_TRACE_INHERIT`  
Implementation supports the Trace Inherit option.

`_POSIX_TRACE_LOG`  
Implementation supports the Trace Log option.

`_POSIX_TYPED_MEMORY_OBJECTS`  
Implementation supports the Typed Memory Objects option.

`_POSIX_V6_ILP32_OFF32`  
Implementation provides a C-language compilation environment with 32-bit `int`, `long`, and `pointer` types and an `off_t` type using at least 64 bits.

`_POSIX_V6_ILP32_OFFBIG`  
Implementation provides a C-language compilation environment with 32-bit `int`, `long`, and `pointer` types and an `off_t` type using at least 64 bits.

`_POSIX_V6_LP64_OFF64`  
Implementation provides a C-language compilation environment with 32-bit `int` and 64-bit `long`, `pointer`, and `off_t` types.

`_POSIX_V6_LP64_OFFBIG`  
Implementation provides a C-language compilation environment with an `int` type using at least 32 bits and `long`, `pointer`, and `off_t` types using at least 64 bits.

`_POSIX_XOPEN_STREAMS`  
Implementation supports the XSI STREAMS Option Group.

`_POSIX2_C_BIND`  
Implementation supports the C Language Binding option.

`_POSIX2_C_DEV`  
Implementation supports the C Language Development Utilities option.

`_POSIX2_CHAR_TERM`  
Implementation supports at least one terminal type.

`_POSIX2_LOCALEDEF`  
Implementation supports the creation of locales by the `localedef(1)` utility.

`_POSIX2_PBS`  
Implementation supports the Batch Environment Services and Utilities option.

`_POSIX2_PBS_ACCOUNTING`  
Implementation supports the Batch Accounting option.

`_POSIX2_PBS_CHECKPOINT`  
Implementation supports the Batch Checkpoint/Restart option.

`_POSIX2_PBS_LOCATE`  
Implementation supports the Locate Batch Job Request option.

`_POSIX2_PBS_MESSAGE`  
Implementation supports the Batch Job Message Request option.

`_POSIX2_PBS_TRACK`  
Implementation supports the Track Batch Job Request option.

## unistd.h(3HEAD)

- `_POSIX2_SW_DEV`  
Implementation supports the Software Development Utilities option.
- `_POSIX2_UPE`  
Implementation supports the User Portability Utilities option.
- `_XBS5_ILP32_OFF32`  
Implementation provides a C-language compilation environment with 32-bit `int`, `long`, `pointer` and `off_t` types.
- `_XBS5_ILP32_OFFBIG`  
Implementation provides a C-language compilation environment with 32-bit `int`, `long` and `pointer` types and an `off_t` type using at least 64 bits.
- `_XBS5_LP64_OFF64`  
Implementation provides a C-language compilation environment with 32-bit `int` and 64-bit `long`, `pointer` and `off_t` types.
- `_XBS5_LPBIG_OFFBIG`  
Implementation provides a C-language compilation environment with an `int` type using at least 32 bits and `long`, `pointer` and `off_t` types using at least 64 bits.
- `_XOPEN_ENH_I18N`  
Implementation supports the Issue 4, Version 2 Enhanced Internationalization Feature Group.
- `_XOPEN_LEGACY`  
Implementation supports the Legacy Feature Group.
- `_XOPEN_REALTIME`  
Implementation supports the X/Open Realtime Feature Group.
- `_XOPEN_SHM`  
Implementation supports the Issue 4, Version 2 Shared Memory Feature Group.
- `_XOPEN_UNIX`  
X/Open CAE Specification, January 1997, System Interfaces and Headers, Issue 5 (ISBN: 1-85912-181-0, C606).
- `_XOPEN_XPG3`  
X/Open Specification, February 1992, System Interfaces and Headers, Issue 3 (ISBN: 1-872630-37-5, C212); this specification was formerly X/Open Portability Guide, Issue 3, Volume 2, January 1989, XSI System Interface and Headers (ISBN: 0-13-685843-0, XO/XPG/89/003).
- `_XOPEN_XPG4`  
X/Open CAE Specification, July 1992, System Interfaces and Headers, Issue 4 (ISBN: 1-872630-47-2, C202).

### Execution-time Symbolic Constants

If any of the following constants are not defined in the header `<unistd.h>`, the value varies depending on the file to which it is applied.

If any of the following constants are defined to have value `-1` in the header `<unistd.h>`, the implementation will not provide the option on any file; if any are defined to have a value other than `-1` in the header `<unistd.h>`, the implementation will provide the option on all applicable files.

All of the following constants, whether defined in `<unistd.h>` or not, can be queried with respect to a specific file using the `pathconf()` or `fpathconf()` functions.

|                              |                                                                                   |
|------------------------------|-----------------------------------------------------------------------------------|
| <code>_POSIX_ASYNC_IO</code> | Asynchronous input or output operations can be performed for the associated file. |
| <code>_POSIX_PRIO_IO</code>  | Prioritized input or output operations can be performed for the associated file.  |
| <code>_POSIX_SYNC_IO</code>  | Synchronized input or output operations can be performed for the associated file. |

### Constants for Functions

The following constant is defined:

`NULL` Null pointer.

The following symbolic constants are defined for the `access(2)` function:

|                   |                                       |
|-------------------|---------------------------------------|
| <code>R_OK</code> | Test for read permission.             |
| <code>W_OK</code> | Test for write permission.            |
| <code>X_OK</code> | Test for execute (search) permission. |
| <code>F_OK</code> | Test for existence of file.           |

The constants `F_OK`, `R_OK`, `W_OK`, and `X_OK`, and the expressions `R_OK | W_OK`, `R_OK | X_OK`, and `R_OK | W_OK | X_OK` all have distinct values.

The following symbolic constants are defined for the `lockf(3C)` function:

|                      |                                           |
|----------------------|-------------------------------------------|
| <code>F_ULOCK</code> | Unlock a previously locked region.        |
| <code>F_LOCK</code>  | Lock a region for exclusive use.          |
| <code>F_TLOCK</code> | Test and lock a region for exclusive use. |
| <code>F_TEST</code>  | Test a region for other processes locks.  |

The following symbolic constants are defined for the `lseek(2)` and `fcntl(2)` functions (they have distinct values):

|                       |                                                 |
|-----------------------|-------------------------------------------------|
| <code>SEEK_SET</code> | Set file offset to <i>offset</i> .              |
| <code>SEEK_CUR</code> | Set file offset to current plus <i>offset</i> . |
| <code>SEEK_END</code> | Set file offset to EOF plus <i>offset</i> .     |

The following symbolic constants are defined for the `confstr(3C)` function for both SPARC and x86:

## unistd.h(3HEAD)

|                                                  |                                                |
|--------------------------------------------------|------------------------------------------------|
| <code>_CS_LFS64_CFLAGS</code>                    | <code>_CS_LFS64_LDFLAGS</code>                 |
| <code>_CS_LFS64_LIBS</code>                      | <code>_CS_LFS64_LINTFLAGS</code>               |
| <code>_CS_LFS_CFLAGS</code>                      | <code>_CS_LFS_LDFLAGS</code>                   |
| <code>_CS_LFS_LIBS</code>                        | <code>_CS_LFS_LINTFLAGS</code>                 |
| <code>_CS_PATH</code>                            | <code>_CS_POSIX_V6_ILP32_OFF32_CFLAGS</code>   |
| <code>_CS_POSIX_V6_ILP32_OFF32_LDFLAGS</code>    | <code>_CS_POSIX_V6_ILP32_OFF32_LIBS</code>     |
| <code>_CS_POSIX_V6_ILP32_OFF32_LINTFLAGS</code>  | <code>_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS</code>  |
| <code>_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS</code>   | <code>_CS_POSIX_V6_ILP32_OFFBIG_LIBS</code>    |
| <code>_CS_POSIX_V6_ILP32_OFFBIG_LINTFLAGS</code> | <code>_CS_POSIX_V6_WIDTH_RESTRICTED_ENV</code> |
| <code>_CS_XBS5_ILP32_OFF32_CFLAGS</code>         | <code>_CS_XBS5_ILP32_OFF32_LDFLAGS</code>      |
| <code>_CS_XBS5_ILP32_OFF32_LIBS</code>           | <code>_CS_XBS5_ILP32_OFF32_LINTFLAGS</code>    |
| <code>_CS_XBS5_ILP32_OFFBIG_CFLAGS</code>        | <code>_CS_XBS5_ILP32_OFFBIG_LDFLAGS</code>     |
| <code>_CS_XBS5_ILP32_OFFBIG_LIBS</code>          | <code>_CS_XBS5_ILP32_OFFBIG_LINTFLAGS</code>   |

The following symbolic constants are defined for the `confstr()` function for SPARC only:

|                                               |                                                  |
|-----------------------------------------------|--------------------------------------------------|
| <code>_CS_POSIX_V6_LP64_OFF64_CFLAGS</code>   | <code>_CS_POSIX_V6_LP64_OFF64_LDFLAGS</code>     |
| <code>_CS_POSIX_V6_LP64_OFF64_LIBS</code>     | <code>_CS_POSIX_V6_LP64_OFF64_LINTFLAGS</code>   |
| <code>_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS</code> | <code>_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS</code>   |
| <code>_CS_POSIX_V6_LPBIG_OFFBIG_LIBS</code>   | <code>_CS_POSIX_V6_LPBIG_OFFBIG_LINTFLAGS</code> |
| <code>_CS_XBS5_LP64_OFF64_CFLAGS</code>       | <code>_CS_XBS5_LP64_OFF64_LDFLAGS</code>         |
| <code>_CS_XBS5_LP64_OFF64_LIBS</code>         | <code>_CS_XBS5_LP64_OFF64_LINTFLAGS</code>       |
| <code>_CS_XBS5_LPBIG_OFFBIG_CFLAGS</code>     | <code>_CS_XBS5_LPBIG_OFFBIG_LDFLAGS</code>       |
| <code>_CS_XBS5_LPBIG_OFFBIG_LIBS</code>       | <code>_CS_XBS5_LPBIG_OFFBIG_LINTFLAGS</code>     |

The following symbolic constants are defined for the `sysconf(3C)` function:

|                              |                              |
|------------------------------|------------------------------|
| <code>_SC_2_C_BIND</code>    | <code>_SC_2_C_DEV</code>     |
| <code>_SC_2_C_VERSION</code> | <code>_SC_2_FORT_DEV</code>  |
| <code>_SC_2_FORT_RUN</code>  | <code>_SC_2_LOCALEDEF</code> |

|                         |                      |
|-------------------------|----------------------|
| _SC_2_PBS               | _SC_2_PBS_ACCOUNTING |
| _SC_2_PBS_CHECKPOINT    | _SC_2_PBS_LOCATE     |

`_SC_XOPEN_XCU_VERSION`

The constants `_SC_PAGESIZE` and `_SC_PAGE_SIZE` can be defined to have the same value.

The following symbolic constants are defined for the `fpathconf(2)` function:

|                                    |                                     |
|------------------------------------|-------------------------------------|
| <code>_PC_2_SYMLINKS</code>        | <code>_PC_ALLOC_SIZE_MIN</code>     |
| <code>_PC_ASYNC_IO</code>          | <code>_PC_CHOWN_RESTRICTED</code>   |
| <code>_PC_FILESIZEBITS</code>      | <code>_PC_LINK_MAX</code>           |
| <code>_PC_MAX_CANON</code>         | <code>_PC_MAX_INPUT</code>          |
| <code>_PC_NAME_MAX</code>          | <code>_PC_NO_TRUNC</code>           |
| <code>_PC_PATH_MAX</code>          | <code>_PC_PIPE_BUF</code>           |
| <code>_PC_PRIO_IO</code>           | <code>_PC_REC_INCR_XFER_SIZE</code> |
| <code>_PC_REC_MAX_XFER_SIZE</code> | <code>_PC_REC_MIN_XFER_SIZE</code>  |
| <code>_PC_REC_XFER_ALIGN</code>    | <code>_PC_SYMLINK_MAX</code>        |
| <code>_PC_SYNC_IO</code>           | <code>_PC_VDISABLE</code>           |
| <code>_PC_XATTR_ENABLED</code>     | <code>_PC_XATTR_EXISTS</code>       |

The following symbolic constants are defined for file streams:

|                            |                                          |
|----------------------------|------------------------------------------|
| <code>STDIN_FILENO</code>  | File number (0) of <code>stdin</code> .  |
| <code>STDOUT_FILENO</code> | File number (1) of <code>stdout</code> . |
| <code>STDERR_FILENO</code> | File number (2) of <code>stderr</code> . |

The following pathnames are defined:

|                      |                              |
|----------------------|------------------------------|
| <code>GF_PATH</code> | Pathname of the group file.  |
| <code>PF_PATH</code> | Pathname of the passwd file. |

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

| <b>DESCRIPTION</b>  | <p>The <code>&lt;utmpx.h&gt;</code> header defines the <code>utmpx</code> structure, which includes the following members:</p> <pre>char          ut_user[]    /* user login name */ char          ut_id[]     /* unspecified initialization process identifier */ char          ut_line[]   /* device name */ pid_t        ut_pid      /* process ID */ short        ut_type     /* type of entry */ struct timeval ut_tv     /* time entry was made */</pre> <p>The <code>pid_t</code> type is defined through <code>typedef</code> as described in <code>&lt;sys/types.h&gt;</code>.</p> <p>The <code>timeval</code> structure is defined as described in <code>&lt;sys/time.h&gt;</code>.</p> <p>Inclusion of the <code>&lt;utmpx.h&gt;</code> header can also make visible all symbols from <code>&lt;sys/time.h&gt;</code>.</p> <p>The following symbolic constants are defined as possible values for the <code>ut_type</code> member of the <code>utmpx</code> structure:</p> <pre>EMPTY          No valid user accounting information. BOOT_TIME      Identifies time of system boot. OLD_TIME       Identifies time when system clock changed. NEW_TIME       Identifies time after system clock changed. USER_PROCESS   Identifies a process. INIT_PROCESS   Identifies a process spawned by the <code>init</code> process. LOGIN_PROCESS  Identifies the session leader of a logged-in user. DEAD_PROCESS   Identifies a session leader who has exited.</pre> <p><b>ATTRIBUTES</b> See <code>attributes(5)</code> for descriptions of the following attributes:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">ATTRIBUTE TYPE</th> <th style="text-align: center;">ATTRIBUTE VALUE</th> </tr> </thead> <tbody> <tr> <td>Interface Stability</td> <td>Standard</td> </tr> </tbody> </table> | ATTRIBUTE TYPE | ATTRIBUTE VALUE | Interface Stability | Standard |

## utsname.h(3HEAD)

**NAME** | `utsname.h`, `utsname` – system name structure

**SYNOPSIS** | `#include <sys/utsname.h>`

**DESCRIPTION** | The `<sys/utsname.h>` header defines the structure `utsname`, which includes the following members:

```
char sysname[]      /* name of this implementation of the operating */
                   /* system */
char nodename[]    /* name of this node within an implementation- */
                   /* defined communications network */
char release[]     /* current release level of this implementation */
char version[]     /* current version level of this release */
char machine[]     /* name of the hardware type on which the system is */
                   /* running */
```

The character arrays are of unspecified size, but the data stored in them is terminated by a null byte.

**ATTRIBUTES** | See `attributes(5)` for descriptions of the following attributes:

| <b>NAME</b>        | wait.h, wait – wait status                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>SYNOPSIS</b>    | #include <sys/wait.h>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DESCRIPTION</b> | <p>When a process waits for status from its children using either the <code>wait(3C)</code> or <code>waitpid(3C)</code> function, the status returned can be evaluated with the following macros, defined in <code>&lt;sys/wait.h&gt;</code>. These macros evaluate to integral expressions. The <code>stat</code> argument to these macros is the integer value returned from <code>wait()</code> or <code>waitpid()</code>.</p> <p><code>WCOREDUMP(stat)</code> If the value of <code>WIFSIGNALED(stat)</code> is non-zero, this macro evaluates to a non-zero value if a core image of the terminated child was created.</p> <p><code>WEXITSTATUS(stat)</code> If the value of <code>WIFEXITED(stat)</code> is non-zero, this macro evaluates to the exit code that the child process passed to <code>_exit()</code> (see <code>exit(2)</code>) or <code>exit(3C)</code>, or the value that the child process returned from <code>main</code>.</p> <p><code>WIFCONTINUED(stat)</code> Evaluates to a non-zero value if status was returned for a child process that has continued.</p> <p><code>WIFEXITED(stat)</code> Evaluates to a non-zero value if status was returned for a child process that terminated normally.</p> <p><code>WIFSIGNALED(stat)</code> Evaluates to a non-zero value if status was returned for a child process that terminated due to the receipt of a signal.</p> <p><code>WIFSTOPPED(stat)</code> Evaluates to a non-zero value if status was returned for a child process that is currently stopped.</p> <p><code>WSTOPSIG(stat)</code> If the value of <code>WIFSTOPPED(stat)</code> is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.</p> <p><code>WTERMSIG(stat)</code> If the value of <code>WIFSIGNALED(stat)</code> is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.</p> <p>The <code>&lt;sys/wait.h&gt;</code> header defines the symbolic constants listed below for use with <code>waitpid(3C)</code>.</p> <p><code>WNOHANG</code> Do not hang if no status is available; return immediately.</p> |

wait.h(3HEAD)

WUNTRACED Report status of stopped child process.

The symbolic constants listed below are defined as possible values for the *options* argument to `waitid(2)`.

WEXITED Wait for processes that have exited.

WSTOPPED Status is returned for any child that has stopped upon receipt of a signal.

WCONTINUED Status is returned for any child that was stopped and has been continued.

WNOHANG Return immediately if there are no children to wait for.

WNOWAIT Keep the process whose status is returned in `info` in a waitable state.

The type `idtype_t` is defined as an enumeration type whose possible values include the following:

P\_ALL  
P\_PID  
P\_PGID

The `id_t` and `pid_t` types are defined as described in `<sys/types.h>`.

The `siginfo_t` type is defined as described in `<signal.h>`.

The `rusage` structure is defined as described in `<sys/resource.h>`.

Inclusion of the `<sys/wait.h>` header can also make visible all symbols from `<signal.h>` and `<sys/resource.h>`.

**ATTRIBUTES** See `attributes(5)` for descriptions of the following attributes:

| ATTRIBUTE TYPE      | ATTRIBUTE VALUE |
|---------------------|-----------------|
| Interface Stability | Standard        |

| <b>NAME</b>        | wchar.h, wchar – wide-character handling                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>SYNOPSIS</b>    | #include <wchar.h>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>DESCRIPTION</b> | <p>The &lt;wchar.h&gt; header defines the following types:</p> <p>wchar_t           As described in &lt;stddef.h&gt;.</p> <p>wint_t            An integer type capable of storing any valid value of wchar_t or WEOF.</p> <p>wctype_t          A scalar type of a data object that can hold values which represent locale-specific character classification.</p> <p>mbstate_t         An object type other than an array type that can hold the conversion state information necessary to convert between sequences of (possibly multi-byte) characters and wide characters. If a codeset is being used such that an mbstate_t needs to preserve more than two levels of reserved state, the results are unspecified.</p> <p>FILE              As described in &lt;stdio.h&gt;.</p> <p>size_t            As described in &lt;stddef.h&gt;.</p> <p>va_list           As described in &lt;stdarg.h&gt;.</p> <p>The implementation supports one or more programming environments in which the width of wint_t is no greater than the width of type long. The names of these programming environments can be obtained using the confstr(3C) function or the getconf(1) utility.</p> <p>The &lt;wchar.h&gt; header defines the following macros:</p> <p>WCHAR_MAX         The maximum value representable by an object of type wchar_t.</p> <p>WCHAR_MIN         The minimum value representable by an object of type wchar_t.</p> <p>WEOF              Constant expression of type wint_t that is returned by several WP functions to indicate end-of-file.</p> <p>NULL              As described in &lt;stddef.h&gt;.</p> <p>The tag tm is declared as naming an incomplete structure type, the contents of which are described in the header &lt;time.h&gt;.</p> <p>Inclusion of the &lt;wchar.h&gt; header can make visible all symbols from the headers &lt;ctype.h&gt;, &lt;string.h&gt;, &lt;stdarg.h&gt;, &lt;stddef.h&gt;, &lt;stdio.h&gt;, &lt;stdlib.h&gt;, and &lt;time.h&gt;.</p> |

| <b>SYNOPSIS</b>     | #include <wctype.h>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                |                 |                     |          |
| <b>DESCRIPTION</b>  | <p>The &lt;wctype.h&gt; header defines the following types:</p> <p>wint_t           As described in &lt;wchar.h&gt;.</p> <p>wctrans_t        A scalar type that can hold values that represent locale-specific character mappings.</p> <p>wctype_t         As described in &lt;wchar.h&gt;.</p> <p>The &lt;wctype.h&gt; header defines the following macro name:</p> <p>WEOF             Constant expression of type wint_t that is returned by several MSE functions to indicate end-of-file.</p> <p>For all functions described in this header that accept an argument of type wint_t, the value is representable as a wchar_t or equals the value of WEOF. If this argument has any other value, the behavior is undefined.</p> <p>The behavior of these functions is affected by the LC_CTYPE category of the current locale.</p> <p>Inclusion of the &lt;wctype.h&gt; header can make visible all symbols from the headers &lt;ctype.h&gt;, &lt;stdarg.h&gt;, &lt;stddef.h&gt;, &lt;stdio.h&gt;, &lt;stdlib.h&gt;, &lt;string.h&gt;, &lt;time.h&gt;, and &lt;wchar.h&gt;.</p> |                |                 |                     |          |

| <b>SYNOPSIS</b>           | #include <wordexp.h>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                          |                                             |                          |                                                               |                         |                                            |                         |                                                                                                                                                                                                                                                                                                                       |                           |                                                                 |                         |                                                                   |                           |                                                                                                                                                                                                                                                                          |                          |                                                                                             |                          |                                                                                       |                           |                                    |                         |           |                          |                                                                            |
| <b>DESCRIPTION</b>        | <p>The &lt;wordexp.h&gt; header defines the structures and symbolic constants used by the <code>wordexp()</code> and <code>wordfree()</code> functions. See <code>wordexp(3C)</code>.</p> <p>The structure type <code>wordexp_t</code> contains the following members:</p> <pre>size_t we_wordc      /* count of words matched by words */ char  **we_wordv    /* pointer to list of expanded words */ size_t we_offs      /* slots to reserve at the beginning of we_wordv</pre> <p>The <i>flags</i> argument to the <code>wordexp()</code> function is the bitwise-inclusive OR of the following flags:</p> <table><tr><td><code>WRDE_APPEND</code></td><td>Append words to those previously generated.</td></tr><tr><td><code>WRDE_DOOFFS</code></td><td>Number of null pointers to prepend to <code>we_wordv</code>.</td></tr><tr><td><code>WRDE_NOCMD</code></td><td>Fail if command substitution is requested.</td></tr><tr><td><code>WRDE_REUSE</code></td><td>The <code>pwordexp</code> argument was passed to a previous successful call to <code>wordexp()</code>, and has not been passed to <code>wordfree()</code>. The result is the same as if the application had called <code>wordfree()</code> and then called <code>wordexp()</code> without <code>WRDE_REUSE</code>.</td></tr><tr><td><code>WRDE_SHOWERR</code></td><td>Do not redirect <code>stderr</code> to <code>/dev/null</code>.</td></tr><tr><td><code>WRDE_UNDEF</code></td><td>Report error on an attempt to expand an undefined shell variable.</td></tr></table> <p>The following constants are defined as error return values:</p> <table><tr><td><code>WRDE_BADCHAR</code></td><td>One of the unquoted characters—&lt;newline&gt;, <code>' '</code>, <code>'&amp;'</code>, <code>';</code>, <code>'&lt;'</code>, <code>'&gt;'</code>, <code>'(</code>, <code>)'</code>, <code>'{'</code>, <code>'}'</code>—appears in words in an inappropriate context.</td></tr><tr><td><code>WRDE_BADVAL</code></td><td>Reference to undefined shell variable when <code>WRDE_UNDEF</code> is set in <i>flags</i>.</td></tr><tr><td><code>WRDE_CMDSUB</code></td><td>Command substitution requested when <code>WRDE_NOCMD</code> was set in <i>flags</i>.</td></tr><tr><td><code>WRDE_NOSPACE</code></td><td>Attempt to allocate memory failed.</td></tr><tr><td><code>WRDE_NOSYS</code></td><td>Reserved.</td></tr><tr><td><code>WRDE_SYNTAX</code></td><td>Shell syntax error, such as unbalanced parentheses or unterminated string.</td></tr></table> <p>The &lt;wordexp.h&gt; header defines the following type:</p> <pre>size_t      As described in &lt;stddef.h&gt;.</pre> | <code>WRDE_APPEND</code> | Append words to those previously generated. | <code>WRDE_DOOFFS</code> | Number of null pointers to prepend to <code>we_wordv</code> . | <code>WRDE_NOCMD</code> | Fail if command substitution is requested. | <code>WRDE_REUSE</code> | The <code>pwordexp</code> argument was passed to a previous successful call to <code>wordexp()</code> , and has not been passed to <code>wordfree()</code> . The result is the same as if the application had called <code>wordfree()</code> and then called <code>wordexp()</code> without <code>WRDE_REUSE</code> . | <code>WRDE_SHOWERR</code> | Do not redirect <code>stderr</code> to <code>/dev/null</code> . | <code>WRDE_UNDEF</code> | Report error on an attempt to expand an undefined shell variable. | <code>WRDE_BADCHAR</code> | One of the unquoted characters—<newline>, <code>' '</code> , <code>'&amp;'</code> , <code>';</code> , <code>'&lt;'</code> , <code>'&gt;'</code> , <code>'(</code> , <code>)'</code> , <code>'{'</code> , <code>'}'</code> —appears in words in an inappropriate context. | <code>WRDE_BADVAL</code> | Reference to undefined shell variable when <code>WRDE_UNDEF</code> is set in <i>flags</i> . | <code>WRDE_CMDSUB</code> | Command substitution requested when <code>WRDE_NOCMD</code> was set in <i>flags</i> . | <code>WRDE_NOSPACE</code> | Attempt to allocate memory failed. | <code>WRDE_NOSYS</code> | Reserved. | <code>WRDE_SYNTAX</code> | Shell syntax error, such as unbalanced parentheses or unterminated string. |
| <code>WRDE_APPEND</code>  | Append words to those previously generated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                          |                                             |                          |                                                               |                         |                                            |                         |                                                                                                                                                                                                                                                                                                                       |                           |                                                                 |                         |                                                                   |                           |                                                                                                                                                                                                                                                                          |                          |                                                                                             |                          |                                                                                       |                           |                                    |                         |           |                          |                                                                            |

accounting files, — `acct`, 30  
`acct` — process accounting file format, 30  
additional definitions for date and time —  
  `timeb.h`, 432  
additional definitions for date and time —  
  `timeb`, 432  
alternative spellings — `iso646.h`, 69  
alternative spellings — `iso646`, 69  
alternative memory allocator library —  
  `libmapmalloc`, 184  
`ar` — archive file format, 33  
archive file format — `ar`, 33  
`assert` — verify program assertion, 36  
`assert.h` — verify program assertion, 36  
asynchronous I/O library — `libaio`, 75

## B

basic security library — `libbssm`, 78  
boolean type and values — `stdbool.h`, 398  
boolean type and values — `stdbool`, 398

## C

C library — `libc`, 80  
C math library — `libm`, 166

category macros — `locale.h`, 349  
category macros — `locale`, 349  
codeset conversion facility — `iconv.h`, 61  
codeset conversion facility — `iconv`, 61  
Common Fibre Channel HBA information  
  library — `libhbaapi`, 154  
complex — complex arithmetic, 37  
complex arithmetic — `complex.h`, 37  
complex arithmetic — `complex`, 37  
`complex.h` — complex arithmetic, 37  
configuration adminstartion library —  
  `libcfgadm`, 112  
contract management library — `libcontract`, 113  
`cpio` — cpio archive values, 39  
cpio archive values — `cpio.h`, 39  
cpio archive values — `cpio`, 39  
`cpio.h` — cpio archive values, 39

## D

define values for `termios` — `termios.h`, 423  
define values for `termios` — `termios`, 423  
definitions for internet operations — `inet`, 63  
definitions for `ndbm` database operations —  
  `ndbm`, 359  
definitions for network database operations —  
  `netdb`, 360  
definitions for pattern matching functions —  
  `libgen.h`, 151  
definitions for pattern matching functions —  
  `libgen`, 151

- definitions for resource operations — resource.h, 369
- definitions for resource operations — resource, 369
- definitions for system error logging — syslog.h, 418
- definitions for system error logging — syslog, 418
- definitions for the `poll()` function — poll.h, 363
- definitions for the `poll()` function — poll, 363
- definitions for the Internet Transmission Control Protocol (TCP) — tcp.h, 422
- definitions for the Internet Transmission Control Protocol (TCP) — tcp, 422
- definitions for UNIX-domain sockets — un, 443
- definitions for vector I/O operations — uio.h, 441
- definitions for vector I/O operations — uio, 441
- device ID library — libdevid, 131
- layout service library — liblayout, 164
- name—value pair library — libnvpair, 257
- device information library — libdevinfo, 132
- `dirent` — format of directory entries, 41
- `dirent.h` — format of directory entries, 41
- doors library — libdoor, 140
- DTrace dynamic tracing software library — libdtrace, 141
- dynamic linking library — libdl, 136

## E

- ELF access library — libelf, 143
- encryption/decryption library — libcrypt, 117
- `errno` — system error numbers, 42
- `errno.h` — system error numbers, 42
- extended tar definitions — tar.h, 420
- extended tar definitions — tar, 420

## F

- `fenv` — floating-point environment, 47
- `fenv.h` — floating-point environment, 47
- file access and modification times structure — times.h, 435

- file access and modification times structure — times, 435
- file tree traversal — ftw.h, 58
- file tree traversal — ftw, 58
- File Access Control List library — libsec, 300
- file control options, — `fcntl`, 43
- filename-matching types — `fnmatch.h`, 57
- filename-matching types — `fnmatch`, 57
- fixed size integer types — `inttypes.h`, 66
- fixed size integer types — `inttypes`, 66
- fixed-width data types — `types32`, 436
- `float` — floating types, 50
- `float.h` — floating types, 50
- floating types — `float.h`, 50
- floating types — `float`, 50
- floating-point environment — `fenv.h`, 47
- floating-point environment — `fenv`, 47
- floatingpoint — IEEE floating point definitions, 53
- `fmtmsg` — message display structures, 55
- `fmtmsg.h` — message display structures, 55
- `fnmatch` — filename-matching types, 57
- `fnmatch.h` — filename-matching types, 57
- format of directory entries — `dirent.h`, 41
- format of directory entries — `dirent`, 41
- forms library — libform, 147
- `ftw` — file tree traversal, 58
- `ftw.h` — file tree traversal, 58

## G

- general administrative library — libadm, 74
- Generic Security Services library — libgss, 152
- `glob` — pathname pattern-matching types, 59
- `glob.h` — pathname pattern-matching types, 59
- graphics interface libraries
  - `lib300`, 269
  - `lib300s`, 269
  - `lib4014`, 269
  - `lib450`, 269
  - `libplot`, 269
  - `libvt0`, 269
- group structure — `grp.h`, 60
- group structure — `grp`, 60
- `grp` — group structure, 60
- `grp.h` — group structure, 60

## I

iconv — codeset conversion facility, 61  
iconv.h — codeset conversion facility, 61  
IEEE arithmetic, floating point definitions —  
floatingpoint, 53  
if — sockets local interfaces, 62  
if.h — sockets local interfaces, 62  
implementation-defined constants —  
limits.h, 339  
implementation-defined constants —  
limits, 339  
in — Internet Protocol family, 64  
inet — definitions for internet operations, 63  
Default, 63  
Standard-conforming, 63  
integer types — stdint.h, 400  
integer types — stdint, 400  
interactive command line input library —  
libtecla, 316  
internationalization library — libintl, 160  
Internet Protocol family — in, 64  
Internet Protocol family — socket, 390  
inttypes — fixed size integer types, 66  
inttypes.h — fixed size integer types, 66  
ipc — XSI interprocess communication access  
structure, 68  
ipc.h — XSI interprocess communication access  
structure, 68  
iso646 — alternative spellings, 69  
iso646.h — alternative spellings, 69

## K

kernel statistics library — libkstat, 161  
Kernel Virtual Memory access library —  
libkvm, 162

## L

langinfo — language information constants, 70  
language data types, native — nl\_types, 362  
language information constants — langinfo, 70  
lex library — libl, 163  
lib300 — graphics interface libraries, 269  
lib300s — graphics interface libraries, 269  
lib4014 — graphics interface libraries, 269

lib450 — graphics interface libraries, 269  
libadm — general administrative library, 74  
libaio — asynchronous I/O library, 75  
libbsdmalloc — memory allocator interface  
library, 77  
libbsm — basic security library, 78  
libc — C library, 80  
libc — the C library, 80  
libcfgadm — configuration adminstartion  
library, 112  
libcontract — contract management library, 113  
libcrypt — encryption/decryption library, 117  
libcurses — screen handling and optimization  
library, 118  
libdevicid — device ID library, 131  
liblayout — layout service library, 164  
libnvpair — name—value pair library, 257  
libdevinfo — device information library, 132  
libdl — dynamic linking library, 136  
libdmi — Sun Solstice Enterprise Agent DMI  
library, 137  
libdmici — Sun Solstice Enterprise Agent  
Component library, 138  
libdmimi — Sun Solstice Enterprise Agent  
Management library, 139  
libdoor — doors library, 140  
libdtrace — DTrace dynamic tracing software  
library, 141  
libelf — ELF access library, 143  
libform — forms library, 147  
libgen — definitions for pattern matching  
functions, 151  
libgen — string pattern-matching library, 149  
libgen.h — definitions for pattern matching  
functions, 151  
libgss — Generic Security Services library, 152  
libhbaapi — Common Fibre Channel HBA  
information library, 154  
libintl — internationalization library, 160  
libkstat — kernel statistics library, 161  
libkvm — Kernel Virtual Memory access  
library, 162  
/usr/lib/libkvm.so.1, 162  
libl — lex library, 163  
libm — C math library, 166  
libmail — user mailbox lockfile management  
library, 182  
libmalloc — memory allocation library, 183

libmapmalloc — alternative memory allocator library, 184

libmenu — menus library, 186

libmllib — mediaLib library, 188

libmp — multiple precision library, 245

libmtmalloc — multi-threaded memory allocator library, 246

libmvec — vector math library, 247

libnls — network listener service library, 248

libnsl — network services library, 249

libpam — PAM (Pluggable Authentication Module) library, 260

libpanel — panels library, 262

libpicl — PICL library, 264

libpicltree — PICL plug-in library, 265

libpkcs11 — PKCS#11 Cryptographic Framework library, 266

libplot — graphics interface libraries, 269

libpool — pool configuration manipulation library, 271

libposix4 — POSIX.1b Realtime Extensions library, 290

libpthread — POSIX threads library, 280

libpthread — posix threads library, /usr/lib/libpthread.so.1, 280

librac — remote asynchronous calls library, 283

library file format — ar, 33

libresolv — resolver library, 284

librpcsoc — obsolete RPC library, 286

librpcsvc — RPC services library, 287

librsm — remote shared memory interface library, 288

librt — POSIX.1b Realtime Extensions library, 290

librtld\_db — runtime linker debugging library, 292

libscf — service configuration facility library, 295

libsec — File Access Control List library, 300 /usr/lib/libsec.so.1, 300

libsecdb — security attributes database library, 301

libsendfile — sendfile library, 303

libslp — service location protocol library, 304

libsmartcard — smartcard library, 305

libsocket — sockets library, 306

libssagent — Sun Solstice Enterprise Agent library, 308

libssasmp — Sun Solstice Enterprise SNMP library, 309

libsys — system library, 310

libtecla — interactive command line input library, 316

libtermcap — screen handling and optimization library, 118

libtermplib — screen handling and optimization library, 118

libthread — threads library, 320

libtnftcl — TNF probe control library, 322

libucb — UCB source compatibility library, 324

libvolmgt — volume management library, 330

libvt0 — graphics interface libraries, 269

libw — wide character library, 331

libwsreg — product install registry library, 333

libxnet — X/Open Networking library, 335

liby — yacc library, 338

limits — implementation-defined constants, 339

limits.h — implementation-defined constants, 339

locale — category macros, 349

locale.h — category macros, 349

## M

machine-dependent values, — values, 457

math — mathematical declarations, 351

math.h — mathematical declarations, 351

mathematical declarations — math.h, 351

mathematical declarations — math, 351

mediaLib library — libmllib, 188

memory management declarations — mman.h, 354

memory management declarations — mman, 354

memory allocation library — libmalloc, 183

memory allocator interface library — libbsdmalloc, 77

menus library — libmenu, 186

message display structures — fmtmsg.h, 55

message display structures — fmtmsg, 55

message queue structures — msg.h, 358

message queue structures — msg, 358

mman — memory management declarations, 354

mman.h — memory management  
  declarations, 354  
monetary — monetary types, 356  
monetary types — monetary.h, 356  
monetary types — monetary, 356  
monetary.h — monetary types, 356  
msg — message queue structures, 358  
msg.h — message queue structures, 358  
multi-threaded memory allocator library —  
  libmtmalloc, 246  
multiple precision library — libmp, 245

## N

ndbm — definitions for ndbm database  
  operations, 359  
netdb — definitions for network database  
  operations, 360  
network listener service library — libnls, 248  
network services library — libnsl, 249  
nl\_types — native language data types, 362

## O

obsolete RPC library — librpcsoc, 286

## P

PAM (Pluggable Authentication Module) library  
  — libpam, 260  
panels library — libpanel, 262  
password structure — pwd.h, 366  
password structure — pwd, 366  
pathname pattern-matching types — glob.h, 59  
pathname pattern-matching types — glob, 59  
PICL library — libpicl, 264  
PICL plug-in library — libpicltree, 265  
PKCS#11 Cryptographic Framework library —  
  libpkcs11, 266  
poll — definitions for the poll() function, 363  
poll.h — definitions for the poll()  
  function, 363  
pool configuration manipulation library —  
  libpool, 271

POSIX.1b Realtime Extensions library —  
  libposix4, 290  
POSIX.1b Realtime Extensions library —  
  librt, 290  
POSIX threads library — libpthread, 280  
primitive system data types — types.h, 437  
primitive system data types — types, 437  
process accounting, — acct, 30  
processes  
  base signals — signal, 383  
  signal generation information — siginfo, 379  
product install registry library — libwsreg, 333  
pthread — threads, 364  
pthread.h — threads, 364  
pwd — password structure, 366  
pwd.h — password structure, 366

## R

regex — regular expression matching  
  types, 367  
regex.h — regular expression matching  
  types, 367  
regular expression matching types —  
  regex.h, 367  
regular expression matching types —  
  regex, 367  
remote asynchronous calls library — librac, 283  
remote shared memory interface library —  
  librsm, 288  
resolver library — libresolv, 284  
resource — definitions for resource  
  operations, 369  
resource.h — definitions for resource  
  operations, 369  
RPC services library — librpcsvc, 287  
runtime linker debugging library —  
  librtld\_db, 292

## S

screen handling and optimization library  
  — libcurses, 118  
  — libtermcap, 118  
  — libtermlib, 118  
search — search tables, 372

search tables — search.h, 372  
 search tables — search, 372  
 search.h — search tables, 372  
 security attributes database library —  
   libsecdb, 301  
 select — select types, 373  
 select types — select.h, 373  
 select types — select, 373  
 select.h — select types, 373  
 sem — semaphore facility, 375  
 sem.h — semaphore facility, 375  
 semaphore — semaphores, 374  
 semaphore.h — semaphores, 374  
 semaphores — semaphore.h, 374  
 semaphores — semaphore, 374  
 sendfile library — libsendfile, 303  
 service configuration facility library —  
   libscf, 295  
 service location protocol library — libslp, 304  
 setjmp — stack environment declarations, 377  
 setjmp.h — stack environment  
   declarations, 377  
 shared memory facility — shm.h, 378  
 shared memory facility — shm, 378  
 shm — shared memory facility, 378  
 shm.h — shared memory facility, 378  
 signal — base signals, 383  
 signal generation information, — siginfo, 379  
 smartcard library — libsmartcard, 305  
 socket — Internet Protocol family, 390  
 sockets local interfaces — if.h, 62  
 sockets local interfaces — if, 62  
 sockets library — libsocket, 306  
 spawn — spawn.h, 394  
 spawn — spawn, 394  
 spawn.h — spawn, 394  
 stack environment declarations —  
   setjmp.h, 377  
 stack environment declarations — setjmp, 377  
 standard buffered input/output — stdio.h, 407  
 standard buffered input/output — stdio, 407  
 standard library definitions — stdlib.h, 409  
 standard library definitions — stdlib, 409  
 standard symbolic constants and types —  
   unistd, 444  
 standard type definitions — stddef.h, 399  
 standard type definitions — stddef, 399  
 stat — data returned by stat system call, 395  
 statvfs — VFS File System information  
   structure, 397  
 statvfs.h — VFS File System information  
   structure, 397  
 stdbool — boolean type and values, 398  
 stdbool.h — boolean type and values, 398  
 stddef — standard type definitions, 399  
 stddef.h — standard type definitions, 399  
 stdint — integer types, 400  
 stdint.h — integer types, 400  
 stdio — standard buffered input/output, 407  
 stdio.h — standard buffered input/output, 407  
 stdlib — standard library definitions, 409  
 stdlib.h — standard library definitions, 409  
 STREAMS interface (STREAMS) —  
   stropts.h, 413  
 STREAMS interface (STREAMS) — stropts, 413  
 string — string operations, 411  
 string operations — string.h, 411  
 string operations — string, 411  
 string operations — strings.h, 412  
 string operations — strings, 412  
 string.h — string operations, 411  
 string pattern-matching library — libgen, 149  
 strings — string operations, 412  
 strings.h — string operations, 412  
 stropts — STREAMS interface (STREAMS), 413  
 stropts.h — STREAMS interface  
   (STREAMS), 413  
 Sun Solstice Enterprise Agent Component  
   library — libdmici, 138  
 Sun Solstice Enterprise Agent DMI library —  
   libdmi, 137  
 Sun Solstice Enterprise Agent library —  
   libssagent, 308  
 Sun Solstice Enterprise Agent Management  
   library — libdmimi, 139  
 Sun Solstice Enterprise SNMP library —  
   libssasnm, 309  
 syslog — definitions for system error  
   logging, 418  
 syslog.h — definitions for system error  
   logging, 418  
 system error numbers — errno.h, 42  
 system error numbers — errno, 42  
 system name structure — utsname.h, 456  
 system name structure — utsname, 456  
 system calls, — stat, 395

system library — libsys, 310

## T

tar — extended tar definitions, 420  
tar.h — extended tar definitions, 420  
tcp — definitions for the Internet Transmission Control Protocol (TCP), 422  
tcp.h — definitions for the Internet Transmission Control Protocol (TCP), 422  
termios — define values for termios, 423  
termios.h — define values for termios, 423  
tgmach — type-generic macros, 428  
tgmach.h — type-generic macros, 428  
threads — pthread.h, 364  
threads — pthread, 364  
threads library — libthread, 320  
time — time types, 433  
time types — time.h, 433  
time types — time, 433  
time.h — time types, 433  
timeb — additional definitions for date and time, 432  
timeb.h — additional definitions for date and time, 432  
times — file access and modification times structure, 435  
times.h — file access and modification times structure, 435  
TNF probe control library — libtnfctl, 322  
type-generic macros — tgmach.h, 428  
type-generic macros — tgmach, 428  
types — primitive system data types, 437  
types.h — primitive system data types, 437  
types32 — fixed-width data types, 436

## U

the UCB compatibility library — libucb, 324  
ucontext — user context, 440  
ucontext.h — user context, 440  
uio — definitions for vector I/O operations, 441  
uio.h — definitions for vector I/O operations, 441  
ulimit — ulimit commands, 442

ulimit commands — ulimit.h, 442  
ulimit commands — ulimit, 442  
ulimit.h — ulimit commands, 442  
un — definitions for UNIX-domain sockets, 443  
unistd — standard symbolic constants and types, 444  
user accounting database definitions — utmpx.h, 455  
user accounting database definitions — utmpx, 455  
user context — ucontext.h, 440  
user context — ucontext, 440  
user mailbox lockfile management library — libmail, 182  
utime — access and modification times structure, 454  
utime.h — access and modification times structure, 454  
utmpx — user accounting database definitions, 455  
utmpx.h — user accounting database definitions, 455  
utsname — system name structure, 456  
utsname.h — system name structure, 456

## V

values — machine-dependent values, 457  
vector math library — libmvec, 247  
verify program assertion — assert.h, 36  
verify program assertion — assert, 36  
VFS File System information structure — statvfs.h, 397  
VFS File System information structure — statvfs, 397  
volume management library — libvolmgt, 330

## W

wait — wait status, 459  
wait status — wait.h, 459  
wait status — wait, 459  
wait.h — wait status, 459  
wchar — wide-character handling, 461  
wchar.h — wide-character handling, 461

- wctype — wide-character classification and mapping utilities, 463
- wctype.h — wide-character classification and mapping utilities, 463
- wide-character classification and mapping utilities — wctype.h, 463
- wide-character classification and mapping utilities — wctype, 463
- wide-character handling — wchar.h, 461
- wide-character handling — wchar, 461
- wide character library — libw, 331
- word-expansion types — wordexp.h, 464
- word-expansion types — wordexp, 464
- wordexp — word-expansion types, 464
- wordexp.h — word-expansion types, 464

## **X**

- X/Open Networking library — libxnet, 335
- semaphore facility — sem, 375
- XSI interprocess communication access structure — ipc.h, 68
- XSI interprocess communication access structure — ipc, 68
- XSI message queue structures — msg, 358
- XSI semaphore facility — sem.h, 375

## **Y**

- yacc library — liby, 338
